Re: Proposed Metro Regional Connector Transit Corridor

Thank you for the presentation on the Proposed Regional Transit Connector Corridor by Metro at the recent Little Tokyo Community Council meeting which was held at the Japanese American National Museum. We appreciate your outreach to the community and your invitation to receive comments from the community.

I wish to hereby submit my personal comments and concerns regarding the proposed two and the third, "no build," alternatives. I hope that I may be pardoned for my passion for my personal perception of how this proposed project would impact the Little Tokyo community. My concerns are as follows:

1. The impact on the vehicle and pedestrian traffic on the intersection at 1st and Alameda, where the eastbound train will egress from the underground tunnel at the southwest corner and cross diagonally over the intersection to the northeast corner.

2. The safety factor at the 1st & Alameda intersection for both vehicular and pedestrian traffic

3. Impact on the traffic flow on 1st Street - eastbound and westbound - the main artery of Little TokyoThe impact this intersection has on the Little Tokyo community. It would split the community, as we know it now, in half.

4. The impact this project would have on the Little Tokyo community, both physically as well as environmentally and threaten the quality of life in Little Tokyo

5. According to the Metro Overview on the website, the following Benefits of the Regional Connector are listed:

" The Regional Connector benefits the entire Los Angeles County region - not just Downtown.*

** The Regional Connector will enhance Metro Rail service by providing one continuous trip between the Pasadena Gold Line and Blue Line, and between the Eastside Gold Line and Expo Line.*

** The Regional Connector will minimize the need for transfers, reducing one-way light rail trips across the County by 10 - 30 minutes or more.*

** The Regional Connector will reduce station crowding, especially at peak hours.*

** The Regional Connector will provide new access to Downtown attractions as well as regional destinations.*

** The Regional Connector will increase regional mobility.*

The Regional Connector will enable all Los Angeles County rail and bus transit as well as all intercity transit service to operate more efficiently and attract higher ridership, thus reducing roadway congestion, improving regional air quality and reducing the region's carbon footprint

Nowhere in this overview does it state what, if any, impact this project would have on the Little Tokyo community. I submit herewith the concerns I have with this proposed project:

As I understand it, the following train lines would connect at 1st and Alameda through Little Tokyo by providing continuous through service between the destinations served by the Gold, Blue and Purpole Light Rail Train lines:

Gold Line - Presently from Pasadena to East Los Angeles (Monterey Park) - opens 2009. Westbound trains from Monterey Park would turn right and stop at Little Tokyo/Arts District, on Alameda Street, northeast corner, travel northbound to Union Station for connecting trains, and travel on through Chinatown and then to Pasadena.

Propose that

- Gold Line Train 1 - Coming from ELA would turn right, then travel northbound to Union Station and Pasadena
- Gold Line Train 2 - Coming from ELA would travel directly through Alameda intersection at Street Level through Little Tokyo and travel westbound and southbound to Long Beach
- Gold Line Train 3 - from ELA would travel directly through 1st & Alameda in Little Tokyo on street level and travel westbound to Culver City

Blue Line - Propose that:

- Blue Line Train 1 - From Long Beach, now ending at 7th St. Metro, would continue to travel through to Little Tokyo, then egress to street level at 1st & Alameda, stop at Little Tokyo/Arts District Station - then travel northbound to Pasadena

- Blue Line Train 2 - From Culver City/ Westside LA to continue through Little Tokyo, egress to street level on 1st & Alameda and travel eastbound to East LA / Monterey Park

Purple Line - Propose that:

- Purple Line Expo Line (1) from Westside (Culver City) go through Little Tokyo, subway and egress at 1st & Alameda to street level, then travel eastbound at street level to East LA
- Purple Line Expo Line (2) from Westside (Culver City) go through Little Tokyo, egress to street level to 1st and Alameda and then stop at a platform for passengers, then travel eastbound to Pasadena

All of the above 7 train lines (14-both ways) with different destinations would cross over diagonally, both eastbound and westbound, at street level, at the intersection at 1st & Alameda. We were told that the trains would cross over the Alameda and 1st Street intersection approximately every 2- 1/2 minutes both ways, or 25 trains in one hour (2.25 minutes).

If the above is true, 1st & Alameda would then be known as a major street level "hub" for Metro Trains, and not known as an intersection of Little Tokyo. It would, in effect, be an area that people would avoid, whether driving or walking, because it will be considered dangerous and too busy with train traffic. The Historic Little Tokyo would be divided in half, and split from each other at this vital intersection.

1. Impact / Concerns / Questions - on the 1st & Alameda Intersection

The intersection at 1st and Alameda is the key intersections of Little Tokyo, and it is vital to the economic and, even to a great degree, to the spiritual life of Little Tokyo. All traffic entering Little Tokyo would be interrupted on 1st Street at Alameda Street if the Metro trains were to cut diagonally across this intersection every 2-1/2 minutes.

I am concerned that there would be no benefit to Little Tokyo Community, with the trains egressing to street level to cross diagonally of 1st And Alameda every 2-1/2 minutes, and also with the westbound trains crossing over to enter the tunnel. The environmental impact on the noise for this intersection would negatively affect the residents living on the southeast corner of the intersection, as well as disrupt pedestrian and vehicle traffic tremendously.

I would imagine, in my opinion, that if this were to be proposed at any downtown street intersection, i.e. 7th & Flower, the hue and cry of objections by the businesses affected would be loud and immediate to such a hub at a street-level intersection. I cannot imagine that such an intersection would be acceptable in Downtown Los Angeles.

At least at the 7th & Metro hub, as it operates now, the Red Line and Blue Line meet underground, on two (or three?) different levels, and transfers occur below street level for the connecting trains. Although I have seen how busy it gets with people transferring to connecting trains, the intersection above on 7th & Flower is not adversely affected by the hub below. This would not be the case at 1st & Alameda.

It is hard to imagine how a tri-level underground situation at 7th & Flower can be transferred to a street level (one level) to handle all of the trains coming through. It sounds impractical, and would also be confusing for the riders who want to transfer at 1st and Alameda at the Little Tokyo / Arts District Station, to get off and find the trains that they want to transfer to. And also to connecting buses and the DASH. The 7th and Metro underground platform is very crowded with hundreds of passengers transferring connections. How can this large amount of riders be accommodated on the small platforms designed for the Little Tokyo / Arts District Station?

- How would a person, for example, coming from Long Beach on the Blue Line, go to East LA? Will there be a platform for eastbound trains across 1st Street (will there be another platform built?) for riders to get off or on to the Blue Line ? Where will the platform be built for westbound riders on Blue Line and Purple Line? Will there be additional tracks built to service these lines at the intersection?

- If the trains egress from the Office Depot area, how much room will the trains need to make that turn and stop at the Little Tokyo / Arts District Station?

  -How slow or fast will the trains be traveling as they approach the Little Tokyo/Arts District station?

  - How many segments in one train? How long will it take the train to pass through the intersection?

  -Will more property need to be acquired to handle the "hub" of trains coming from all the different directions traveling to so many different destinations?

- With a train count of 2.25 headway on 4 lines going through the intersection, how was the headcount determined?

- Will the train run on 2 tracks across 1st and Alameda at street level for all of the projected trains coming through the intersection? Or will more tracks be added?

- The auto /bus traffic on surface street crossing East / West on 1st Street at Alameda would be extremely slow, if at all possible, with a very heavy back-up on 1st Street, a major thoroughfare and entrance into Little Tokyo.

- It would be extremely difficult, and a tremendous liability to allow pedestrians to cross over 1st Streets and Alameda Street, east/west and north/south.

- How much time will pedestrians have to cross in any direction?

- If you are bringing in more trains, you will need more switches and more room to accommodate those switches (at least 2 switches for each train you intend to run in each direction) which means it will take more room for the extra switches. Would this also mean more maintenance for the tracks?

- You will need more room for transfer of passengers at this intersection. Will you build more platforms? Where ?

- How does one get across the tracks to gain access to train on next track? Will trains heading to East LA, be able to leave passengers on platforms at 1st and Alameda? Where?

- With all of the connector trains, and with so many transferring passengers, would it not be detrimental to passengers changing trains, not knowing where to transfer or where to catch the next train of their choice; creating confusion on the platforms. I envision a very crowded, chaotic situation at this transfer / loading / unloading point.

- How high will the electric lines be above the trains coming out of the tunnel crossing over 1st & Alameda at street level ? How will Metro be able to build a pedestrian cross-over bridge if the electric lines are so high above the trains? Will this bridge be covered to protect pedestrians from rain? Will it be earthquake safe?

- The main concern here is how can pedestrians get from one side of 1st Street to the other side? Will one have to walk to 2nd Street - or Temple Street to cross over Alameda?

- How will a person cross parallel across Alameda - from the southeast corner to the northeast corner? Will they have to cross over the tracks? The same goes for pedestrians from the northeast corner to the northwest corner. How many tracks would pedestrians cross over?

- Will the train come at the same speed out the tunnel, or will the train first stop underground, in the tunnel, before climbing to the street level to egress out of the tunnel. Will the engineer be able to see the cross traffic ahead from a monitor ? Will the train stop before entering the intersection? Will it have traffic lights?

- What if a pedestrian - a child or elderly citizen - stumbles and falls on the tracks. With 2-1/2 minutes between trains, I would imagine a person becoming frozen and panicky. Will the engineer be able to stop in time and avoid a collision with the pedestrian?

- The pedestrian cannot see any train in the tunnel and coming out of the tunnel and how soon a train is arriving. What safeguards will there be to make sure that no one is in the crosswalk? What if someone tries to "beat the train" and doesn't see the oncoming train? Will the engineer be able to stop in time?

I would prefer to see a plot plan, or preferably a model to see what would happen at that intersection

2. Safety Factor

Even as I am concerned about the preservation of the quality of life of Little Tokyo, I am even more concerned for the safety factor for pedestrians at this intersection:

- Would the Board of Directors of the Los Angeles County Metropolitan Transit Authority be able to assure 100% safety of pedestrians at this busy intersection?

- What would happen if a child, distracted by noise or something shiny on the ground, or an elderly person who cannot see or hear too well, or an indigent person crossing against the light, suddenly looks up to see a train coming out of the tunnel, a few feet away, and coming towards them? Would the train engineer be able to stop in time?

I fear for these very vulnerable people - the children, the seniors who are often handicapped and elderly, the indigent person who crosses the street at 1st and Alameda at all hours of the day and night. They would not be able to see the trains approaching out of the tunnel. The train would suddenly appear as it comes out of the tunnel only a few feet away, and people would be unable to react and move of the way in time.

I believe that people will be hesitant to bring their children, older seniors on trains because of the danger of so much train traffic coming through the center of Little Tokyo's busiest intersection.

3. **Impact on the Traffic on 1st Street, and 2nd Street**

- **First Street is the main artery for Little Tokyo**. 2nd Street is also another busy artery, and on Third Street there are many residential complexes both for seniors and non-seniors. There is also a large medical complex on Third Street with the Pacific Commerce Bank at street level.

Little Tokyo on the eastside of Alameda houses the following:

- Los Angeles Betsuin (Nishi) Buddhist Temple
- Zenshuji Buddhist Temple
- Maryknoll Japanese Catholic Church
- Japanese restaurants and businesses
- Large residential complexes
- The Nikkei Center, a proposed 360-unit mixed-use development, is planned for the northeast corner of 1st and Alameda.

Little Tokyo on the westside of Alameda. north of 1st Street

- The Japanese American Natonal Museum
- The MOCA Geffen Contemporary Museum
- The East West Theatre and Union Arts Building
- Many restaurants, businesses, galleries, hotels and residential housing (mostly for seniors)

Little Tokyo on the westside of Alameda, south of 1st Street

- The Japanese American Cultural & Community Center & Plaza
- The Japan America Theatre
- A large medical building
- The Japanese Village Plaza
- Centenary Methodist Church
- Union Church of Los Angeles
- Zenshuji Buddhist Temple
- Little Tokyo Branch City Library
- Casa Heiwa, the Little Tokyo Towers, Miyako Gardens, Little Tokyo Villa, Teramachi Condominums and many other senior housing residences.
- Many restaurants, offices, businesses and government offices
- Soon to be built mixed use residential and business complex on "Block 8" (2nd/3rd/San Pedro/Los Angeles Street)
- Also in planning stages: Little Tokyo Recreation Center for youth, seniors and Little Tokyo community residents

As noted, the trains at the intersection of 1st and Alameda would split the Little Tokyo community in half. Little Tokyo is a walking community and many of Little Tokyo's residents are elderly and handicapped eyesight and hearing, and it would be difficult for pedestrians to cross over the 1st and Alameda intersection with trains crossing every 2.25 minutes.

- How would traffic flow on 1st Street, either / or / both eastbound and westbound? Will vehicular traffic be re-routed to 2nd Street or Temple Street to cross over 1st Street? Or, if it is allowed, will there be rail traffic gates going up and down? Would eastbound traffic on 1st Street be allowed to turn right?

- The bus traffic on 1st Street would also add to the tremendous back-up on 1st Street at this 1st & Alameda intersection. Overflow traffic on 2nd Street would also be heavy, and traffic would clog intersections and streets around Little Tokyo.

4. Lack of Available Parking Spaces Would Become Even More Critical

The 200-space parking lot on 1st and Alameda and Central Avenue is vital for the economic life of the Little Tokyo community. At the present time, there is already a parking space availability crisis in Little Tokyo. If this parking lot were to be taken away by Metro for the tunnel egress site, Little Tokyo would lose 200 more parking spaces.

This long-standing parking lot is important to sustain the economy that is once again beginning to improve in Little Tokyo with events at the Japan America Theater at the Japanese American Cultural and Community Center, on the south side of 2nd Street, and on the north side of 2nd Street, the East West Theater and the Japanese American National Museum, MOCA Geffen Contemporary are major attractions in Little Tokyo. These institutions and the many Buddhist Temples and Christian Churches in the area once again are thriving with people from all areas of the Greater Los Angeles County, and from Southern California coming to Little Tokyo. This is a place that welcomes visitors from all over the world who come to Little Tokyo for events/weddings and funerals, and celebratory yearly events such as Nisei Week, the Obon Festivals and Children's Day activities.

All of these events, institutions and businesses would suffer from a lack of available parking spaces.

5. Background / History / Effect on Future of Little Tokyo

Little Tokyo has been located in this same area since the first businesses opened in the late 1800s. It has grown physically and economically, and survived through a series of events that threatened the existence of Little Tokyo.

From the time my parents arrived in the United States in 1900 and settled in Los Angeles, and as a child growing up in Little Tokyo before WWII, Little Tokyo has served as a very special cultural and historical and educational place for many like myself, who grew up learning the traditions and culture of Japan.

Then, owing to the special provisions of the now infamous Executive Order 9066, Little Tokyo was disseminated and demolished during World War II as the Japanese and Japanese Americans were forcibly moved out in the mass evacuation in 1942. Businesses were closed down, and residents lost their civil rights, and against their will, sent to live in America's Concentration Camps. (In fact, the corner of 1st and Central, one block west of 1st and Alameda, was the gathering / departing point for hundreds and thousands of Japanese families (our family was among those families) being sent by bus to Santa Anita and Pomona Assembly Centers.

After the end of WWII, the Japanese / Japanese Americans were allowed back into California, and many resettled in what was once Little Tokyo, and again they invested their time and money and were determined to rebuild Little Tokyo. It took a lot of sweat and endless hours of back-breaking effort to bring the community back to a successful and thriving community.

Then, again, around 1947-50 the City of Los Angeles took away a large portion of Little Tokyo to build the City's Police Headquarters at Parker Center. Again, businesses and buildings were demolished or displaced, closed and or moved to other areas in Los Angeles, Gardena, East Los Angeles and San Fernando Valley. Much of Little Tokyo was lost to the City.

Little Tokyo survived, and is now coming back again to thrive once more as a vibrant7community. There are new businesses and restaurants along Central Avenue, 2nd Street, and 1st Street. This vibrant street of businesses and restaurants would be demolished with the proposed Underground Tunnel Exit on the block bounded by 1st & 2nd, Alameda and Central Avenue. Many small businesses and restaurants on 2nd Street would be unable to survive the many years of construction, traffic obstacles, noise and air pollution.

6. Future of Little Tokyo

In 2007, Little Tokyo was officially designated by the State of California as one of the three remaining Japantowns in California. (San Francisco and San Jose and Los Angeles). There have been capital improvements and many new residents moving in, and discussions were held in the Community for planning and design guidelines. The discussions continue today as the LTCC Planning and Cultural Preservation Committee meet with the City Planners for the design and planning guidelines for the future Little Tokyo and Downtown Los Angeles.

The week-long Nisei Week Japanese Festival, held in August each year, celebrates the businesses, people and culture of Japan. Nisei Week began in the mid-1930s and with the absence in the War years, it has continued to bring thousands of visitors to Little Tokyo, and this year will celebrate its 69th year. Thousands of visitors come to Little Tokyo each year to celebrate Nisei Week, as well as the Buddhist Temples' "Obon" Festivals and other special events all year around.

Many have continued to bring their children and grandchildren to shop, eat and play and work in Little Tokyo. In the near future, the Little Tokyo Recreation Center, which will be built soon, will become the center of Japanese American youth activities.

Now, once again, the quality of life in this quaint Historic Little Tokyo in Downtown Los Angeles is being threatened.

Because of the uncertainty of the conditions caused by construction, the proposed project would keep people from coming to Little Tokyo during and after construction, and the economy and the vibrancy of Little Tokyo would suffer greatly. Many of the Little Tokyo small businesses would be devastated, and unable to survive the long period of construction.

The Little Tokyo community is very small in area and very fragile. It is vulnerable to any sudden changes and long-term construction such as for the Transit Corridor Connector.

What a shame it would be for the City of Los Angeles to lose the vibrancy and the economic vitality and the cultural quaintness of Little Tokyo.

And what a tragedy it would be for a pedestrian to suffer the tragic consequences of an ill-designed, unsafe planned intersection.

Therefore, I would respectfully urge that the Metro Board vote "No" on Metro Transit Regional Corridor Connector Underground Alternative - and urge the Metro Board to not build an underground emphasis with trains coming out of a tunnel on the southwest corner of 1st and Alameda to cross diagonally for eastbound and westbound trains at street-level at this busy vehicular and pedestrian intersection in the middle of Little Tokyo.

I would urge that the Metro Board consider the either the "no build" alternative and have the trains meet at the hub in Union Station, and use shuttle buses or DASH to connect passengers for transfers.

Or, I would urge the Metro Board to vote for the At-Grade Alternative to travel along Temple Street which is the northern edge of Little Tokyo. The employees in the government offices, or visitors that have business at government offices on Temple Street and Civic Center area, could potentially leave their cars at home and travel through the Metro system and arrive at their destinations in the Civic Center area and Temple Street offices; thus, saving the environment from more cars traveling to daily destinations. This would leave more parking spaces available for customers of businesses in Little Tokyo and downtown area. This would also leave Little Tokyo area intact from being split in half.

As one travels through Civic Center and Little Tokyo, at street level, the life of the City can be seen on Temple Street; and in Little Tokyo, the East West Theatre, the Union Arts Center, the Go For Broke 442nd Memorial Monument and National Education Center, MOCA Geffen Contemporary and the Japanese American National Museum and the National Center for the Preservation of Democracy would be seen from Temple Street.. If the hoped for Art Park is built, the many travelers on the Metro trains at street level on Temple Street would pass by this park.

When I ride the subway (Red Line) from the Universal City Station to Union Station, I do not see any of the City above ground. I miss seeing the different neighborhoods. Subway is a good way to get around quickly, but you lose the connection to the various diverse neighborhoods in Los Angeles.

And Los Angeles is a beautiful City; a beautiful patchwork quilt of diverse neighborhoods. We should preserve and protect all of these neighborhoods.

Thank you again for inviting our comments and considering our concerns.

Respectfully submitted

comments:

I like the details and strategic location of the Regional Connector-Downtown. Many passengers can ride it, because it connects to the Tokyo Arts District, the Red/ Purple, and Expo Lines. All in all, it can be named the "L" (aka. The LA Loop).

comments:

We support the Regional Connector project. We urge Metro to move forward with final environmental clearance and build this proposed Light Rail project mostly underground from 7th/Metro to Little Tokyo ASAP. The Regional Connector will have high initial traffic because it will link passengers from the Expo Santa Monica / Long Beach Blue Lines under downtown LA to the Pasadena Gold and East LA lines. We support the "Underground Emphasis LRT" option over the proposed surface alternatives. The underground option will be safer and quicker and impact downtown traffic less during construction. The Regional Connector should be a key project in the funded category of the upcoming MTA/SCAG Long Range Transportation Plan for LA county. Building a vehicular tunnel for Alemeda St. would improve safety for pedestrians, trains, trucks, and cars near 1st St / Little Tokyo Metro station. We believe this project is worth the estimated AA report cost (about $900M). Modern deep bore tunneling equipment/techniques should reduce actual total costs if construction can be initiated ASAP. Convenient links at each proposed new station should be provided for pedestrians, bikes, and bus transfers to LRT.
Thanks and good luck!

Please include a Little Tokyo stop if underground between Los Angeles and San Pedro on second (1st choice) and at least Temple and Judge Aiso if Temple surface is selected (the stops along this roue are not convenient to Little Tokyo)

Greetings-

I wanted to quickly add my two cents regarding the downtown connector project.

This project MUST be placed underground.

Downtown is already a vortex of traffic congestion and an on-grade train will only hinder that more.

We've also already seen what on-grade rail does to slow rail traffic flow with the gold line. This connector will be among the most heavily trafficked rail passages in the county if completed. This project is all about speed and fluidity, which will go out the window if implemented in such a way.

In addition, this project is about a much grander scheme in which Los Angeles is trying to build a world class rail system capable of meeting the demands that will be placed on the city in the coming decades. Anything running above ground through downtown will not stand to meet these demands. Do it right the first time and don't regret it later.

-Garrett Sergeant

The Underground Emphasis LRT alternative is vastly superior and well worth the additional cost:
- the wye connection at the Gold Line maximizes operational flexibility
- the lack of traffic and pedestrian conflicts allows minimal headways and travel times
Both of these features would greatly increase the utility of the existing Blue, Gold and Red lines, much more than would the No Build, TSM, or At-Grade Emphasis LRT alternatives.

Subject: Regional Connector Transit Corridor

As I am unable to attend the numerous “public scoping” meetings to give input on the proposed Corridor, there is one very important point I’d like to make.

Please put me on record as a resident of Los Angeles County who opposes any surface transportation being added to our already congested streets.

The corridor is not only essential, it is most welcome, and long overdue!

However, let’s keep in mind that our already overstressed streets and freeways cannot support any added transportation and that includes the Connector.

The Connector must be built underground.

Let’s keep the noise, the congestion away from our already congested streets and freeways.

Thanks for your careful attention to my input.

Sincerely,

Re:
Regional Connector Transit Corridor Project
Underground Emphasis LRT Alternative

I attended the community meeting at the Japanese American National Museum on Wednesday, April 1, 2009, and submitted a comment. This is an additional comment.

Please consider the feasibility of adding a station in the middle of 1st Street, between Alameda Street and the 1st Street Bridge, adjacent to the Little Tokyo/Arts District Station that will soon open. Thus, the East L.A./Culver City line would not bypass this Little Tokyo/Arts District intersection.

Possibly, the station would be similar to Blue Line stations along Washington Blvd., where passengers walk across half the street to access the platform. Transfers would be possible between the East L.A./Culver City line and the Pasadena/Long Beach line by walking across half of 1st Street.

Subject: Comments About Metro: Regional Connector

Hello,

I strongly support a grade-separated (underground) alignment of the regional connector project. At-grade rail in downtown Los Angeles was a factor in the original decline of the LA streetcar system. At-grade rail may be cheaper, but it is slower, more dangerous, causes delays for motorists, and causes trains to honk at intersections, creating unnecessary noise pollution.

While I am aware that Metro operates under budget constraints I often feel like you pursue maximum rail system miles at the expense of system quality. I would prefer to see an exclusively grade-separated rail system going forward, even if it is less extensive. Only by focusing on system quality can you hope to attract a broader base of riders.

The system already has a broad scope through busses, the issue is quality. Rail should be the freeway of transit.

Metro:

My name is Rich Alossi, a resident and worker in Downtown LA, and I wanted to voice my support for the Project.

I also support the UNDERGROUND/BELOW GRADE alternative above all else, as this is the only way to ensure speedy, safe connectivity with the rest of the Metro Rail system and plan for long-term transit alternative planning.

Thank you for your consistent leadership in building up the future of LA!

To the MTA:

I've been a resident of Little Tokyo at the Savoy on Alameda and 1st for the last 3 years. I'd like to express deep concerns with both of your rail connector proposals (at-grade and below-grade). The biggest concern is with the underground rail proposal which would surface across the street from my building. Construction would wipe out 7 businesses that I frequent (particularly Starbucks, Yogurtland, Office Depot, Weiland's Brewery, and Senior Fish). The block is a hub of activity right now even into the midnight hour on weekdays and removing those stores will be a detriment to the community. Replacing successful businesses with a staging ground/construction site for 3 years (at least) does not in the least appeal to me especially when there is no guarantee that when MTA is done that those stores and that hub of activity will return. I am aware that MTA Rail projects have improved sites with rail stations and development to better the community- but I would argue that this is not a run-down block that is easily made better. On the contrary, tearing this block out represents tremendous loss of business and local community and culture in Little Tokyo, both in the

short-term and long-term. Traffic is another huge concern. Alameda is a heavily trafficked corridor with stop and go traffic at rush hour. How does it make sense to have trains crossing the intersection at 1st and Alameda to add to that? To me, it represents a traffic nightmare not only during construction, but after it is finished as well when trains will be added into the mix.

The above-ground option is not much better although it is not as disruptive to the community in Little Tokyo. Adding rail on Temple St. will significantly impact commuter traffic (downtown workers trying to reach the freeway onramps on Alameda).

I really am pro-public transit and supportive of MTA's efforts. However, I cannot suppport these proposals in their current form and without promise of extensive mitigation. I feel like these solutions are compromising to the existing local community and need more thought or ideas in terms of design and planning.

Thanks,

Paul Yeh
Resident of Little Tokyo

THE CONNECTOR IS BEING PLACED/PLANNED IN THE WRONG AREA!! MILLIONS OF DOLLARS WOULD BE SAVED IF THE LINE WERE TAKEN STRAIGHT DOWN ALAMEDA STREET TO WASHINGTON BLVD., HEADING WEST ON WASHINGTON WITH A WYE CONNECTION TO THE BLUE LINE TO LONG BEACH AND 7TH & METRO CENTER! ANOTHER WYE CONNECTION COULD CONNECT WITH THE EXPO LINE TO SANTA MONICA!! TWO STATIONS COULD BE PLACED @ 7TH STREET AND OLYMPIC BLVD. AND THERE WOULD BE NO EXPENSIVE TUNNELING INVOLVED!?!

Metro

alternative would have a single at-grade crossing at the intersection of 1st and Alameda Streets. The rest of the route would be underground. The length of this proposed route would be 1.6 miles.

Station locations for this alternative would all be underground and include the area north of 5th Street on Flower Street, adjacent to Bunker Hill just south of 2nd Street and 2nd Street between Los Angeles and Main Streets.

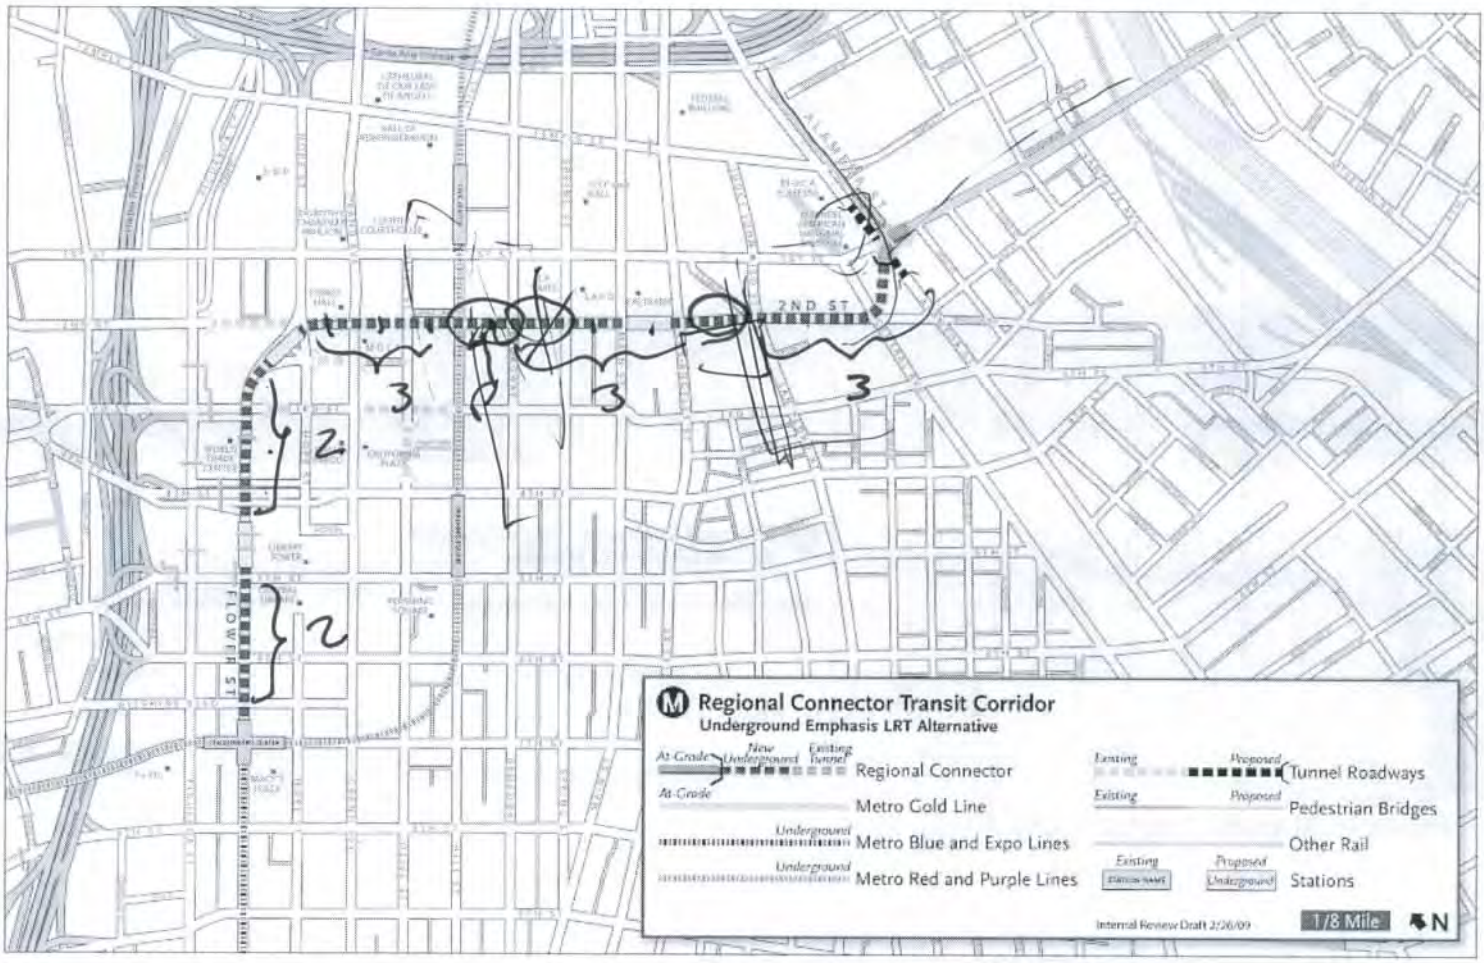

Figure 2: Underground Emphasis LRT Alternative

Preliminary Schedule

The preliminary schedule is provided below for discussion at the agency scoping meeting.

Written comments will be accepted until May 11, 2009. Comments may also be submitted at the scoping meetings, sent via email to regionalconnector@metro.net, or mailed to:

THE UNDERGROUND ALTERNATIVE IS PREFERRED BECAUSE IT WILL MINIMIZE LONG-TERM IMPACTS ON DOWNTOWN LAND USE AND SURFACE STREET CIRCULATION and WILL GENERATE GREAT POTENTIAL FOR SEVERAL PUBLIC/PRIVATE JOINT DEVELOPMENT PROJECTS, INCLUDING BUNKER HILL/DISNEY HALL/GRAND AVE., THE SOUTH-WEST and NORTH-EAST CITY BLOCKS AT 1st & ALAMEDA'S LITTLE TOKYO/ ARTS DISTRICT WHICH WILL ALL GENERATE FISCAL REVENUES TO HELP PAY FOR CONSTRUCTION COSTS DEBT SERVICE OVER TIME.

THANK YOU! [signature]

Expo line approval: A license to kill?

By Najmedin Meshkati and Robert "BJ" Takushi

Updated: 01/26/2009 05:23:37 PM PST

The Metrolink crash in Chatsworth on Sept. 12, which killed 25 and injured more than 135 innocent people, highlighted the need for much more rigorous government scrutiny of rail safety in the country and especially in Southern California. It is against this sober backdrop that we -- the badly hit Southlanders -- are pleading and looking up to the north for a protector from future rail carnages.

This Thursday, Jan. 29. the five commissioners of the California Public Utilities Commission are expected to vote on and announce their final decision concerning the design of key street crossings in phase 1 of the Exposition Light Rail, or Expo Line, project planned from downtown Los Angeles to Culver City. It will cross major busy city streets such as Vermont, Western, Farmdale and Crenshaw.

There are rare occasions that a San Francisco-based state agency's decision can determine the risk to life and safety of millions school children in Los Angeles for the next 75 to 100 years. However, this CPUC's decision will be a precedent-setting case and there certainly will be future similar cases elsewhere in California, and as such, many more lives will be at risk.

In fact, the term "light rail" is a bit of a misnomer. Each of the three-coupled 225-ton train cars will operate at speeds of up to 55 miles per hour. Expo Line trains will run every 2 to 2.5 minutes, 22 hours a day, in opposite directions on parallel sets of dual tracks and will cross Farmdale Avenue at street level (at-grade), within 10 feet of Dorsey High School, which has 2,100 students, and will cross Western Avenue and Harvard Blvd., also at street level, within 50 feet of the Foshay Learning Center, which is a K-12 Multi-Track School with 3,400 students.

The L.A. Country Metropolitan Transportation Authority and its Exposition Light Rail Construction Authority with their army of lawyers, consultants, lobbyists and PR agencies, which are all paid from our tax money, are vigorously pushing and asking for CPUC approval of their at-grade crossings near the two schools. However, the local community organizations and the Los Angeles Unified School District are opposing such at-grade design of intersections. The public's distrust of MTA is rooted in its dismal safety record. Ninety people have died on the MTA's 22-mile L.A.-Long Beach Blue Line, which has had more than 821 recorded incidents since its inception in July 1990 to July 2008. These numbers, which are significantly higher than national average rates of accidents and fatalities along the MTA rail network, attest to the dire state of rail safety in LA, which is primarily caused by MTA's outdated and messy safety-related policies, procedures and practices.

If the CPUC has not learned its lessons about the human factors-related root-causes of past rail

accidents, and does not fully scrutinize MTA's proposed crossings' risk and hazard analyses, then CPUC's "easy" approval will be tantamount to granting MTA and its Expo Line Construction Authority a license to kill and maim school children and adults on the Expo Line for the next decades to come, as approximately 72 million Dorsey students who will use the Farmdale Avenue crossing during the expect life of operation of this line. The CPUC's approval would provide MTA with the alibi - the "design immunity" in legalese - for so doing.

The concept of "design immunity," which is based upon an otherwise obscure California Government Code § 830.6, would potentially entitle MTA to avoid liability for dangerous condition of its designs and grant MTA with complete immunity against any type of claim arising out of its design defect. It was precisely the CPUC's lax approval of the Blue Line's more than 100 crossings back in late 1980s that left us to live with the persistent dangerous condition which is a major root-cause of its many fatalities and accidents (the last two accidents happened just in one day, on Thursday, Nov. 20.)

Moreover, the automatic "design immunity" entitlement of MTA has also been responsible for the status quo, as well as stifling any motivation and imputes within this agency for any fundamental change and systematic safety improvement. Neither numerous deaths and the resulting protracted litigations, nor trail or appeal court's affirmative rulings against MTA in favor of the rail accident's victim (plaintiff), have been able to make a dent in the MTA's dismal safety practices.

This time around, the CPUC approval of MTA's requests for the Expo Line would do the same. It will not only continue to shield MTA's unsafe crossings and operation against any future lawsuits stemming from accidents and resultant injuries and deaths caused by design-induced errors of pedestrians and drivers on the Expo Line, but also will further hardened MTA's entrenched archaic safety culture.

It is truly perplexing that the Exposition Light Rail Construction Authority, even in this dismal state economy, is still continuing to squander millions of dollars of precious taxpayers' money by lavishly paying for thousands of pages of legal briefs, stubbornly fighting neighborhood community organizations, and recklessly disparaging scientific facts which justifiably question and refute its proposed designs. This is the money that should have been spent on making the Expo Line safer and our hope is that the CPUC puts an end to this vicious cycle.

The CPUC of today has much greater competent technical resources and it can (and should) learn from other agencies such as the National Transportation Safety Board and do much better job than what it did some 30 years ago and consequently we are stuck with the Blue Line's unsafe intersections. We can only hope that what the American philosopher William James said, "great emergencies and crises show us how much greater our vital resources are than we had supposed," also applies to California and its PUC.

Najmedin Meshkati is a professor at the Sonny Astani Department of Civil/Environmental and a professor at the Daniel J. Epstein Department of Industrial & Systems Engineering (ISE) at the Viterbi School of Engineering, University of Southern California. He teaches and conducts research on the safety of technological systems and created USC's Transportation Safety Program in 1992. Robert "BJ" Takushi, a recent graduate of the Epstein ISE Department, received a grant from the Rose Hill Foundation to study the Expo Light Rail safety.

I FEEL THAT THE REGIONAL CONNECTOR IS ONE OF THE MOST IMPORTANT PROPOSED LINES. IT WOULD INCREASE RIDERSHIP DRAMATICALLY AND WOULD CREATE A CONNECTED REGIONAL SYSTEM. I THINK ITS IMPERATIVE THAT THIS LINE BE BUILT BELOW GROUND. GIVEN THE DENSE NATURE OF DOWNTOWN L.A, GRADE SEPARATION WILL HAVE LESS IMPACT ON THE REVITALIZING NEIGHBORHOODS IN THE AREA. I HOPE WE CAN BUILD THIS LINE SOONER RATHER THAN LATER.

Comments/Comentarios/コメント:

I support this project. It would greatly improve mobility Downtown. The underground alternative is a must! Otherwise it would interrupt the street scape too much.

Metro should consider double tracking b/c the Blue Line is already at capacity. When the Expo Line opens, it would be a shame to have a low level of service b/c of bottlenecks downtown.

The Bunker Hill station should be moved to be centered at the Grand Ave/2nd St station. This will make it

I am extremely pleased that Metro has considered the public's opinion about future projects. Since January of this year, I have been using public transportation, and I have to say it has made me happier. It is because of the cost and the reduced stress of driving. I am in favor of any extention project. If the project may consist of an underground emphasis or an at-grade, You would probably have to consider people who live and/or work in downtown Los Angeles.

Metro

I do have to say this, and I think it is because of my age and marital status, but I feel the light rail systems in Los Angeles County and downtown should run 24 hours a day. I am in college and I enjoy going out and staying out late. I noticed that the light rails run up to mid-night or 1 A.M. In some areas of the city, buses do not run late as well. So, I will not be able to get home until 5 A.M. or well or not enjoying my night out because I will be too concerned about missing the train. I am only speaking for myself, not all college students. I would like to thank you for your time and patience will all the speakers here today (3/31/09), and to all the representatives of Metro.

Respectfully,

Metro

THE HIGGINS BUILDING at 2nd and Main since 1910

April 1, 2009

From: Higgins Building Homeowners Association
Re: Comments on proposed Downtown Regional Connector

The Higgins Building Homeowners Association would like to join our many neighborhood residents, business leaders and stakeholders to reiterate, in the strongest of terms, our support to the responsible building of the Regional Connector as a below-grade project, and our categorical objection to building it as an at-grade project.

As you consider the proposal before you, we ask that you dutifully consider the many benefits of the below-grade project over the at-grade option:

– The below-grade option will allow for greater efficiency of the regional transit system. Trains will be allowed to travel at much higher speeds underground, significantly reducing route times and allowing for more frequent trips, maximizing the efficiency of the system, allowing the MTA to better service the community and the region as a whole. In addition, it will avoid disruption of existing MTA and Dash bus routes in the area, many of which use Broadway as a key artery.

– The below-grade option will be safer. It will avoid the congestion of at-grade trains that will endanger the lives of thousands of pedestrians and motorists who cross Second Street each day. This will save the MTA and the City millions of dollars in potential legal fees and settlements over injury cases by eliminating the risk altogether. It will also be safer for residents of the area, specifically the Higgins Building. An at-grade train system will significantly compromise access by emergency vehicles to the building.

– The below-grade option will be less disruptive. An above-grade train will avoid the total conversion of 2nd Street to railroad tracks, eliminating a key east-west thoroughfare through downtown, and causing potential gridlock on adjacent east-west thoroughfares (1st Street, 3rd Street & 4th Street). It will avoid traffic gridlock on north-south streets through the area, including the major thoroughfares of Hill, Broadway, Spring, Main and Los Angeles Streets. The City stands to save hundreds of thousands of dollars on studying the retiming of traffic for this area alone. In addition it will avoid potential disruption with security operations at the new LAPD headquarters, and will cause far less noise disruption to the hundreds of new residents of the area.

– The below-grade option will encourage a pedestrian-friendly downtown. Second Street is a key pedestrian connection link between the burgeoning residential neighborhoods of the Historic Bank District, Little Tokyo and the Civic Center. The below grade option will preserve that pedestrian connection. An above-grade option would destroy that connection, especially during peak morning and evening hours by running trains – and impeding pedestrian crossings – every 2-5 minutes.

-- The below-grade option will cost the City less in the long run. A below-grade option will allow current and planned businesses along 2nd Street to operate and thrive, generating hundreds of thousands of tax dollars annually for the City and County. An above-ground option will completely cut off vehicular access (for both customers and supplies) to many existing businesses in Little Tokyo and the Higgins Building, potentially starving the City of much-needed, existing tax revenue. In addition, it will completely eliminate film revenue from the historic 2nd Street tunnel, one of the most filmed locations in the County of Los Angeles. Altogether, building the at-grade option may very well end up costing the City and County more over 20 or so years than building at below-grade.

-- Finally the below-grade option will improve quality of life for existing and future residents. A below-grade option allows the hard work and considerable investment that has already been put into the neighborhood to continue to grow and contribute to the community. The Higgins Building – a Historic-Cultural Monument – will not become isolated by elimination of critical loading lanes and the laying of tracks mere yards from the building entrance and existing thriving businesses. It will allow continued development of properties along 2nd Street, including planned restaurants on the Vibiana's property and retail on Little Toyko's Block 8.

When considering the options, it is abundantly clear that the below-grade option is a far superior option for the downtown community and the Los Angeles region as a whole – operationally, financially, and pragmatically. Saving 13% up front to build the at-grade option would not only be incredibly short-sighted, but it may end up costing the City far more in the long-run than any savings achieved up front.

There continues to be overwhelming support for the below-grade option of the Regional Connector project, from the thousands of new residents, to business and community leaders. As residents and community leaders, we at the Higgins join in that support.

Second Street is a part of the functional, historic and lively fabric of downtown. Converting it into a rail corridor would be devastating. While building this project below-grade will also create significant disruptions, we believe many of those can be mitigated. If built responsibly, this project can be an asset for downtown residents, workers and businesses as well as for cross-county travelers.

Thank you for your consideration.

The Regional Connector has been rated as Metro's most cost effective future project. The underground ~~object~~ option is the far superior one. If one train is stalled with a surface fender project, the entire light rail system would be halted. Running at 2.5 minute headways, underground is safest, most efficient, and fastest.

Breathe LA supports Metro's efforts to improve our subway system in order to mitigate air quality concerns through reduced traffic congestion. We appreciate consideration in the EIR to indicate projected smog reductions from the Underground and other proposed alternatives. Mobile air sources have been a major influencer on asthma in the Los Angeles County region and this METRO project has great potential to help alleviate harmful emissions.

Comments/Comentarios/コメント:

Alameda Street is a critical access route for JANM. The parking garage entrance is on Alameda, as is the loading dock for the Museum. (Large trucks use this for transporting exhibitions.) Therefore any construction on Alameda needs to ensure adequate open access for both JANM and MOCA. Otherwise operations would be impacted.

I think the underground option is a no-brainer. There is no way you could safely run 3 car light rail trains through downtown on the surface and NOT expect to hit or be hit by other vehicles. (What is the body count now for the Blue line?) That said, the only problem I see with pairing the legs of the Gold line with the Blue line and the Expo line is a logistical one. Folks wanting to stay ON the Gold line in either direction will have to go PAST the new Y connection to the next station before they can transfer to a train going in the direction they really want. But I'll bet you already know that. Can't wait to see what your solution is.

RE: Regional Connector Transit Corridor project
I'm a downtown resident, and unfortunately I cannot make it to the scoping meetings that you've scheduled, but I'd like to put forth some comment here. I think it's a great idea to make the subway system connect better through downtown. It will make not only the people who live and/or work here use public transit more to go across downtown or to parts farther away, but I strongly believe it will also make downtown a livelier, more accessible place for people from other LA neighborhoods that will be served by the new subway line extensions to come partake in our numerous entertainment and other cultural offerings.
I would opt for the underground emphasis alternative via 2nd and Flower Streets, because I think to have any at-grade lines would cause more gridlock on those streets around the Civic Center than what is already present there today. I would ask, though, that considerations for a station be made for somewhere like 2nd/Spring, so that those of us who live in the Old Bank District can access the line fairly easily. Ultimately, I'm sure the decision to build at-grade or underground will depend on the cost differences, but if going underground would speed up the transit, I think that's another benefit that all riders/commuters would all appreciate.

Thanks.

comments:

the regional connector is a vital link in our system. it will increase ridership dramatically because of the ease in using 1 continous line or easy transfers. with tap technology, I suggest we reinstitute transfers and make a policy of free transfers between all rail lines! the connector must be in subway to facilitate speed. thank you

Los Angeles, CA 90012

RE: SCOPING COMMENTS FOR THE REGIONAL CONNECTOR TRANSIT CORRIDOR PROJECT EIR/EIS

Dear Ms. Saltarelli,

Thank you for this opportunity to comment on the scope of the Regional Connector Transit Corridor EIR/EIS. The Los Angeles Department of Transportation (LADOT) will be serving as the lead contact agency for the City of Los Angeles on this project, and any correspondence or documents from your agency should also be sent to the Los Angeles Bureau of Engineering (LABOE), attention Mr. Gary Moore.

The EIR/EIS should include an evaluation of the traffic and on-street parking impacts of the LRT At-grade Alternative. Appropriate mitigation measures will be necessary, especially for impacts on Temple Street and Second Street resulting from the at-grade LRT alignment. Additionally, projected travel speeds for the at-grade LRT trains along the entire route should be described in the EIR/EIS.

Traffic Impact Analysis

Prior to conducting the traffic impact analysis, the underlying modeling assumptions used to develop transit ridership forecasts, including mode split assumptions, trip length and vehicular trip reductions assumptions due to increased transit ridership, need to be submitted to LADOT for review. Modeling results should include an explanation, in the main text of the EIR/EIS, of the methodology, assumptions and levels or thresholds of significance. Growth forecasts should reflect the most currently-available forecasts from Metro or SCAG, with at least a 2030 time horizon.

The Highway Capacity Manual's delay methodology should be used for the traffic impact analysis of the LRT At-grade Alternative. Critical Movement Analysis methodology should be used for analyzing station area traffic impacts resulting from the LRT Underground Alternative. LADOT's threshold criteria for significant impact using volume/capacity ratios should be used in both analyses. These ratios can be adapted to delay measurements in consultation with LADOT.

Traffic count data should be collected between September and May. Typically, summer (June-August) traffic count volumes are low due to schools being out of session and workers on vacation.

LADOT will need to approve the list of intersections for the traffic impact analysis, and this list may need to be revised based on initial model runs. Based on our review of the proposed study area intersections, all signalized intersections along Arcadia St., Aliso St., and Fourth St. within Downtown should be added to the list since they could be impacted by the proposed project when both First Street and Third Street are heavily congested.

Grade Crossings

All proposed at-grade crossings should be initially analyzed using Metro's Grade Crossing Policy. Design of grade crossings (at-grade, aerial or underground) on City streets should be made in consultation with LADOT, and final disposition of grade crossing treatments will be subject to the City's approval. Safety devices for at-grade crossings should include quad-gates and other traffic control measures. In addition, automobile speed zone areas near the proposed at-grade alignment should be analyzed.

Also, please see our previous scoping comments for the project's Alternatives Analysis (attached.)

Please contact Susan Bok of my staff at 213-972-8623 with any questions.

Sincerely,

Kang Hu
Senior Transportation Engineer

From: "Grein, George O." <GOGrein@lasd.org>
Subject: **Feedback re: Downtown Connector Scoping Phase**
Date: March 30, 2009 8:29:40 AM PDT
To: <ginny@therobertgroup.com>

Grein, George O.
Not In Address Book

Good Morning,

I appreciated the opportunity to hear the proposed plans for the downtown connector. It will be an excellent enhancement for dealing with downtown gridlock and making downtown access more readily available to rail passengers from throughout the metropolitan area.

Law enforcement does have concerns regarding the preliminary info provided. Perhaps you can respond as to the few concerns that I will express below, or ask that those responsible for fine tuning the planning to consider our perspective.

1. Similar to what will take place with the convergence of the Expo and Blue Lines at Pico Station, two separate lines (the Expo/Downtown Connector and the Gold/Blue will apparently be sharing one platform at Little Tokyo. Clearly, Pico Station was not designed for this (too narrow and cannot be lengthened). Was Little Tokyo designed to be a transfer point? Our concern is crowding and having a proper queuing design to allow for ingress/egress for all of the potential options for passengers. This becomes an additional staffing requirement, especially since the downtown area is subject to so many political protests and rallies. (One solution being studied for Pico Station was to turn it into a dual platform station, but that would require widening Flower Street). Making changes to an active revenue line are certainly challenging and potentially problematic.
2. Along the same line, the method of connecting the tracks between the new Expo and existing Blue lines at Washington and Flower has been the subject of great debate for Metro. Have the designers discussed this issue of the connection of the tracks with Metro Rail Operations (and in particular General Manager Mike Cannell)? This became an issue during construction of the Expo Line, and should have been addressed during the planning phase. Peak commute train traffic flow is the issue. For law enforcement, the concern is critical as to how traffic along two busy streets (1st Street and Alameda Street) will be affected.
3. From a security point of view, since Alameda Street is a heavy truck traffic route, our concern is about allowing vehicles to go under the track right-of-way in the immediate vicinity of a potentially crowded transfer point. A person carrying an explosive device is a challenge to us on a platform, which we can potentially alleviate by use of our canine detection teams. However, we cannot stop persons from driving a large vehicle through the underpass and detonating an even larger vehicle borne improvised explosive device (VBIED) so near to a public transit station (and a transfer point at that). While this may seem a bit dramatic, the issue of VBIED's is real enough to have the acronym due to a number of successful attacks worldwide. Has this been considered in your planning of the underpass for vehicle traffic?
4. For law enforcement, and for rail operations too, any option involving below grade (or above grade) routing of public transit, so that it does not have to cross streets with vehicles is a good option. While it is more costly in the short term, it will benefit Metro in the long run as it will eliminate cross traffic delays. Once a train comes in contact with a car or truck (or pedestrian), the system slows or stops. That not only affects those on that train, but all of those in the system. It takes time to set up a bus bridge, and in the interim, people are crowding platforms and getting frustrated with "rapid transit" – which stops being rapid. I certainly hope that the downtown connector will go underground.
5. Given the realities of the homeless/transient population in downtown, the design will at some point need to address issues of intrusion by pedestrians into any tunnel portals. That may be a little further down the line that what you are doing right now, but I did want to address this issue. On the Expo Line, that was not addressed in the design phase, and had to be added at additional Metro expense after construction started.

Those are the preliminary concerns that law enforcement has. I appreciate the opportunity to express them to you so early in the planning.

Thank you again,

George

Cc: Allen_Leslein@cacd.uscourts.gov
Subject: Comments from the U.S. District Court, Space and Facilities Department

Hello Dolores - on behalf of Allen Leslein, Chief District Architect, the following comments are submitted:

The New (Federal) District Courthouse is planned for the block bounded by Second, Hill, First and Broadway streets. The plans have been completed, the site has been cleared and Congress has appropriated nearly 400 million dollars for this project. Construction will begin as soon as a funding shortfall is addressed. This site is directly adjacent to the proposed Regional Connector Transit Corridor on Second Street.

The plans for the 1 million gross square foot courthouse call for all vehicular access to be from Second Street. This includes parking for the approximately 150 space subterranean garage, the building's loading dock and the prisoner vehicular sallyport. Significant turning radiuses are required to accommodate the large delivery trucks as well as the U.S. Marshals prisoner busses.

If the regional connector is located at grade, it will consume two lanes of Second Street, severely reducing the capacity of this street and increasing traffic congestion especially during peak rush hours when most vehicles will be entering or exiting our facility. The at grade connector may actually eliminate access to our site or require vehicles to cross two lanes of tracks resulting in significant safety concerns. Larger vehicles may be prohibited from accessing our site as the narrower public roadway
will be limiting the turning radius of these vehicles. Also it may result
in Second Street becoming a one-way street further limiting access and egress from the site, which raises security issues.

It should also be noted a street car line has been proposed for Broadway.
This would increase congestion at the intersections of Second and Broadway should the connector remain at grade. The at-grade connector will also impact vehicular traffic flow and pedestrian safety as it winds its way through the Civic Center on Los Angeles and Main Streets.

The underground alternative does not result in any of these issues and is therefore the strongly preferred option.

City of Los Angeles
Regional Connector Transit Corridor Project
Vic. LA-101/110, SCH# 2009031043

Ms. Delores Roybal Saltarelli
Los Angeles Metropolitan Transportation Authority
One Gateway Plaza
Los Angeles, CA 90012

Dear Ms. Roybal Saltarelli:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the Notice of Preparation (NOP) for an Environmental Impact Report (EIR)/Environmental Impact Statement (EIS) for the Regional Connector Transit Corridor Project. The light rail transit project would connect the future Metro Gold Line at Alameda Street and Temple Street to the Metro Blue Line and the future Metro Exposition Line at the 7th Street Metro Center Station. Based on the information received, we have the following comments:

The project will have a direct impact on the Caltrans District 7 Los Angeles downtown office building at 100 South Main Street. The alignment would involve one-way couplets on Main Street and Los Angeles Street and tracks on Second Street between Main Street and Los Angeles Street.

Metro Rail transit stations or tracks to be located along the east side of Main Street (between Second Street and First Street), on the west side of Los Angeles Street (between Second Street and First Street) and on the north side of Second Street (between Main Street and Los Angeles Street) would need to be reviewed and approved by Caltrans. LRT operating along the Caltrans building could impede building ingress/egress.

Additional considerations should address emergency evacuation of buildings around First Street, Main Street, Second Street and Los Angeles Street. An evaluation of impacts to major events such as City Hall celebrations, parades and marches, rallies and demonstrations, etc. The placement of pedestrian crossing barriers or signage should be considered for locations across the street from transit stations.

A traffic study will be needed to analyze impacts to the US-101 Freeway ramps at Alameda Street using HCM methodology. The project would involve at-grade tracks on Temple Street, with Alameda Street configured as a below grade roadway with a pedestrian overpass over the tracks.

A subway alternative along the Caltrans building will need to assess construction impacts including location of station portals.

Transport of over-size or over-weight vehicles on State highways will need a Caltrans Transportation Permit. We recommend that construction related truck trips on State highways be limited to off-peak commute periods. The contractor should agree to limit platooning of truck trips on mainline freeways, on freeway on/off-ramps and at freeway ramp intersections.

If you have any questions, you may reach me at (213) 897-6696 and please refer to our record number 090324/CS.

Sincerely,

ELMER ALVAREZ

Re: Comments to Regional Connector Transit Corridor Project

Dear Ms. Roybal Saltarelli,

Thank you for the opportunity to comment on the Scoping Packet for the above referenced project. The California Department of Transportation (Department), Division of Environmental Planning has the following comments for your consideration in the preparing the Environmental Impact Report / Environmental Impact Statement (EIR / EIS) for this project:

1. Considering expanding scoping to discuss the social, economic and environmental impacts of the project. Examine what potential environmental impacts should be evaluated to determine what environmental process, to be followed, and what level of analysis for each impact.

2. Recommend the scoping process address allocated assignments of the project and how the studies will be collected.

3. The affected environment of the project should be studied and address the resource impacts of the study area.

4. Discuss an outline of the possible timing of the study activities.

5. Identify what studies and experts would be need for the project.

If you have any questions regarding these comments, please do not hesitate to contact me or Brian Manor at 213-897-0704.

Sincerely,

Garrett Damrath
Senior Environmental Planner

Re: SCH#2009031043; CEQA Notice of Preparation (NOP); draft Environmental Impact Report (DEIR); for the Regional Connector Transit Corridor Project; Los Angeles County, California

Dear Ms. Roybal Saltarelli:

The Native American Heritage Commission (NAHC) is the state 'trustee agency' pursuant to Public Resources Code §21070 designated to protect California's Native American Cultural Resources. The California Environmental Quality Act (CEQA) requires that any project that causes a substantial adverse change in the significance of an historical resource, that includes archaeological resources, is a 'significant effect' requiring the preparation of an Environmental Impact Report (EIR) per the California Code of Regulations §15064.5(b)(c)(f) CEQA guidelines). Section 15382 of the 2007 CEQA Guidelines defines a significant impact on the environment as "a substantial, or potentially substantial, adverse change in any of physical conditions within an area affected by the proposed project, including ... objects of historic or aesthetic significance." In order to comply with this provision, the lead agency is required to assess whether the project will have an adverse impact on these resources within the 'area of potential effect (APE)', and if so, to mitigate that effect. To adequately assess the project-related impacts on historical resources, the Commission recommends the following action:

√ Contact the appropriate California Historic Resources Information Center (CHRIS) for possible 'recorded sites' in locations where the development will or might occur.. Contact information for the Information Center nearest you is available from the State Office of Historic Preservation (916/653-7278)/ http://www.ohp.parks.ca.gov. The record search will determine:

- If a part or the entire APE has been previously surveyed for cultural resources.
- If any known cultural resources have already been recorded in or adjacent to the APE.
- If the probability is low, moderate, or high that cultural resources are located in the APE.
- If a survey is required to determine whether previously unrecorded cultural resources are present.

√ If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.

- The final report containing site forms, site significance, and mitigation measurers should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum, and not be made available for pubic disclosure.
- The final written report should be submitted within 3 months after work has been completed to the appropriate regional archaeological Information Center.

√ The Native American Heritage Commission (NAHC) performed:

* A Sacred Lands File (SLF) search of the project 'area of potential effect (APE)': The results: No known Native American Cultural Resources were identified within one-half mile of the 'area of potential effect' (APE).: However the NAHC SLF is not exhaustive and local tribal contacts should be consulted from the attached list and the there are Native American cultural resources in close proximity..

- The NAHC advises the use of Native American Monitors, also, when professional archaeologists or the equivalent are employed by project proponents, in order to ensure proper identification and care given cultural resources that may be discovered. The NAHC, FURTHER, recommends that contact be made with Native American Contacts on the attached list to get their input on potential IMPACT of the project (APE) on cultural resources.. In some cases, the existence of a Native American cultural resources may be known only to a local tribe(s) or Native American individuals or elders.
- √ Lack of surface evidence of archeological resources does not preclude their subsurface existence.
- Lead agencies should include in their mitigation plan provisions for the identification and evaluation of accidentally discovered archeological resources, per California Environmental Quality Act (CEQA) §15064.5 (f). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American, with knowledge in cultural resources, should monitor all ground-disturbing activities.
- Again, a culturally-affiliated Native American tribe may be the only source of information about a Sacred Site/Native American cultural resource.

- Lead agencies should include in their mitigation plan provisions for the disposition of recovered artifacts, in consultation with culturally affiliated Native Americans.

√ Lead agencies should include provisions for discovery of Native American human remains or unmarked cemeteries in their mitigation plans.

- CEQA Guidelines, Section 15064.5(d) requires the lead agency to work with the Native Americans identified by this Commission if the initial Study identifies the presence or likely presence of Native American human remains within the APE. CEQA Guidelines provide for agreements with Native American, identified by the NAHC, to assure the appropriate and dignified treatment of Native American human remains and any associated grave liens.

√ Health and Safety Code §7050.5, Public Resources Code §5097.98 and Sec. §15064.5 (d) of the California Code of Regulations (CEQA Guidelines) mandate procedures to be followed, including that construction or excavation be stopped in the event of an accidental discovery of any human remains in a location other than a dedicated cemetery until the county coroner or medical examiner can determine whether the remains are those of a Native American. . Note that §7052 of the Health & Safety Code states that disturbance of Native American cemeteries is a felony.

√ Lead agencies should consider avoidance, as defined in §15370 of the California Code of Regulations (CEQA Guidelines), when significant cultural resources are discovered during the course of project planning and implementation

Please feel free to contact me at (916) 653-6251 if you have any questions.

Sincerely,

Dave Singleton
Program Analyst

RE: Comments on the Scoping of the DEIS/DEIR for the Regional Transit Connector Project

Dear Ms. Roybal-Saltarelli:

We would like to express our appreciation to the Metro staff and consultant team for the extensive outreach efforts that have been made during the environmental scoping phase of this project. In general, we recognize the need and benefit of this transportation improvement project as an important link in the regional public transit system that will make transit use more convenient and faster for passengers, which will further the collective goal of increasing transit ridership across the Greater Los Angeles region, reducing auto dependence and traffic congestion and improving air quality.

Staff from several City of Los Angeles departments, notably City Planning (LADCP), Transportation (LADOT), and Public Works (LADPW), as well as the Community Redevelopment Agency of the City of Los Angeles (CRA/LA), have reviewed the proposed scope and attended the public scoping meetings. Based on their comments along with the vision and goals adopted by the City through various planning documents, including the Central City and Central City North Community Plans, this letter summarizes the primary concerns that we believe should be given particular attention and emphasis in the DEIS and DEIR.

1. **Impact on the Long-Range Plans and Needs of the Entire Regional Transit System**

   Establishing an accurate and appropriate definition for a project has to be an over-arching concern for any environmental documentation. As stated in the Federal Register Notice of Preparation, the purpose of the project is "...to improve the mobility within the corridor by connecting to the light rail service of the Metro Gold Line to Pasadena, the Metro Gold Line Eastside Extension, the Metro Blue Line, and the Metro Expo Line." We very strongly support this intent; however, we believe the Regional Connector is only one good step in developing a regional light rail system that provides for a variety of travel options and improves mobility to and through downtown. We express a desire to work with Metro to discuss the future light rail transit connections and operations to and through downtown Los Angeles to help develop the system that will support the City of Los Angeles.

2. **Impact on Accessibility, Pedestrian Safety, Livability and Economic Vitality in Downtown Los Angeles**

While the DEIS/DEIR should consider both the at-grade and underground alternatives, operating the Regional Connector in a surface configuration would create excessive and unreasonable impacts with respect to obstruction of street (vehicular and pedestrian) traffic, safety and security of both vehicles and pedestrians, noise and vibration on fronting businesses and residents, visual intrusion and blight, as well as significantly diminishing community livability and economic development potentials over what would occur with a below-grade facility design. Thus, we believe that the City of Los Angeles would be more likely to support the construction of a below-grade light rail connector through Downtown that minimizes negative impacts to the community and maximizes the benefits of improved transit access to and from Downtown's increasingly vibrant neighborhood districts. We would expect the DEIS/DEIR to be thorough and diligent in appropriately evaluating the potential effects that construction and operation may have on accessibility, circulation, safety, the built environment, future development and economic growth, community livability and neighborhood identity.

3. **Station Placement and Design Issues to Consider**

The context of the built environment should be carefully considered in the placement and design of each new rail station and portal, and the City's existing land use plans and policies offer insight into the unique character of the communities that will be served by the project. General concepts to consider are listed below.

- Station location, design, and access issues, including consideration of multiple portal locations for each station (especially transfer stations), and the provision of transit amenities such as bicycle storage lockers, showers for bicyclists, public restrooms, taxi stands, Wi-Fi Internet access, and proximity to bus stops.
- Pedestrian accessibility and circulation in the vicinity of station sites, with particular emphasis on the following:
    - Ensuring connectivity between each station and the surrounding neighborhood;
    - Providing wayfinding signage to facilitate access to key destinations;
    - Incorporating pedestrian amenities such as bus shelters, landscaping, awnings or overhangs, and adequate lighting; and
    - Creating an identity and sense of place at each station by incorporating urban design best practices.
- Linkages to the multimodal transit network, including improvements at key transfer points.
- Ecologically sustainable design elements, such as solar panels, energy-efficient lighting, stormwater retention, water recycling, and drought-tolerant landscaping.

CRA/LA
Building communities

- Approaches to system and station design that maximize potential reductions in vehicle miles traveled (VMT) and greenhouse gas emissions.
- Opportunity sites for joint development that would help to integrate this new transportation system into our existing neighborhoods, reinforce the unique character of our vibrant mixed-use districts, and promote active streets that encourage the viability of ground floor retail and services.
- Impacts to historic structures.

We are also interested in collaborating on the refinement of station locations and ensuring that transit-supportive land use policies and surface transportation connectivity work to enhance the overall viability of the project. Though various planning documents, including the Central City and Central City North Community Plans, the City of Los Angeles has developed a set of principles that we believe should guide development of the Regional Connector project, and we request that Metro consider these principles, which are attached as Exhibit A, when studying the potential environmental impacts of the alignment and station options. Specific issues regarding the project's potential below-grade station locations in Downtown Los Angeles are discussed in greater detail in the attached Exhibit B.

The Metro Regional Connector Transit Corridor Project is a major transit investment that has the potential to enhance the viability of the regional transportation system, if not reinforce Downtown Los Angeles as the center of the City and the greater metropolitan area. The project will also help us to achieve mobility and sustainability goals for the region, providing key linkages between regional centers of employment and housing, and facilitating reduced dependence on the automobile. The City Planning Department along with CRA/LA and LADOT is currently engaging the Downtown community in developing a new Central City Community Plan that will reexamine land use policies and development regulations throughout the entire Regional Connector project area. We look forward to collaborating with you on both of these important projects, to better link transportation and land use policies that will promote a livable and sustainable Downtown.

Thank you for the opportunity to share our comments. We look forward to continue working closely with Metro's project team in bringing forth the very best result possible from these efforts.

Sincerely yours,

EXHIBIT A

Principles that Should Guide Development of the Regional Connector Project

- It should be easy to use and have clearly identified points of access (stations, portals, etc).

- It should create opportunities to enhance neighborhood identity by providing urban amenities and incorporating urban design elements that reinforce the public realm and a sense of place.

- It should maximize ridership and strike a balance between the function of moving passengers through Downtown and conveniently getting people to Downtown destinations (as many of the trips will still terminate Downtown).

- The stations should not drive the alignment; the best alignment should be chosen.

- Existing roadways should be maintained for all users: autos, buses, pedestrians, cyclists, etc. Downtown streets should be complete streets, emphasizing a pedestrian priority.

- Downtown neighborhoods should be enhanced and reinforced by this project. The project should improve the sustainability of the district and not negatively affect the livability or economic vitality of Downtown and its distinct neighborhoods.

- Station area priorities are Bunker Hill, Civic Center, Historic Core and Little Tokyo.

- Station stops should be appropriately integrated into the land use and development patterns and street grid of their Downtown neighborhoods. Their design and placements should encourage Transit Oriented Development. Stations should include elements that ensure the safety and comfort of pedestrians and users, including lighting and communications.

- Consideration should be given to how the Regional Connector is going to interact with the proposed Downtown Urban Streetcar (currently proposed to connect South Park to Bunker Hill via Broadway).

- The new Downtown Street Standards should be utilized for the analysis of the traffic impacts of the possible alignments.

- The proposed project alternatives should not interfere with any project entitlements approved by the City or CRA/LA as part of a Development Agreement unless agreed to by the City.

EXHIBIT B

Specific Issues Regarding Existing and Potential Below-Grade Station Locations

- 7th Street/Metro Center (Existing)
  This station is a major transfer point in the Metro Rail system and is situated in the heart of the City's Financial District. Although three station portals exist on the north side of 7th Street, this station should be assessed for potential pedestrian circulation impacts brought by significant new ridership. Consideration should be given to coordinating future development with improved pedestrian access from the south side of 7th Street into an expanded light rail-subway transfer station. Although dominated by commercial office, retail, and visitor-oriented uses, the area around this station has seen a number of new residential units open in recent years, including in the building directly above the station, which provides even greater ridership potential with the provision of additional transit service and better connectivity.

- 4th/5th/Flower (Potential)
  This station would also be located in the heart of the City's Financial Core near the Central Library, and would provide improved access to high-rise office, residential, and hotel uses in the southern portion of the adjacent Bunker Hill district. The high intensity of development in the area is conducive to additional rail transit service, and a number of redevelopment opportunity sites exist in the vicinity that could further enhance the viability of new rail service. Specific attention needs to be paid to potential multiple portal locations to facilitate access to downtown destinations and minimize pedestrian/vehicular conflicts at high volume intersections.

- 2nd/Grand/Hope (Potential)
  This station would be located in Bunker Hill, a major regional destination that would benefit tremendously from improved rail transit access. Ideally, this station should be convenient to serve employment hubs in the vicinity, while also providing direct access to the numerous cultural facilities located at the adjacent Music Center complex. The station and portal locations should also be coordinated with the Grand Avenue Project, a multi-phase mixed-use development with commercial, residential, hotel, and other uses encompassing several city blocks in this area, to maximize ridership potential and reduce the need for excessive automobile parking.

- 2nd/Main/Los Angeles (Potential)
  As currently proposed, this station would be located at the crossroads of the Historic Core, Little Tokyo and Civic Center districts. However, consideration should be given to ensuring connectivity with the Downtown Streetcar at Broadway, which could be achieved with an expanded portal or by locating the station closer to Broadway. Several regional civic and cultural destinations are within close proximity to this location, including City Hall, the new Los Angeles Police Department headquarters, Caltrans District 7 headquarters, the Little Tokyo Branch Library, and the Los Angeles Times. There are also key underdeveloped sites along 2nd Street and on Broadway, Spring, and Main Streets that have the potential for new commercial and residential uses that would promote and link with a new rail portal. Appropriate integration of this station and the existing Civic Center Station serving the Red and Purple Lines should also be explored.

- Little Tokyo/Arts District (Under Construction)
  The soon-to-open Little Tokyo/Arts District station at 1st and Alameda Streets is surrounded by a vibrant mixture of residential, commercial, and industrial uses that will benefit from increased regional transit access. Although somewhat smaller in scale than other Downtown districts, Little Tokyo and the Arts District contain significant regional destinations such as the Japanese American National Museum and the Geffen Contemporary at the Museum of Contemporary Art (MOCA). Recent and future mixed-use development will support the local culture and heritage of these dynamic neighborhoods and create demand for additional transit service in the surrounding area.

  The current alignment for the Underground Emphasis alternative indicates the Regional Connector would have an at-grade crossing at 1st and Alameda Streets, with a new underpass for auto and truck traffic along Alameda as well as a new overhead pedestrian bridge structure. This proposed alignment and the configuration of the intersection would have particular concerns that need to be addressed in the DEIS/DEIR, including the following:

  Realizing Alameda as a "Complete Street"
  Alameda Street today is an intensively-used but badly neglected corridor that is serving increasing and increasingly diverse needs. While it will continue to be a vital arterial for industrial truck traffic, Alameda Street also now needs to become more supportive of evolving commercial, mixed-use and residential development occurring in and near Little Tokyo and the adjacent Arts District. To that end, Alameda Street needs not only to be fully rehabilitated, but it also needs to be reconfigured to better relate to adjoining development, vehicular access and pedestrian circulation. A design for how Alameda Street is to evolve has not yet been devised; however, it is essential that the Regional Connector's facilities fully respect this need and preserve the street's options for development.

  While it is essential to grade-separate the Regional Connector from Alameda Street's local and through traffic demands, the proposed underpass and its approaches will create a lot of barriers and broken connections in this area of Little Tokyo and the Arts District. Also, concrete retaining walls and bridge structures are likely to magnify the noise impacts from truck traffic on nearby residential blocks. A specific program of design mitigations should be identified to address these impacts if an alternate design is not to be pursued.

  Maintaining 1st Street Pedestrian Safety, Community Livability and Attractive Connections to the Little Tokyo/Arts District Station
  Pedestrian overpass connections are difficult to design well. The DEIS/DEIR should include: design requirements that mitigate compromising aspects, including excessive shade, shadow and massing; excessive loss of sightlines and orientation to the Little Tokyo/Arts District Station; diminishment of the pedestrian orientation around the Japanese American National Museum; potential user difficulties or discomfort in climbing stairs or ramps; potential user discomfort from excessively exposed or vulnerable walkway segments.

Please consider in your analysis the environmental impacts of maintaining the underground alignment with the light rail tunnel emerging after crossing under 1st Street up to a second parallel platform at the Little Tokyo/Arts District Station, as well as creating a short underground alignment going east (parallel to existing tracks) with a tunnel emerging prior to reaching the 1st Street Bridge, possibly at Garey or Vignes Streets. This would eliminate all additional transportation conflicts at the intersection of 1st and Alameda. This intersection is increasingly important because it links the Downtown area with the Eastside and the 6th Street Viaduct project will impact other intersections affecting east-west thoroughfares from Downtown to the Eastside once construction is underway

Los Angeles, CA 90012

Re: Notice of Preparation for a draft EIR fro proposed Regional Connector Transit Corridor

Dear Ms. Saltarelli:

Thank you for providing us with a copy of your Notice of Preparation (NOP) for the Regional Connector Transit Corridor Draft Environmental Report. The California Public utilities Commission (CPUC or Commission) appreciates the opportunity to provide the following comments.

One of the proposed design alternatives involves an at-grade emphasized LRT alignment that would extend from the underground 7th/Metro Center Station. The alignment would rise above ground twice; once just north of 5th St to cross 3rd St at-grade, and again between Olive St and Hill St, along 2nd St. into a couplet configuration on Main St. and Los Angeles Ave. to Temple Blvd. This surface street alignment will create several at-grade rail crossings and expose the public to potential pedestrian-train and automobile-train conflicts. The Commission has adopted the Federal Railroad Administrations policy on reducing the number of at-grade crossings, and accordingly does not approve the construction of new at-grade crossings unless the applicant can provide substantial evidence that a grade separation is not practicable.

Other design scenarios include an underground emphasized LRT alignment with one single at-grade crossing at the intersection of 1st and Alameda Streets. Commission staff has concerns over the proposed at-grade crossing of 1st St and recommends grade separating the entire intersection of 1st and Alameda St. due to the high number vehicles and trains that would traverse the proposed Regional Connector at-grade crossing.

RCES favors the underground alternative over the street surface alternative, and ask for LACMTA to arrange additional meetings with the Commission's Rail Crossings Engineering Section to discuss relevant safety issues and to conduct a diagnostic review at the proposed crossing location.

Commission approval is required for construction of new at-grade crossings. RCES staff also requests that LACMTA provide RCES with a copy of relevant traffic impact studies for the intersections that will be impacted by construction of the Regional Connector.

We understand that this is a highly complex and challenging project with funding, design and environmental approval for the downtown Los Angeles area. It is imperative that the CPUC be involved with the details of this project from its inception in order to be informed and to be of greater assistance in the future.

The CPUC will need to provide applicable regulatory oversight for all phases of the project. This will require early consultation with not only LACMTA staff but contracted consultants as well in order to provide early consultation on all proposed design and engineering of the proposed project improvements on the corridor.

This will assist with the review of the environmental documents and final CEQA approval of the project by the CPUC, since we are a responsible agency under CEQA section 15381 with regard to this project and in complying with any and all General Order requirements as they apply to the Regional Connector project.

Thank you very much for the opportunity to review and comment on your NOP. Commission staff is available to meet with you and discuss our concerns.

If you have any questions, please contact me at (213) 576-7085 or sal@cpuc.ca.gov

Sincerely,

Sergio Licon

Dolores Roybal Saltarelli, AICP, Project Manager
Los Angeles County Metropolitan Transportation Authority
One Gateway Plaza
Los Angeles, California 90012

Dear Ms. Saltarelli:

This is in response to your request for comments on the Invitation to Participate in the Environmental Review Process for the Regional Connector Transit Corridor Project in the City and County of Los Angeles, California.

Please review the current effective countywide Flood Insurance Rate Maps (FIRMs) for the City (Community Number 060137) and County (Community Number 065043) of Los Angeles, Maps revised September 26, 2008. Please note that the City and County of Los Angeles, California are participants in the National Flood Insurance Program (NFIP). The minimum, basic NFIP floodplain management building requirements are described in Vol. 44 Code of Federal Regulations (44 CFR), Sections 59 through 65.

A summary of these NFIP floodplain management building requirements are as follows:

- All buildings constructed within a riverine floodplain, (i.e., Flood Zones A, AO, AH, AE, and A1 through A30 as delineated on the FIRM), must be elevated so that the lowest floor is at or above the Base Flood Elevation level in accordance with the effective Flood Insurance Rate Map.

- If the area of construction is located within a Regulatory Floodway as delineated on the FIRM, any ***development*** must not increase base flood elevation levels. **The term *development* means any man-made change to improved or unimproved real estate, including but not limited to buildings, other structures, mining, dredging, filling, grading, paving, excavation or drilling operations, and storage of equipment or materials.** A hydrologic and hydraulic analysis must be performed *prior* to the start of development, and must demonstrate that the development would not cause any rise in base flood levels. No rise is permitted within regulatory floodways.

- All buildings constructed within a coastal high hazard area, (any of the "V" Flood Zones as delineated on the FIRM), must be elevated on pilings and columns, so that the lowest horizontal structural member, (excluding the pilings and columns), is elevated to or above the base flood elevation level. In addition, the posts and pilings foundation and the structure attached thereto, is anchored to resist flotation, collapse and lateral movement due to the effects of wind and water loads acting simultaneously on all building components.

- Upon completion of any development that changes existing Special Flood Hazard Areas, the NFIP directs all participating communities to submit the appropriate hydrologic and hydraulic data to FEMA for a FIRM revision. In accordance with 44 CFR, Section 65.3, as soon as practicable, but not later than six months after such data becomes available, a community shall notify FEMA of the changes by submitting technical data for a flood map revision. To obtain copies of FEMA's Flood Map Revision Application Packages, please refer to the FEMA website at http://www.fema.gov/business/nfip/forms.shtm.

Please Note:

Many NFIP participating communities have adopted floodplain management building requirements which are more restrictive than the minimum federal standards described in 44 CFR. Please contact the local community's floodplain manager for more information on local floodplain management building requirements. The City of Los Angeles floodplain manager can be reached by calling Mark Pestrella, Assistant Deputy Director, Department of Public Works, at (626) 458-5100. The Los Angeles County floodplain manager can be reached by calling George De La O, Senior Civil Engineer, at (626) 458-7155.

If you have any questions or concerns, please do not hesitate to call Cynthia McKenzie of the Mitigation staff at (510) 627-7190.

Sincerely,

Gregor Blackburn, CFM, Branch Chief
Floodplain Management and Insurance Branch

Subject: Scoping Comments for the Regional Connector Transit Corridor Project, Los Angeles County Metropolitan Transportation Authority (LACMTA), Los Angeles, California

Dear Mr.Tellis:

The U.S. Environmental Protection Agency (EPA) has reviewed the Notice of Intent published in the Federal Register March 24, 2009, by the Federal Transit Administration (FTA) to prepare a Draft Environmental Impact Statement (DEIS) for the Regional Connector Transit Corridor, a proposal to provide a direct transit connection between the Metro Gold Line to Pasadena, the Metro Gold Line to East Los Angeles, the Metro Blue Line, and the Metro Expo Line. Our comments are provided pursuant to the National Environmental Policy Act (NEPA), the Council on Environmental Quality's (CEQ) regulations (40 CFR 1500-1508) and Section 309 of the Clean Air Act.

EPA appreciates the opportunity to provide comments for the preparation of the DEIS for the Regional Connector Transit Corridor Project. We are supportive of this project as it has the potential to increase transit mode share and reduce air quality impacts from auto emissions in Los Angeles County, as well as provide time savings for existing transit riders. Our concerns, as described below, focus on how the DEIS will address impacts to (1) air quality, (2) integration with existing facilities, and (3) environmental justice communities and public involvement.

Air Quality

The proposed Regional Connector Transit Corridor Project is located in the South Coast Air Basin, which is classified as non-attainment for ozone and particulate matter (PM_{10} and $PM_{2.5}$), and should therefore be included in a current conforming transportation plan and transportation improvement program. In addition, while the project has the potential to reduce air quality impacts by providing additional transit service that could reduce automobile use, implementation of the project may result in impacts to air quality resulting from changes to traffic operations, parking, and local

Printed on Recycled Paper

circulation. The DEIS should include a through analysis of these potential air quality impacts and identify opportunities to reduce emissions. The TSM alternative (rail station connectivity achieved via shuttle buses) should identify opportunities to reduce unnecessary idling, improved emission control device installation, and replacement of older buses, or purchase of new vehicles with low-emission diesel technology or alternative fuels.

The DEIS should also address potential air quality impacts during the construction period. EPA recommends that the following mitigation measures be included in the DEIS to reduce construction emissions:

Fugitive Dust Source Controls:

- Stabilize open storage piles and disturbed areas by covering and/or applying water or chemical/organic dust palliative where appropriate. This applies to both inactive and active sites, during workdays, weekends, holidays, and windy conditions.
- Install wind fencing and phase grading operations where appropriate, and operate water trucks for stabilization of surfaces under windy conditions.
- When hauling material and operating non-earthmoving equipment, prevent spillage and limit speeds to 15 miles per hour (mph). Limit speed of earth-moving equipment to 10 mph.

Mobile and Stationary Source Controls:

- Reduce use, trips, and unnecessary idling from heavy equipment.
- Maintain and tune engines per manufacturer's specifications to perform at EPA certification, where applicable, levels and to perform at verified standards applicable to retrofit technologies. Employ periodic, unscheduled inspections to limit unnecessary idling and to ensure that construction equipment is properly maintained, tuned, and modified consistent with established specifications. The California Air Resources Board has a number of mobile source anti-idling requirements which could be employed. See their website at: http://www.arb.ca.gov/msprog/truck-idling/truck-idling.htm
- Prohibit any tampering with engines and require continuing adherence to manufacturer's recommendations.
- If practicable, lease new, clean equipment meeting the most stringent of applicable Federal or State Standards. In general, use equipment meeting Tier 3 or greater engine standards and commit to the best available emissions control technology. Tier 3 engine standards are currently available; for some equipment Tier 4 is available for the 2009-model year and should be used for project construction equipment to the maximum extent feasible. Lacking availability of non-road construction equipment that meets Tier 3 or greater engine standards, commit to using the best available emissions control technologies on all equipment.

- Utilize EPA-registered particulate traps and other appropriate controls where suitable to reduce emissions of particulate matter and other pollutants at the construction site.

Administrative controls:

- Identify all commitments to reduce construction emissions and update the air quality analysis to reflect additional air quality improvements that would result from adopting specific air quality measures.
- Identify where implementation of mitigation measures is rejected based on economic infeasibility.
- Prepare an inventory of all equipment prior to construction and identify the suitability of add-on emission controls for each piece of equipment before groundbreaking. (Suitability of control devices is based on: whether there is reduced normal availability of the construction equipment due to increased downtime and/or power output, whether there may be significant damage caused to the construction equipment engine, or whether there may be a significant risk to nearby workers or the public.) Meet EPA diesel fuel requirements for off-road and on-highway, and where appropriate use alternative fuels such as natural gas and electric.
- Develop a construction traffic and parking management plan that minimizes traffic interference and maintains traffic flow.
- Identify sensitive receptors in the project area, such as children, elderly, and infirm, and specify the means by which you will minimize impacts to these populations. For example, locate construction equipment and staging zones away from sensitive receptors and fresh air intakes to buildings and air conditioners.

Integration with Existing Facilities

The DEIS should explore the extent to which proposed alternatives will integrate with existing transportation facilities. The document should discuss how the project will impact existing vehicle lanes, bicycle lanes and pedestrian paths due to project construction or operation. While the *At-Grade Emphasis LRT Alternative* and *Underground Emphasis LRT Alternative* are intended to provide a seamless connection between LACMTA light rail lines, all potential alternatives should identify the opportunities available to better connect all modes of transportation, including heavy rail, light rail, bus rapid transit, standard bus service, and pedestrian facilities. Measures to minimize or mitigate impacts to vehicle lanes, bicycle lanes, and pedestrian paths should be addressed in the DEIS.

Environmental Justice and Community Involvement

The DEIS should identify how the proposed alternatives may affect the mobility of low income or minority populations in the surrounding areas and provide appropriate mitigation measures for any anticipated adverse impacts. Executive Order 12898

addresses Environmental Justice in minority and low-income populations, and the Council on Environmental Quality has developed guidance concerning how to address Environmental Justice in the environmental review process (http://ceq.eh.doe.gov/nepa/regs/ej/justice.pdf). Future environmental justice analyses for this project and the DEIS should include a description of the area of potential impact used for the analysis and provide the source of the demographic information. The DEIS should identify whether the proposed alternatives may disproportionately and adversely affect low-income or minority populations in the surrounding area and should provide appropriate mitigation measures for any adverse impacts.

Community involvement activities for the Regional Connector Transit Corridor project should include opportunities for incorporating public input to promote context sensitive design, especially in Environmental Justice communities.

We appreciate the opportunity to provide comments on the preparation of the DEIS, and look forward to continued participation in this process as more information becomes available. When the DEIS is released for public review, please send two copies to the address above (mail code CED-2). If you have any questions, please contact me at 415-947-3554 or mulvihill.carolyn@epa.gov.

Sincerely,

Carolyn Mulvihill

1.0 SUMMARY

This technical memorandum summarizes the potential cumulative impacts that could result from the Regional Connector Transit Corridor project in combination with the identified past, present, and reasonably foreseeable projects considered. Cumulative impacts are analyzed in more detail in each of the technical memoranda prepared for each resource area. For more information about potential cumulative impacts please see the resource specific technical memoranda. The alternatives analyzed include the No Build Alternative, the Transportation System Management (TSM) Alternative, the At-Grade Emphasis Light Rail Transit (LRT) Alternative, the Underground Emphasis LRT Alternative, the Fully Underground LRT Alternative –Little Tokyo Variation 1, and the Fully Underground LRT Alternative –Little Tokyo Variation 2.

The No Build Alternative would not involve any construction and, therefore, would not result in any cumulative impacts, with the exception of transit systems and environmental justice impacts. Cumulative transit impacts associated with the No Build Alternative would be adverse as this alternative would not close the gap in the rail transit system and would not provide the travel time and convenience benefits for transit users associated with the build alternatives. This adverse transit impact would disproportionately affect transit-dependent users who also tend to be environmental justice populations based on income and other factors. For these transit patrons that have no other travel options, travel times would increase and transit usage would be less convenient resulting in a cumulative adverse environmental justice impact from the No Build Alternative. There would be a negative transit impact upon those that rely on the public transit system, for east-west and north-south travel through the downtown area. This would result in an adverse cumulative transit impact. The No Build Alternative would result in cumulative disproportionate adverse impacts related to transit service equity.

With implementation of mitigation, the TSM Alternative would not contribute to any cumulative impacts, with the exception of transit systems and environmental justice. Cumulative transit impacts associated with the TSM Alternative would be adverse as this alternative would not close the gap in the rail transit system and would not provide the travel time and convenience benefits for transit users associated with the build alternatives. This adverse transit impact would disproportionately affect transit-dependent users who tend to be environmental justice populations based on income and other factors. For these transit patrons that have no other travel options, travel times would increase and transit usage would be less convenient resulting in a cumulative adverse environmental justice impact from the TSM Alternative. There would be a negative transit impact upon those that rely on the public transit system, for east-west and north-south travel through the downtown area. This would result in an adverse cumulative transit impact. The TSM Alternative would result in cumulative disproportionate adverse impacts related to transit service equity.

Even with implementation of possible mitigation measures, construction of the At-Grade Emphasis LRT Alternative could result in a considerable contribution to cumulative construction impacts associated with bus transit, traffic circulation, and pedestrian and bicycle movements. Construction and operation of the At-Grade Emphasis LRT Alternative would result in a considerable contribution to adverse cumulative impacts at 11 intersections during the AM peak hour and 15 intersections during the PM peak hour. With regards to permanent displacements, operation of the At-Grade Emphasis LRT Alternative would partially offset potential impacts due to loss of parking.

Although regional construction emissions under the At-Grade Emphasis LRT Alternative would be significant and unavoidable, operation of the alternative would reduce regional vehicle miles traveled (VMT), which would result in a beneficial impact to air quality and outweigh the temporary construction impacts. Cumulative impacts to all other environmental resources would be less than significant.

With incorporation of possible mitigation measures, construction of the Underground Emphasis LRT Alternative could still result in a considerable contribution to cumulative construction impacts associated with bus transit, traffic circulation, and pedestrian and bicycle movements. Implementation of the Underground Emphasis LRT Alternative would result in a considerable contribution to significant cumulative impacts at two intersections (Alameda Street/2nd Street and Flower Street/4th Street) during the AM peak hour and three intersections (Judge John Aiso Street/1st Street; Alameda Street/2nd Street; and Judge John Aiso Street/Temple Street) during the PM peak hour. With regard to permanent displacements, operation of the Underground Emphasis LRT Alternative would partially offset potential impacts due to loss of parking.

Although regional construction emissions under the Underground Emphasis LRT Alternative would be significant and unavoidable, operation of the alternative would reduce regional VMT, which would result in a beneficial impact to air quality and outweigh the temporary construction impacts. Cumulative impacts to all other environmental resources would be less than significant.

The Fully Underground LRT Alternative – Little Tokyo Variation 1 and the Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in similar cumulative impacts. With incorporation of possible mitigation measures, construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 and the Fully Underground LRT Alternative – Little Tokyo Variation 2 could still result in a considerable contribution to cumulative construction impacts associated with bus transit, traffic circulation, and pedestrian and bicycle movements. Implementation of either of these alternatives would result in a cumulatively considerable impact at one intersection (Flower Street/ 4th Street) during the AM peak hour.

Although regional construction emissions under the Fully Underground LRT Alternative – Little Tokyo Variation 1 and the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be significant and unavoidable, operation of the either alternative would reduce regional VMT, which would result in a beneficial impact to air quality and outweigh the temporary significant construction impacts. The Fully Underground LRT Alternative – Little Tokyo Variation 1 and the Fully Underground LRT Alternative – Little Tokyo Variation 2 would not contribute to cumulative impacts with respect to all other environmental resources.

2.0 INTRODUCTION

This technical memorandum summarizes potential cumulative impacts that could result from the Regional Connector Transit Corridor project in combination with identified past, present, and reasonably foreseeable projects. Please see the resource specific technical memoranda for a more detailed analysis of cumulative impacts for each resource.

The National Environmental Policy Act (NEPA) provides for consideration of three types or categories of effect: direct, indirect, and cumulative (40 C.F.R. §1508.25). Direct effects are those caused directly by the project activities. Indirect effects are caused by project activities that occur later in time, at some distance from the project, and are in the chain of cause-and-effect relationships.

According to Section 15130 of the California Environmental Quality Act (CEQA) Guidelines, an environmental impact report (EIR) shall discuss cumulative impacts of a project when the project's incremental effect is cumulatively considerable. If a project's incremental effect is not cumulatively considerable, the effect is not considered significant.

"Cumulative impacts" refer to two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts. Cumulative effects include both direct and indirect effects in combination with the past and reasonably foreseeable future actions of other projects and entities. The cumulative impact is the change in the environment which results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable projects. Cumulative impacts can result from individually minor, but collectively significant actions taking place over a period of time, regardless of the agency or person undertaking the project.

If there are no direct or indirect effects on a particular resource, then there cannot be any cumulative effects on that resource from the project and that discipline will not be discussed further. Where an alternative results in a considerable contribution to a cumulative impact, mitigation measures have been identified to reduce the project's contribution to the cumulative impact.

3.0 METHODOLOGY FOR IMPACT EVALUATION

3.1 NEPA Guidance

An analysis of cumulative impacts is required by NEPA, as defined in 40 Code of Federal Regulations (CFR) 1508.7. The NEPA analysis of cumulative impacts follows the guidance of the Council of Environmental Quality's (CEQ) 1997 document, *Considering Cumulative Effects Under the National Environmental Policy Act.* In accordance with this guidance, the significance of impacts is evaluated based on context and intensity. Considerations of context and intensity also include a discussion of the severity of the impacts and the likelihood of their occurrence.

The standards of significance for cumulative impacts depend on "the type of resource being analyzed, the condition of the resource, and the importance of the resource as an issue (as identified through scoping)" (CEQ 1997, p.45). Therefore, the standards of significance used for cumulative impacts are discipline-specific and may follow the same standards of significance established for the direct and indirect impacts of the project on each resource area. For some resources, limited details about other projects may prevent analysis from reaching the level of precision implied in the standards of significance for the direct and indirect impacts.

3.2 CEQA Guidance

In accordance with CEQA, a significant adverse cumulative impact would occur if an alternative would have environmental effects that are individually limited, but cumulatively considerable. "Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects or expected growth.

The standards for "significant" or "cumulatively considerable" are based on the established significance thresholds for each resource area. However, as noted with regard to NEPA, the analysis level achievable for the cumulative impact evaluation may not provide sufficient detail for comparison to the exact standards of significance used for the project alone. The *Los Angeles CEQA Thresholds Guide* provides some guidance for the cumulative analysis for some resource areas, but does not contain specific standards of significance for each resource area with regard to cumulative impacts.

Determining whether a cumulative impact is "considerable" should also consider the effect of mitigation measures in reducing the effect on a resource. Compliance with previously approved plans or mitigation programs may also be a guide to determining that an effect is not significant. Depending on the discipline area, demonstrating that the project is included in a regional plan or projection may be a measure of whether the project is contributing

cumulative effects. Regional plans developed by the Southern California Association of Governments (SCAG) such as the Regional Transportation Plan (RTP), the Regional Comprehensive Plan and Guide (RCPG), or the Regional Transportation Improvement Program (RTIP)may provide appropriate thresholds or mitigation measures for particular project-related effects.

3.3 Area of Potential Impact

The cumulative context includes the geographic area, timeframe, and/or type of projects that would contribute to the potential cumulative effect. This context differs for each discipline. Each discipline identifies a relevant geographic area for evaluation for direct, indirect, and cumulative impacts. The geographic range considered for the cumulative analysis can vary based on the resource area.

For example, the geographic range over which air quality impacts would occur would not necessarily be the same as the geographic range considered for traffic impacts. In addition, for some disciplines the scope of analysis for cumulative impacts is based on a list of reasonably foreseeable related projects while for others it is be based on general trends in demographics or other regional forecasts. The methodology section in the technical memorandum for each resource area describes the basis for analysis of direct, indirect and cumulative impacts.

3.4 Methodology

The cumulative impacts analysis considered long-term effects of the project; those impacts which may not be apparent in the near-term, but which may evolve into beneficial or adverse impacts in the long-term. Specifically, the cumulative analysis for each resource area considered impacts related to general growth projected for the area. The regional plans for transportation and land use were consulted for the planned future conditions.

According to CEQA Guidelines, the discussion of cumulative impacts should reflect the severity of the impacts, as well as the likelihood of their occurrence. However, the evaluation need not be as detailed as the discussion of environmental impacts attributable to the proposed project alone. Additionally, the discussion should be guided by the standards of practicality and reasonableness.

Beneficial impacts are also considered in this analysis of cumulative impacts. Beneficial impacts could be associated with increased ridership and expanded transit service resulting from implementation of the proposed project in the context of reasonably foreseeable projects and conditions.

There are several steps involved in analyzing cumulative impacts. The initial steps involve analyzing direct and indirect effects, followed by the application of those results to cumulative

effects. These steps, which were followed in the technical memorandum for each resource, are generally outlined below:

- Establish the geographic scope for the analysis. The geographic scope is unique to each discipline and used to analyze project-level and cumulative impacts (documented in the technical memorandum for each resource as part of the methodology for analyzing impacts).
- Establish the time frame for the analysis; important project time frames are defined in Section 3.4.1.
- Characterize the thresholds of significance that are relevant to the resources, ecosystems, and communities of concern. The significance thresholds used to analyze project-level and cumulative impacts are documented in the technical memorandum for each resource as part of the methodology for analyzing impacts for each discipline.
- Identify the effects associated with the proposed action (done as part of the analysis of direct and indirect impacts in the technical memorandum for each resource). If there are no direct or indirect effects of the project on a resource or discipline area then there cannot be any cumulative impacts.
- Identify other actions affecting the resources, ecosystems, and communities of concern. Past, present, and future reasonably foreseeable related projects assumed for the Regional Connector Transit Corridor project cumulative impacts analysis are identified in Section 4.0.
- Define the baseline existing conditions for the resources, ecosystems, and communities. This step is documented in the technical memorandum for each resource as part of the affected environment section and in the description of the No Build Alternative baseline year, 2035 condition.
- Identify the important cause and effect relationships between human activities and resources, ecosystems, and communities. This step is documented in the technical memorandum for each resource as part of the potential effects of each alternative.
- Determine the magnitude and significance of cumulative effects. Significance determinations are related back to the background laid in the methodology section and the thresholds of significance that are relevant to each resource.
- Identify potential mitigation measures for potential effects on each environmental resource. Potential mitigation measures could include measures that would avoid, minimize, or mitigate cumulative impacts as well as direct and indirect impacts.

3.4.1 Project Time Frames

Construction Period: 2014 -2019

The construction period is assumed to extend from 2014 to 2019. A worst-case (i.e. maximum potential impact) scenario is assumed for each discipline. For example, it is assumed that all other related projects for which there is no current construction schedule will be under construction during the project construction period.

Year of Opening: 2019

During 2019, any potential effects from operation of the system would begin to be seen. The planning horizon for the project is 2035.

Project Baseline Year: 2035

The future year 2035 is the baseline year for assumptions regarding the No Build alternative.

4.0 AFFECTED ENVIRONMENT

4.1 Current and Reasonably Foreseeable Related Actions

There are two ways to address the question of what is reasonably foreseeable within the project area. The first is to evaluate the project effects in combination with expected trends in population, employment, land use, and transportation. The second method is to generally review a list of projected projects within the project area that are expected to be under construction or in operation during the same time frames as the proposed project. The most appropriate method may vary by discipline.

Forecasts for elements such as population, employment, land use, air quality, and transportation from regional plans were used in the analysis. Regional plans prepared by SCAG and general plans prepared by the City and County of Los Angeles and other nearby cities provided information on trends and forecasts relevant to the impact analysis for specific disciplines.

The following tables identify projects within the general project area that are either anticipated to be completed prior to start of construction in 2014 or which may be under construction during this project's proposed construction period of 2014 to 2019. There are several subcategories identified, including major renovations, new construction, transportation, and utility projects. The locations of the new construction projects are also indentified in Figures 4-1 through 4-3.

The project lists were developed from information available from the Los Angeles Downtown Center Business Improvement District (DCBID) fourth quarter 2008 project database and the utility district capital improvement plans (CIP). The Community Redevelopment Agency of Los Angeles (CRA) also maintains lists of potential projects. However, it would appear that the projects listed in the DCBID database better meet the definition of "reasonably foreseeable". Many of these potential projects are only in the conceptual planning stages and the timing of construction or operations are unknown. Projects with no reported completion date have been compiled in the tables of projects assumed to be under construction or completed between 2014 and 2019 as a worst-case scenario.

4.1.1 Projects Anticipated to be Completed Prior to 2014

Many of the projects identified in Tables 4-1 and 4-2 are currently under construction and have identified completion dates prior to 2014. These lists may also include some projects which have recently been completed. The locations of related projects are illustrated in Figure 4-1.

Table 4-1. Major Renovation Projects Anticipated to be Completed Prior to 2014[a]					
Number	Project Name	Address[a]	Land Use	Units	Completion
CR1	Rowan Building Lofts	460 S. Spring Street	Residential	206	2009 Q4
CR2	Great Republic Lofts	756 S. Spring Street	Residential	72	2009 Q1
CR3	Metropolitan Lofts	315 W. 5th Street	Residential	84	2009 Q1
CR4	SB Spring	650 S. Spring Street/111 W. 7th Street	Residential	195	2009 Q1
CR5	El Dorado	416 S. Spring Street	Residential	65	2009 Q4
CR6	SB Tower	600 S. Spring Street	Residential	250	2009 Q2
CR7	Rosslyn Lofts	116 W. 5th Street	Residential	297	2009 Q4
CR8	308 E. Ninth St.	308 E. 9th Street	Residential	38	2009 Q1
CR9	Broadway Exchange Building	219 W. 7th Street/660 Broadway	Residential	68	2009 Q1
CR10	Factory Place Arts Complex	1330 Factory Place	Residential	63	2009 Q1

CR12	Barn Lofts	940 E. 2nd Street	Residential	39	2009 Q3

[a] *All projects are located within the City of Los Angeles.*

Transportation

The following transportation capital improvements within the project area are currently identified as funded under Metro's 2009 Long Range Transportation Plan and SCAG's 2008 RTIP. The projects listed in this section are anticipated to be completed prior to 2014 and are shown in Figure 4-2.

- Metro Gold Line to East Los Angeles: This 6-mile light rail extension of the Metro Gold Line from its current southern terminus at Union Station eastward to East Los Angeles opened in 2009. From Union Station, the tracks cross over the Santa Ana Freeway (US 101) and veer west toward Alameda Street. The tracks then follow along the east side of Alameda Street and come down to grade at the intersection of Temple and Alameda Streets. After crossing Temple Street at-grade, the tracks reach the Little Tokyo/Arts District Station on the northeast corner of 1st and Alameda Streets. The tracks then turn eastward on 1st Street and continue to East Los Angeles. With this extension, the Metro Gold Line will provide service from East Los Angeles to Pasadena.

- Eastside Four Quadrant Gate Project: This project, sponsored by Metro, would install rail crossing gates at at-grade intersections located along the portion of the Metro Gold Line to East Los Angeles. This project would include some intersections located along Alameda and 1st Streets in Little Tokyo.

- Metro Expo Line: This 9-mile light rail line will extend from the 7th Street/Metro Center Station to Culver City and is expected to be open in 2010. It will share the boarding platforms at the 7th Street/Metro Center and Pico Stations and the tracks between 7th Street/Metro Center Station and the intersection of Flower Street and Washington Boulevard with the Metro Blue Line.

In addition to the projects listed above, the Metro Gold Line from Pasadena to Azusa and the Metro Expo Line from Culver City to Santa Monica are expected to be completed prior to 2014. These projects are outside of the project area and may only present potential cumulative impacts for operational considerations in a few disciplines. Some cumulative impacts may be beneficial depending upon the alternative.

Utility Projects

The City of Los Angeles maintains an extensive project list of public works projects. One utility project has been identified for construction prior to year 2014. This related project involves the development of District Cooling System proposed by the City of Los Angeles, Department of Water and Power. The District Cooling System would provide air conditioning to office buildings in downtown. The project involves a cooling plant, which would be constructed near 1st Street and Beaudry Avenue with distribution lines located in 1st Street from the cooling plant to San Pedro Street. The projected buildout year for this related project is 2014. Given that the project involves operation of a district cooling system with trunk lines in 1st Street, it is unlikely that it would change the existing baseline conditions. No other projects are planned before 2014 within the project area that would change the existing baseline conditions. Most of the planned projects within the City are related to ongoing maintenance or replacement in-kind of existing infrastructure.

Table 4-2. New Construction Projects Anticipated to be Complete Prior to 2014					
Number	Project Name	Address[a]	Land Use	Units	Completion
CC1	717 Ninth	845 S. Flower Street	Residential	214	2009 Q3
CC2	The Medallion	334 S. Main Street	Mixed Use	200	2009 Q4
CC3	Concerto	900 Figueroa Street	Mixed Use	629	2009 Q3
CC4	Sakura Crossing	235 S. San Pedro Street	Mixed Use	230	2009 Q2
CC5	Hewitt-First Lofts	120-130 S. Hewitt Street	Residential	33	2009 Q3
CC6	LA Live	777 W. Chick Hearn Court	Mixed Use	224	2010 Q1
CC7	The Orsini (Phase III)	867 W. Cesar E Chavez Avenue	Residential	210	2010 Q3
CC8	Alameda and Fourth Condos	4th & Alameda Street	Residential	52	2011 Q1
CC9	Hanjin Group	7th and Figueroa	Mixed Use	unknown	2014

4.1.2 Projects Potentially Under Construction 2014 to 2019

Tables 4-3, 4-4, and 4-5 show projects which are currently in some stage of conceptual planning, but which do not have a defined schedule. Given the uncertainties of project development compounded by the current economic conditions, the probability that these projects will occur is unknown. It may be reasonable to assume that this compilation of projects represents a worst case condition for the construction period. The locations of these related projects are shown in Figure 4-3.

Table 4-3. Institutional and Public Facility Projects Expected to be Completed by 2014[a]			
Number	**Project Name**	**Address[a]**	**Land Use**
CC10	Police Headquarters Building	1st Street between Main and Spring	Institution
CC11	Police Headquarters Vehicle Maintenance Facility	Main Street between 2nd and 3rd Streets	Institution
CC12	Metropolitan Detention Center	Temple & Los Angeles Street	Institution

Major Renovations

Projects located within the project area that propose to convert offices to residential housing and/or which involve a major renovation of an existing structure include:

Table 4-4: Major Renovation Projects Potentially Under Construction 2014-2019[a]

Number	Project Name	Street Address[a]	Land Use	Units
R1	Chester Williams Building	5th Street & Broadway	Residential	82
R2	Cosavings Building	315 W. 9th Street	Residential	98

Transportation

The following transportation capital improvements within the project area are currently identified as funded under Metro's 2009 Long Range Transportation Plan and the Southern California Association of Governments' (SCAG) 2008 Regional Transportation Improvement Program. In addition to the projects listed below, the Metro Crenshaw Line and the Metro Purple Line from Wilshire/Western to Westwood will be under construction, although they are located well outside of the project area and are not likely to present construction-related cumulative impacts.

- Congestion Reduction Demonstration Program: This program will convert existing high-occupancy vehicle (HOV or carpool) lanes to high-occupancy toll (HOT) lanes, where solo drivers could pay a toll to use the lanes. Several stretches of Los Angeles County freeway HOV lanes have been identified for this pilot program, including the El Monte Busway, which runs parallel to the Santa Ana (US 101) and San Bernardino (I-10) Freeways from Alameda Street to El Monte.

- SR 110 Auxiliary Lanes: This project would reconfigure ramp structures and construct northbound and southbound auxiliary lanes on the Harbor Freeway (SR 110) between 8th Street and the Santa Monica Freeway (I-10).

- Angels Flight Railway Rehabilitation: This project would involve an easement between Hill and Olive Streets and 3rd and 4th Streets for the construction of a new propulsion system. The rehabilitation will allow for service along the currently inactive rail line to be restored. The Angels Flight is a short funicular railway that travels the length of one city block up the side of Bunker Hill.

- Eastside Light Rail Pedestrian Linkages: This project, sponsored by the City of Los Angeles, would improve pedestrian access to the Metro Gold Line to East Los Angeles stations, including the Little Tokyo/Arts District Station at 1st and Alameda Streets.

- Fashion District Streetscape Phase II: This project would provide streetscape and sidewalk enhancements to facilitate increased pedestrian activity between the Fashion District and the 7th Street transit corridor. The Fashion District is roughly bounded by 7th Street, Main Street, San Pedro Street, and the Santa Monica Freeway (I-10).

- Downtown Los Angeles Alternative Green Transit Modes Trial Program: This program would offer shared-ride bicycles and neighborhood electric vehicles as an alternative to existing DASH shuttle services for the purpose of accessing City Hall. City Hall is located within the block bounded by 1st, Spring, Temple, and Main Streets.

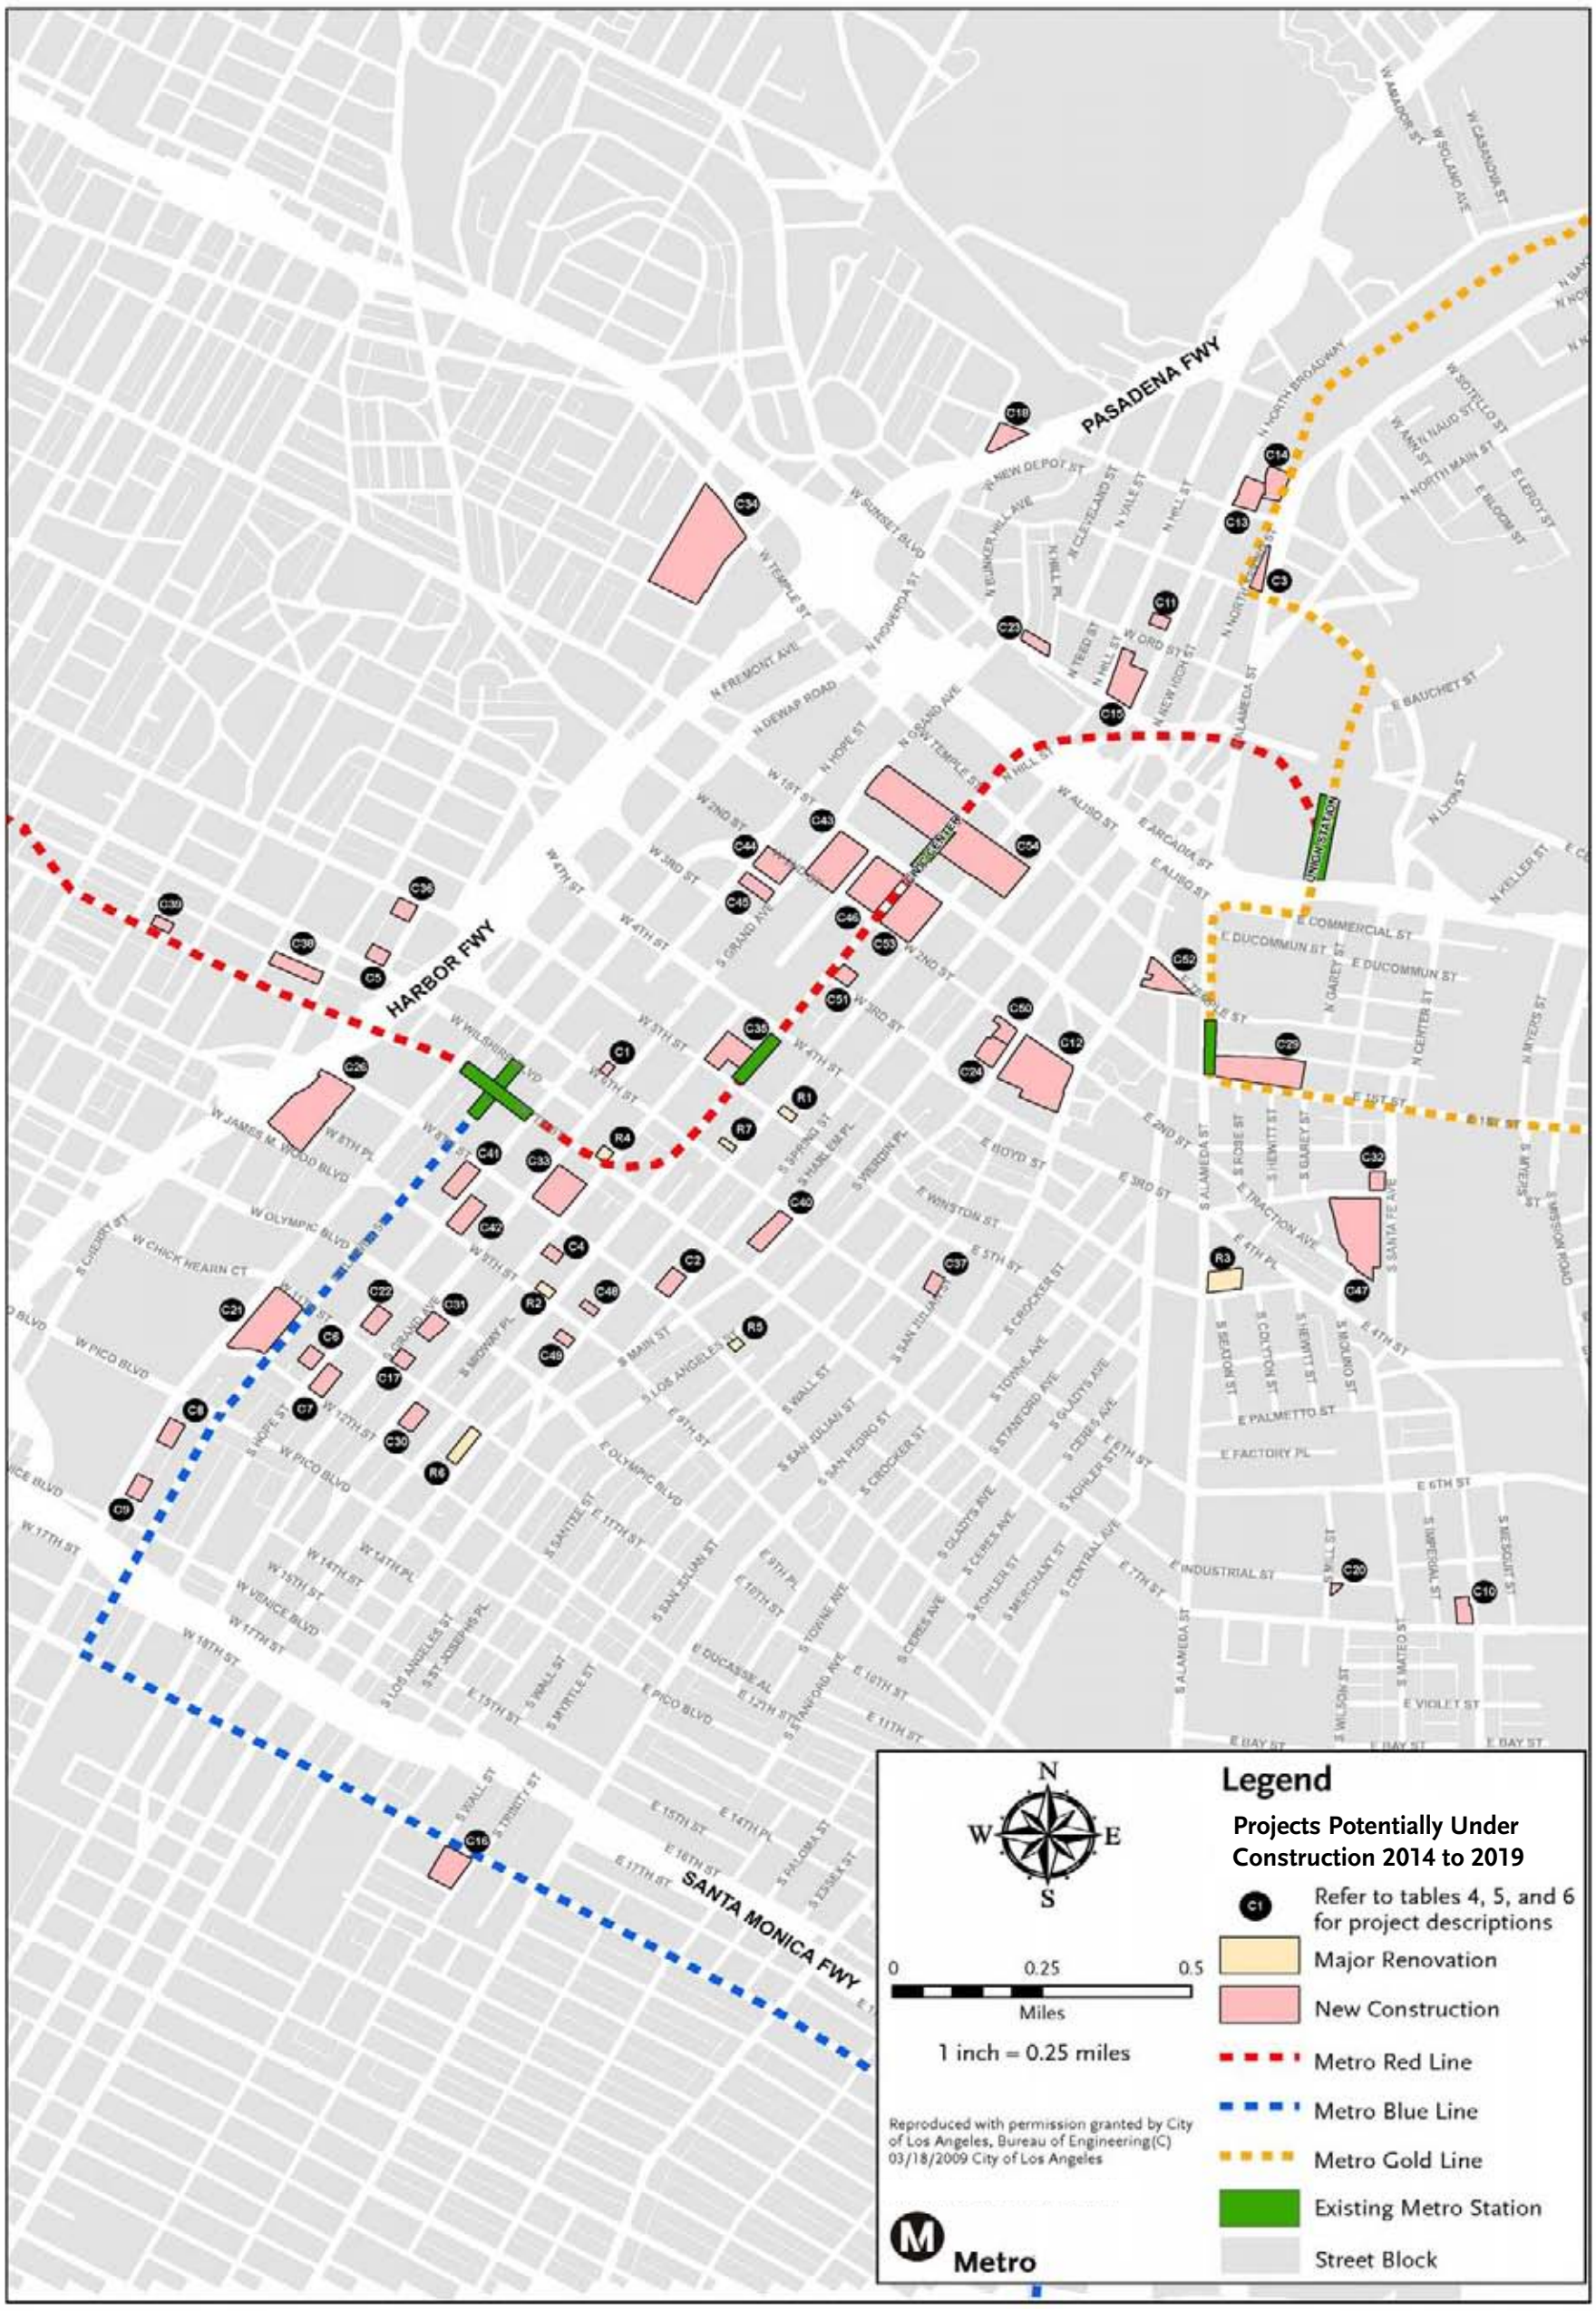

Figure 4-3. Projects Potentially Under Construction 2014 to 2019

- Little Tokyo Pedestrian Linkages: This City of Los Angeles project would create sidewalk and crosswalk enhancements to encourage pedestrian activity within the Little Tokyo area. The project also calls for new landscaping and street furniture.

- East Downtown Truck Access Improvements: This City of Los Angeles project calls for roadway improvements, widening, and restriping to facilitate truck access to the industrial area in the southeastern portion of the project area.

- Route 101 Southbound Improvements: This State of California Department of Transportation (Caltrans) project calls for replacement of the southbound Vignes Street and Hewitt Street ramps with new ramps at Garey Street on the northeast corner of the project area.

- Route 101 Pedestrian Bridge Enhancement: This City of Los Angeles project calls for the enhancement of pedestrian bridges across the Santa Ana Freeway (US 101) along the northern edge of the project area.

The following two projects are not currently included in the regional transportation plans listed above, however, these projects are in some stage of planning and could potentially occur during the construction period for the Regional Connector project.

- Resurrection of the Red Car Trolley Services in the Downtown Los Angeles Area: This project seeks to implement a historic streetcar service connecting the South Park, Financial District, South Broadway, and Little Tokyo areas of downtown Los Angeles. The service would be primarily, if not entirely, at grade and the tracks could potentially be constructed in existing mixed-flow lanes. Though streetcar technology is similar to light rail, the Red Car service would be more local in scope, with stops spaced every two blocks or so.

- Broadway Transit Mall: This project would close part of South Broadway to auto traffic, tentatively from 2nd Street to 9th Street, in order to create a pedestrian and transit mall. Under this plan, only transit buses and delivery trucks would be permitted to drive through the transit mall. Broadway currently experiences among the highest volumes in pedestrian traffic in Los Angeles, and this project would help alleviate crowding on the sidewalks.

The California High-Speed Rail project proposes to construct a 700-mile long electric-power, steel-wheel-on-steel-rail, high-speed train system from Sacramento to San Diego. The Los Angeles portion of the project would provide a connection between Palmdale and Orange County utilizing existing Metrolink right-of-way to connect to Union Station. The high speed rail system would likely be built as an elevated guideway connecting to the upper level of Union Station and transitioning to an at-grade system in or near the Burlington Northern

Sante Fe/Metrolink rail corridor (LOSSAN rail corridor). The high speed rail system would either share tracks with existing non-electric trains or operate using dedicated tracks within the LOSSAN rail corridor. Project buildout is anticipated for year 2030. The California High-Speed Rail project is designed to interface with existing passenger rail service and to provide additional capacity to meet increases in intercity travel demand in California. The Regional Connector Project would be constructed and operated in coordination with the California High-Speed Rail project. Metro would also coordinate and interface with the County of Los Angeles portion of the California High-Speed Rail project.

Utility Projects

No major utility projects have been identified within the project area during the construction period of 2014 to 2019. The City of Los Angeles maintains an extensive project list of public works projects. However, there do not appear to be many projects planned after 2014 within the City and there do not appear to be any planned within the project area. Most of the planned projects within the City are related to ongoing maintenance or replacement in kind of existing infrastructure.

4.1.3 Projects Potentially Under Construction post-2019

The existing databases and long-range plans do not include any reasonably foreseeable projects beyond 2019. For potential cumulative impacts beyond the year of opening, trend information on land use, and population and employment growth from adopted regional plans have been used. The cumulative impacts analysis includes positive impacts as well as adverse effects, particularly with respect to the enhancements in regional mobility that may be represented by the build alternatives when compared to the No Build Alternative.

5.0 IMPACTS

5.1 No Build Alternative

The No Build Alternative would not involve construction of a new light rail transit project in downtown. The No Build Alternative would not include any major service improvements or new transportation infrastructure beyond what is listed in Metro's 2009 Long Range Transportation Plan (LRTP). The transit network within the project area would be largely the same as it is now.

The No Build Alternative is expected to generate less than significant direct and indirect impacts related to the following environmental issues: traffic circulation, and parking; land use; displacement and relocation; community and neighborhoods; visual and aesthetic resources; noise and vibration; ecosystems and biological resources; geotechnical, subsurface, seismic hazards, and hazardous materials; water resources; energy resources; greenhouse gas (GHG) emissions; historic resources; archaeological resources; paleontological resources; parklands and other community facilities; Section 4(f) protected resources; economic and fiscal resources; safety and security; growth; and air quality. Therefore, this alternative would not contribute to cumulative impacts with respect to these environmental resources.

5.1.1 Transit, Traffic, Circulation, and Parking

It is anticipated that the current bus service would predominantly remain the same through the year 2035 No Build Alternative with increased headways for some of the most heavily travelled lines. In addition, increases would occur along the lines that would help feed more passengers into the downtown area along the rail corridors that would be joined by the Regional Connector. Transit patrons would continue to transfer twice to the Metro Red and Purple Lines through downtown in order to make a complete east-west or north-south trip. It is expected that transit service performance through the downtown area would likely decrease due to increased traffic congestion. This may make travel via transit a less attractive option for patrons traveling across downtown between Santa Monica and the I-605 or from Azusa to Long Beach.

Cumulative transit impacts associated with the No Build Alternative would be adverse as this alternative would not close the gap in the rail transit system and would not have the travel time and convenience benefits for transit users associated with the build alternatives. For transit patrons that have no other travel options, bus travel times would increase and transit usage would be less convenient due to worsening congestion. There would be a negative transit impact upon those that rely on the public transit system, for east-west and north south travel through the downtown area. This would result in an adverse, though less than siginificant, cumulative transit impact.

5.1.2 Environmental Justice

Cumulative transit impacts associated with the No Build Alternative would be adverse as this alternative would not close the gap in the rail transit system and would not have the travel time and convenience benefits for transit users associated with the build alternatives. This adverse transit impact would result in disproportionate impacts associated with transit service equity to minority, low-income communities, but no feasible mitigation (other than construction of one of the build alternatives) exists to minimize this impact. Therefore, the No Build Alternative would result in direct, indirect, and cumulative disproportionate adverse impacts related to transit service equity.

5.2 Transportation System Management (TSM) Alternative

The TSM Alternative includes two new express shuttle bus lines linking 7th Street/Metro Center Station and Union Station above and beyond the No Build Alternative elements. These buses would run frequently, especially during peak hours. The buses may have traffic signal priority similar to the Metro Rapid system, where the traffic signal control system grants longer green lights to oncoming transit vehicles. Enhanced bus stops would be located every two to three blocks to maximize coverage of the area surrounding the routes.

Implementation of the TSM alternative would result in less than significant direct and indirect impacts related to the following environmental issues: land use; displacement and relocation; community and neighborhoods; visual and aesthetic resources; noise and vibration; ecosystems and biological resources; geotechnical, subsurface, seismic hazards, and hazardous materials; water resources; energy resources; GHG emissions; parklands and other community facilities; Section 4(f) protected resources; economic and fiscal resources; safety and security; growth; and air quality. As a result, this alternative would not contribute to cumulative impacts with respect to these environmental resources.

Operation of the two added bus routes under the TSM Alternative would result in less-than-significant impacts to energy use and energy resources. Additionally, the TSM Alternative would result in a reduction in automobile VMT and energy consumption measured in British thermal units (BTUs) when compared to the horizon year No Build Alternative. This would result in a beneficial energy impact.

5.2.1 Transit, Traffic, Circulation, and Parking

Construction of the TSM Alternative would not result in any significant impacts, and, therefore, would not contribute to cumulative construction impacts.

Operation of the TSM Alternative would have a less than significant impact on other modes of transportation (bicycle and pedestrian facilities) and, therefore, the TSM Alternative would not contribute to a cumulative impact to these transportation systems.

For the TSM Alternative, the total daily, system-wide, linked trips for the entire bus and rail system is projected to be about 1,722,400, which is a 5,300-trip increase from the No Build Alternative. The proposed alternative would improve the east-west and north-south connections between stations; however, transit patrons would have to continue to transfer through downtown in order to make a complete trip. This may make travel via transit a less attractive option for patrons traveling across downtown between Santa Monica and the I-605 or from Azusa to Long Beach.

Cumulative transit impacts associated with the TSM Alternative would be adverse as this alternative would not close the gap in the rail transit system and would not have the travel time and convenience benefits for transit users associated with the build alternatives. For transit patrons that have no other travel options, bus travel times would increase and transit usage would be less convenient due to worsening congestion. There would be a negative impact upon those that rely on the public transit system, for east-west and north-south travel through the downtown area. This would result in a less-than-significant adverse cumulative transit impact.

Projections show similar urban rail boardings compared to the No Build Alternative; however, the proposed TSM shuttle bus service is projected to carry 42,700 daily boardings. Although this alternative does not result in a negative transit impact, it is considered a marginal improvement over the No Build Alternative.

With implementation of potential mitigation measures identified in the Transportation Technical Memorandum, operation of the TSM Alternative would not result in a considerable contribution to cumulative impacts associated with traffic circulation or parking.

5.2.2 Cultural Resources – Archaeology

Construction of the TSM Alternative has the potential to affect archaeological resources within the APE, including previously unidentified archaeological resources and the Los Angeles zanja system. Implementation of potential mitigation measures identified in the Cultural Resources – Archaeology Technical Memorandum would reduce project-level impacts to previously unidentified archaeological resources to a less than significant level. Therefore, the TSM Alternative would not contribute to a cumulative impact on these resources.

5.2.3 Cultural Resources – Paleontology

Construction of the TSM Alternative has the potential to directly affect paleontological resources within the project area should excavations related to the construction of new bus stations occur in paleontologically sensitive geologic units. Implementation of potential mitigation measures identified in the Cultural Resources – Paleontology Technical Memorandum would reduce adverse impacts to a less than significant level. Therefore, the TSM Alternative would not contribute to a cumulative impact on these resources.

5.2.4 Environmental Justice

The environmental justice analysis treated potential environmental justice impacts to Little Tokyo with special attention given its historical and cultural importance. Although it has shrunk significantly in size, and most of the Japanese-American population has migrated to the suburbs, Little Tokyo remains the historical focal point for Japanese-Americans in the Los Angeles region.

Cumulative transit impacts associated with the TSM Alternative would be adverse as this alternative would not close the gap in the rail transit system and would not have the travel time and convenience benefits for transit users associated with the build alternatives. This adverse transit impact would result in disproportionate impacts associated with transit service equity and safety and security to minority and low-income communities.

Implementation of potential mitigation measures identified in the Environmental Justice Technical Memorandum would reduce potential disproportionate adverse impacts associated with safety and security to less than significant. Therefore, the TSM Alternative would not contribute to disproportionate cumulative impacts associated with safety and security. However, no feasible mitigation exists (other than construction of either of the two build alternatives) that would minimize the transit service equity impacts. Therefore, the TSM Alternative would result in disproportionate cumulative adverse impacts related to transit service equity.

5.3 At-Grade Emphasis LRT Alternative

The At-Grade Emphasis LRT Alternative extends from the underground 7th Street/Metro Center Station, heads north under Flower Street, resurfaces to at-grade north of 4th Street, crosses 3rd Street at-grade, enters Bunker Hill, and turns northeast through a new entrance to the existing 2nd Street tunnel. The new underground portions of the alignment would be constructed using the cut and cover method, which is described in detail in the Description of Construction. After entering the 2nd Street tunnel, the alignment continues along 2nd Street and it splits into an at-grade couplet configuration traveling north on Main and Los Angeles Streets (one track on each roadway). Then it heads east on Temple Street, realigns into a dual track configuration just east of Los Angeles Street, and connects to the Metro Gold Line to East Los Angeles in a 3-way junction north of the Little Tokyo/Arts District Station on Alameda Street. Due to the high volume of heavy regional auto and truck traffic that travels along Alameda Street, an automobile underpass and a potential pedestrian overpass would be constructed at the intersection of Temple and Alameda Streets to reduce pedestrian-train and automobile-train conflicts.

Implementation of the At-Grade Emphasis LRT Alternative is not anticipated to contribute to an adverse cumulative effect related to the following environmental issues: land use; visual or

aesthetic resources; water resources; energy resources; GHG emissions; parklands or other community facilities; or cause growth inducement.

The alignment passes near several potential development sites, and plans for these sites include high density employment and residential facilities. The At-Grade Emphasis LRT Alternative combined with other projects could also support increases in residential development within the project area which would be a beneficial land use effect.

Implementation of the At-Grade Emphasis LRT Alternative would result in a decrease in highway VMT, which would subsequently result in a net decrease in energy consumption measured in both BTU's and barrels of oil. This net decrease in BTUs and barrels of oil would result in a beneficial impact to energy resources.

Potential beneficial economic impacts associated with the At-Grade Emphasis LRT Alternative include improved accessibility and mobility for the region, which would potentially encourage greater economic activity; and beneficial impacts for businesses and employees traveling to and from work.

5.3.1 Transit, Traffic, Circulation, and Parking

During construction of the At-Grade Emphasis LRT Alternative, temporary lane closures and/or street closures, relocation of bus stops, temporary removal of several parking and loading stalls, and temporary sidewalk closures may occur. However, light rail service would be maintained during construction of the alternative. Even with implementation of possible mitigation, construction of the alternative would result in significant and unavoidable impacts associated with bus transit, traffic circulation, and pedestrian and bicycle movements. Therefore, the At-Grade Emphasis LRT Alternative could result in a considerable contribution to cumulative construction impacts.

Operation of the At-Grade Emphasis LRT Alternative would have a less than significant impact on transit systems and would not result in a cumulative impact to transit systems. This alternative proposes a light rail alignment to provide a link between the 7th Street/Metro Center Station and Metro Gold Line at Temple and Alameda Streets. This connection would provide a direct east-west route between the I-605 and the City of Santa Monica and a direct north-south route between the Cities of Azusa and Long Beach. Consequently, transit patrons could travel from east-west or north-south without having to make a transfer in the downtown area. Additionally, the At-Grade Emphasis LRT Alternative would result in a significant beneficial impact to transit systems compared to the No Build and TSM Alternatives.

Development of the At-Grade Emphasis LRT Alternative would result in the permanent removal of 80 on-street parking and loading spaces. In addition, the reduction in travel lanes associated with operation of the alternative would impact bikeways and pedestrian crosswalks and sidewalks. With implementation of possible mitigation identified in the Transportation

Technical Memorandum, the At-Grade Emphasis LRT Alternative would not result in a considerable contribution to cumulative impacts associated with parking or other modes of transportation (bicycle and pedestrian facilities).

Under the year 2035 traffic forecasts for the At-Grade Emphasis LRT Alternative, a total of 18 intersections during the AM peak hour and 26 intersections during the PM peak hour would be impacted. During the AM peak hour, seven intersections could be mitigated to a level of insignificance. During the PM peak hour, 11 intersections could be mitigated to a level of insignificance. Therefore, the At-Grade Emphasis LRT Alternative would not contribute to cumulative impacts at these intersections. After implementation of the proposed mitigation measures, significant impacts would remain at the 11 of the 26 impacted intersections during the AM peak hour and 15 intersections during the PM peak hour. Operation of the At-Grade Emphasis LRT Alternative would result in a considerable contribution to significant cumulative impacts at 11 intersections during the AM peak hour and 15 intersections during the PM peak hour. Please refer to the Transportation Technical Memorandum for more information regarding impacted intersections.

It should be noted, a number of intersections would improve with operation of the At-Grade Emphasis LRT Alternative over the No Build Alternative by virtue of a reduction in delay. During the AM peak hour seven intersections show delay improvements and eight intersections show delay improvements in the PM peak hour.

5.3.2 Displacement and Relocation

By the year 2019, planned future developments would displace several existing parking lots. These new developments, mostly residential, would provide the required parking for their residents, but the stock of publicly accessible parking would be greatly reduced. The At-Grade Emphasis LRT Alternative would result in permanent displacement of 170 parking spaces (including 47 on-street parking spaces), 23 spaces in Little Tokyo, where the community has expressed concern over the potential loss of parking. Surface parking lots in downtown Los Angeles are an important community resource because many of the older, historical and civic buildings do not provide the amount of on-site, off-street parking required under current planning code, resulting in an overall parking deficit. The loss of publicly accessible surface parking in Little Tokyo and in other downtown Los Angeles areas due to the At-Grade Emphasis LRT Alternative in conjunction with other planned developments would not represent a cumulative loss with respect to parking. Other potential effects are discussed under environmental justice (Section 5.3.12).

Typically, transit projects themselves serve as mitigation for the loss of parking because they would remove vehicles on the road, thereby reducing the demand for parking. The Regional Connector will provide new non-auto access to downtown, including Little Tokyo. Therefore,

the proposed At-Grade Emphasis LRT Alternative would partially offset potential adverse impacts due to loss of parking.

5.3.3 Community and Neighborhood

The At-Grade Emphasis LRT Alternative would result in a beneficial cumulative impact to community mobility, population, housing and employment, and is not anticipated to contribute to any adverse cumulative effects with respect to viability of existing businesses or emergency services. With implementation of potential mitigation measures identified in the Community and Neighborhood Impacts Technical Memorandum, the At-Grade Emphasis LRT Alternative would not adversely contribute to cumulative impacts with regards to public health, safety, crime, community resources, or events.

5.3.4 Noise and Vibration

Project-level noise and vibration impacts from operation of the At-Grade Emphasis LRT Alternative would be less than significant and would not contribute to cumulative noise or vibration impacts.

Compliance with Section 41.40(a) of the Los Angeles Municipal Code and any variance to the Code would ensure that noise and vibration levels associated with construction of the At-Grade Emphasis LRT Alternative would not result in an adverse impact. However, sensitive and/or historic buildings within 21 feet of the construction may be susceptible to vibration damage. Implementation of potential mitigation measures would reduce potentially significant project-level impacts to sensitive or historic buildings, within 21 feet of construction, to a less than significant level. With implementation of potential mitigation measures identified in the Noise and Vibration Technical Memorandum, construction of the At-Grade Emphasis LRT Alternative would not contribute to potentially adverse cumulative noise or vibration impacts.

5.3.5 Ecosystems and Biological Resources

Construction activities associated with future projects within the project area have the potential to affect migratory birds if nesting habitat is disturbed during the breeding season. Other ongoing and future construction projects would be required to implement potential mitigation measures to address any potential impacts to migratory birds under either the Migratory Bird Treaty Act or the California Fish and Game Code. There would be no cumulative impacts from the At-Grade Emphasis LRT Alternative with respect to biological resources.

5.3.6 Geotechnical/Subsurface/Seismic/Hazardous Materials

There is the potential for cumulative impacts associated with hazards and hazardous materials from the At-Grade Emphasis LRT Alternative. A number of related construction

projects have been identified and some of those projects could involve ground-disturbing construction where there is potential to encounter hazardous materials in soil and/or groundwater. In addition, other construction activities in the project area may entail building demolition, with the potential for release of asbestos fibers from asbestos containing materials and lead particles from lead-based paint. The additive effect of on-going and future activities could result in cumulative impacts to human health or the environment through release of hazardous materials. While these construction activities would require compliance with applicable hazardous waste laws and regulations, potential mitigation measures would also ensure cumulative impacts would be less than significant.

5.3.7 Cultural Resources – Built Environment

Construction of the At-Grade Emphasis LRT Alternative would potentially result in one direct significant impact and 14 indirect significant impacts to historical resources. All of these potential impacts could result in a substantial adverse change to a historical resource. Implementation of mitigation measures identified in Cultural Resources – Built Environment Technical Memorandum would reduce these potential impacts to a less than significant level. Project operation is not expected to cause direct or indirect impacts. Therefore, this alternative would not contribute to cumulative impacts on historic resources.

5.3.8 Cultural Resources – Archaeology

Construction of the At-Grade Emphasis LRT Alternative has the potential to affect archaeological resources within the APE, including previously unidentified archaeological resources and previously undiscovered portions of site RC-1. However, implementation of potential mitigation measures identified in that technical memorandum would reduce this potential impact to a less than significant level and this alternative would not contribute to cumulative impacts on these resources.

5.3.9 Cultural Resources – Paleontology

The At-Grade Emphasis LRT Alternative has the potential to adversely impact paleontological resources within the project area as a result of ground disturbance related to constructing new underground tunnel segments on Flower Street between 7th and Hope Streets and new stations. However, implementation of potential mitigation measures identified in Cultural Resources – Paleontology Technical Memorandum would reduce potential adverse impacts to a less than significant level. Therefore, the At-Grade Emphasis LRT Alternative would not contribute to a cumulative impact on these paleontological resources.

5.3.10 Economic and Fiscal

Implementation of mitigation measures identified in the Economic and Fiscal Impacts Technological Memorandum, such as compensation to property owners and business owners, would lessen potential construction impacts. Dependent upon the successful

implementation of mitigation where required during construction, some residual impacts could still occur during construction. Given the related projects that could be under construction during the same time as the proposed alternative, construction of the alternative could result in a considerable contribution to cumulative impacts on activity levels and revenue of businesses along the alignment. All other economic impacts on property tax, economic output, and employment associated with construction and operation of the alternative would be less than significant. Therefore, At-Grade Emphasis LRT Alternative would not contribute to a cumulative economic impact.

Potential beneficial economic impacts associated with the At-Grade Emphasis LRT Alternative include indirect and direct employment growth, with the potential to add 13,800 employees to the area economy; improved accessibility and mobility for the region, which would potentially encourage greater economic activity; and benefits for businesses and employees traveling to and from work.

5.3.11 Safety and Security

Potential cumulative impacts of the At-Grade Emphasis LRT Alternative were qualitatively assessed in parallel to other known projects out to the baseline year (year 2035). Within the area of influence of this proposed alternative, there are a variety of major renovations to existing buildings, new facility construction, transportation projects, and mixed use developments under consideration. However, each of these projects would address safety and security of pedestrians and motorists accessing the developments. From a cumulative perspective, potential impacts associated with the At-Grade Emphasis LRT Alternative would be mitigated to a less-than-significant level and not have a cumulative effect on the safety and security environment in the project area. Please refer to the Safety and Security Technical Memorandum for potential mitigation measures related to the At-Grade Emphasis LRT Alternative.

5.3.12 Environmental Justice

The environmental justice analysis treated potential environmental justice impacts to Little Tokyo with special attention given its historical and cultural importance. Although it has shrunk significantly in size, and most of the Japanese-American population has migrated to the suburbs, Little Tokyo remains the historical focal point for Japanese-Americans in the Los Angeles region.

The At-Grade Emphasis LRT Alternative would result in the following disproportionate potential cumulative impacts: loss of parking in Little Tokyo and impacts to community cohesion/viability of Little Tokyo due to parking losses. Implementation of possible mitigation measures included in the Environmental Justice Technical Memorandum would reduce the project's contribution to disproportionate cumulative impacts associated with these environmental topics to a less than significant level.

5.3.13 Air Quality Impacts and Health Risk Assessment

Operational emissions for the At-Grade Emphasis LRT Alternative would be less than significant under both CEQA and NEPA thresholds. Regional construction emissions of VOC, NOx, CO, and $PM_{2.5}$ would result in significant air quality impacts under CEQA. Even with required up-to-date (2014 to 2017) equipment during construction as mitigation, regional construction emissions would remain significant and unavoidable.

Although regional construction emissions under the At-Grade Emphasis LRT Alternative would be significant and unavoidable, operation of the alternative would reduce regional VMT, which would result in a beneficial impact to air quality and outweigh the temporary adverse construction impacts.

5.4 Underground Emphasis LRT Alternative

The Underground Emphasis LRT Alternative would connect directly to the tracks at 7th Street/Metro Center Station and continue north underneath Flower Street to 3rd Street and then northeast to 2nd and Hope Streets. Tracks would then proceed east underneath the 2nd Street tunnel and 2nd Street to Central Avenue. Tracks would then veer north into a new portal on the private property bounded by 1st Street, Alameda Street, 2nd Street, and Central Avenue. The tracks would then enter the intersection of 1st and Alameda Streets in the same type of three-way junction planned for the At-Grade Emphasis LRT Alternative, with a potential pedestrian overpass and a vehicular underpass for through traffic on Alameda Street.

Implementation of the Underground Emphasis LRT Alternative is not anticipated to contribute to an adverse cumulative effects related to the following environmental issues: land use; visual or aesthetic resources; water resources; energy resources; GHG emissions; parklands and other community facilities; Section 4(f) protected resources; or growth inducement.

The alignment passes near several potential development sites, and plans for these sites include high density employment and residential facilities. The Underground Emphasis LRT Alternative combined with other projects could also support increases in residential development within the project area which would be a beneficial land use effect.

Implementation of the Underground Emphasis LRT Alternative would result in a decrease in highway VMT, which would subsequently result in a net decrease in energy consumption measured in both BTU's and barrels of oil. This net decrease in BTUs and barrels of oil would result in a beneficial impact to energy resources.

Potential beneficial economic impacts associated with the Underground Emphasis LRT Alternative include improved accessibility and mobility for the region, which would potentially

encourage greater economic activity; and beneficial impacts for businesses and employees traveling to and from work.

5.4.1 Transit, Traffic, Circulation, and Parking

During construction of the Underground Emphasis LRT Alternative, temporary lane closures and/or street closures, relocation of bus stops, temporary removal of several parking and loading stalls, and temporary sidewalk closures may occur. However, light rail service would be maintained during construction of the alternative. Even with implementation of possible mitigation, construction of the Underground Emphasis LRT Alternative would result in significant and unavoidable construction impacts associated with bus transit, traffic circulation, and pedestrian and bicycle movements. Therefore, the Underground Emphasis LRT Alternative could result in a considerable contribution to cumulative construction impacts.

Operation of the Underground Emphasis LRT Alternative would have a less than significant impact on transit systems and would not result in a cumulative impact to transit systems. This alternative proposes a light rail alignment to provide a link between the 7th Street/Metro Center Station and Metro Gold Line at the Little Tokyo/Arts District Station. This connection would provide a direct east-west route between the I-605 and the City of Santa Monica and a direct north-south route between the Cities of Azusa and Long Beach. Consequently, transit patrons could travel from east-west or north-south without having to make a transfer in the downtown area. Additionally, the Underground Emphasis LRT Alternative would result in a significant beneficial impact to the regional transit system compared to the No Build and TSM Alternatives.

Development of the Underground Emphasis LRT Alternative would result in the permanent removal of 20 on-street parking and loading spaces. With implementation of possible mitigation identified in the Transportation Technical Memorandum, the Underground Emphasis LRT Alternative would not result in a considerable contribution to cumulative impacts associated with parking or other modes of transportation (bicycle and pedestrian facilities).

Under the year 2035 traffic forecasts for the Underground Emphasis LRT Alternative, a total of three intersections would be impacted during the AM peak hour and seven intersections would be impacted during the PM peak hour. During the AM peak hour, one intersection would be mitigated to a less than significant level. During the PM peak hour, four intersections would be mitigated to a less than significant level. Therefore, the Underground Emphasis LRT Alternative would not contribute to cumulative impacts at these intersections. After implementation of the proposed mitigation measures, significant impacts would remain at two intersections (Alameda St./2nd St. and Flower St./4th St.) during the AM peak hour and three intersections (Judge John Aiso St./1st St., Alameda St./2nd St., and Judge John Aiso

St./Temple St.) during the PM peak hour. In summary, operation of the Underground Emphasis LRT Alternative would result in a considerable contribution to significant cumulative impacts at two intersections during the AM peak hour and three intersections during the PM peak hour. Please refer to the transportation Technical Memorandum for more information regarding cumulatively impacted intersections.

It should be noted, a number of intersections would improve under the Underground Emphasis LRT Alternative from the No Build Alternative by virtue of a reduction in delays. During the AM peak hour five intersections show delay improvements and eight intersections show delay improvements in the PM peak hour. It should also be noted that the inclusion of the Regional Connector would increase the person-carrying capacity through the downtown transportation environment without adversely impacting overall traffic operations.

5.4.2 Displacement and Relocation

By the year 2019, related projects would displace several current parking lots. These new developments, mostly residential, would provide the required parking for their tenants, but the stock of publicly accessible parking would be reduced.

The Underground Emphasis LRT Alternative could permanently displace between 148 and 281 parking spaces. Of these displaced parking spaces, 139 of them would be in Little Tokyo, where the community has expressed concern over the potential loss of parking. The displaced parking spaces would be replaced in an existing lot.

Surface parking lots in downtown Los Angeles are an important community resource. The loss of publicly accessible surface parking in Little Tokyo due to the proposed project would represent a cumulative loss with respect to parking. Other potential effects are discussed under environmental justice (Section 5.4.12). Transit projects themselves typically serve as mitigation for the loss of parking because they reduce dependence on vehicles on the road, thereby reducing the demand for parking. The Regional Connector would provide new non-auto access to downtown, including Little Tokyo. Therefore, the Underground Emphasis LRT Alternative would partially offset potential adverse impacts due to loss of parking.

5.4.3 Community Neighborhood

The Underground Emphasis LRT Alternative would result in a beneficial cumulative impact to community mobility, population, housing and employment, and is not anticipated to contribute to any adverse cumulative effects with respect to viability of existing businesses or emergency services. With implementation of the potential mitigation measures identified in the Community and Neighborhood Impacts Technical Memorandum, the Underground Emphasis LRT Alternative would not adversely contribute to cumulative impacts with regards to public health, safety, crime, community resources, or events.

5.4.4 Noise and Vibration

Project-level noise and vibration impacts from operation of the Underground Emphasis LRT Alternative would be less than significant. Operation of the Underground Emphasis LRT Alternative would not contribute to cumulative noise or vibration impacts.

Compliance with Section 41.40(a) of the Los Angeles Municipal Code and any variance to the Code would ensure that noise and vibration levels associated with construction of the Underground Emphasis LRT Alternative would not result in an adverse impact. However, sensitive and/or historic buildings within 21 feet of the construction may be susceptible to vibration damage. Implementation of potential mitigation measures would reduce potentially significant project-level impacts to sensitive or historic buildings, within 21 feet of construction, to a less than significant level. With implementation of potential mitigation measures identified in the Noise and Vibration Technical Memorandum, construction of the Underground Emphasis LRT Alternative would not contribute to potentially adverse cumulative noise or vibration impacts.

5.4.5 Ecosystems and Biological Resources

Construction activities associated with future projects within the project area have the potential to affect migratory birds if nesting habitat is disturbed during the breeding season. Other ongoing and future construction projects would be required to implement mitigation measures to address any potential impacts to migratory birds under either the Migratory Bird Treaty Act or the California Fish and Game Code. There would be no cumulative impacts from the Underground Emphasis LRT Alternative with respect to biological resources.

5.4.6 Geotechnical/Subsurface/Seismic/Hazardous Materials

There is the potential for cumulative impacts associated with hazards and hazardous materials from the Underground Emphasis LRT Alternative. Construction associated with on-going and future projects in the project area could result in cumulative impacts to human health or the environment through release of hazardous materials encountered in soil and/or groundwater, or released during building demolition. Compliance with applicable hazardous waste laws and regulations, along with potential mitigation measures identified in the Geotechnical/Subsurface/Seismic/Hazardous Materials Technical Memorandum, would ensure these potential cumulative impacts would be less than significant.

5.4.7 Cultural Resources – Built Environment

Implementation of potential mitigation measures identified in Cultural Resources – Built Environment Technical Memorandum would reduce potential impacts to historic resources to a less than significant level. This alternative would not contribute to cumulative impacts on historic resources. See the Cultural Resources – Built Environment Technical Memorandum for more information on specific historic resources.

5.4.8 Cultural Resources – Archaeology

Construction of the Underground Emphasis LRT Alternative has the potential to affect archaeological resources within the APE, including previously unidentified archaeological resources, the Los Angeles zanja system, and site CA-LAN-3588. However, implementation of potential mitigation measures identified in Cultural Resources – Archaeology Technical Memorandum would reduce this potential impact to a less than significant level. Therefore, this alternative would not contribute to cumulative impacts on these resources.

5.4.9 Cultural Resources – Paleontology

The Underground Emphasis LRT Alternative involves ground disturbance, and therefore has potential to adversely affect paleontological resources within the project area. This disturbance would result from excavations to construct a new underground tunnel along the alternative's entire route, underground stations, and a proposed pedestrian bridge at the intersection of Alameda and 1st Streets. However, implementation of potential mitigation measures identified in Cultural Resources – Paleontology Technical Memorandum would reduce impacts to paleontological resources to below level of significance. Therefore, the Underground Emphasis LRT Alternative would not contribute to a cumulative impact on paleontological resources.

5.4.10 Economic and Fiscal

Implementation of mitigation measures identified in the Economic and Fiscal Impacts Technological Memorandum, such as compensation to property owners and business owners, would lessen potential construction impacts. Dependent upon the successful implementation of mitigation where required during construction, some residual impacts could still occur during construction. Given the related projects that could be under construction during the same time as the proposed alternative, construction of the alternative could result in a considerable contribution to cumulative impacts on activity levels and revenue of businesses along the alignment. All other potential economic impacts on property tax, economic output, and employment associated with construction and operation of the alternative would be less than significant and the Underground Emphasis LRT Alternative would not contribute to a cumulative economic impact.

Beneficial economic impacts associated with the Underground Emphasis LRT Alternative include indirect and direct employment growth, with the potential to add 20,800 employees to the area economy; improved accessibility and mobility for the region, which would potentially encourage greater economic activity; and benefits for businesses and employees traveling to and from work.

5.4.11 Safety and Security

Potential cumulative impacts of the Underground Emphasis LRT Alternative are qualitatively assessed in parallel to other known projects out to the baseline year (year 2035). Within the area of influence of this proposed alternative, there are a variety of major renovations to existing buildings, new facility construction, transportation projects, and mixed-use developments under consideration. Each of these projects would address the safety and security of pedestrians and motorists accessing the developments. From a cumulative perspective, potential impacts associated with the Underground Emphasis LRT Alternative would be mitigated to a less than significant level and they would not have a cumulative effect on the safety and security environment in the project area. Please refer to the Safety and Security Technical Memorandum for a description of potential mitigation measures.

5.4.12 Environmental Justice

The environmental justice analysis treated potential environmental justice impacts to Little Tokyo with special attention given its historical and cultural importance. Although it has shrunk significantly in size, and most of the Japanese-American population has migrated to the suburbs, Little Tokyo remains the historical focal point for Japanese-Americans in the Los Angeles region.

The Underground Emphasis LRT Alternative would result in the following disproportionate cumulative impacts: loss of parking in Little Tokyo and impacts to community cohesion/viability of Little Tokyo due to parking losses. Implementation of possible mitigation measures included in the Environmental Justice Technical Memorandum would reduce the project's contribution to potential disproportionate cumulative impacts to a less than significant level.

5.4.13 Air Quality Impacts and Health Risk Assessment

Operational emissions for the Underground Emphasis LRT Alternative would be less than significant under both CEQA and NEPA thresholds. Regional construction emissions of VOC, NOx, CO, and $PM_{2.5}$ would result in significant air quality impacts under CEQA. Even with required up-to-date (2014 to 2017) equipment during construction as mitigation, regional construction emissions would remain significant and unavoidable.

Although regional construction emissions under the Underground Emphasis LRT Alternative would be significant and unavoidable, operation of the alternative would reduce regional VMT, which would result in a beneficial impact to air quality and outweigh temporary adverse construction impacts.

5.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

The Fully Underground LRT Alternative - Little Tokyo Variation 1 would connect directly to the tracks at 7th Street/Metro Center Station and continue north underneath Flower Street to 3rd Street and northeast to 2nd and Hope Streets. Tracks would then proceed east underneath the 2nd Street tunnel and 2nd Street to Central Avenue. Tracks would then veer north beneath the private property bounded by 1st, Alameda, and 2nd Streets, and Central Avenue. Next, the tracks would enter a junction beneath the intersection of 1st and Alameda Streets.

From the junction, the track would diverge into two directions. One set of tracks bound for Azusa would proceed north and rise through a portal just northeast of the intersection of Temple and Alameda Streets. Here, the track would connect to the Metro Gold Line LRT bridge over US 101. Another set of tracks, bound for the San Gabriel Valley, would proceed east from the junction and rise through a new portal in the middle of 1st Street between Alameda and Hewitt Streets. These tracks would connect to the existing Metro Gold Line to East Los Angeles tracks.

Implementation of the Fully Underground LRT Alternative – Little Tokyo Variation 1 is not anticipated to contribute to an adverse cumulative effect related to the following environmental issues: land use; visual or aesthetic resources; water resources; energy resources; GHG emissions; parklands and other community facilities; Section 4(f) protected parks, recreation areas, or refuges; or growth inducement.

The alignment passes near several potential development sites, and plans for these sites include high density employment and residential facilities. The Fully Underground LRT Alternative – Little Tokyo Variation 1 combined with other projects could also support increases in residential development within the project area which would also be a beneficial land use effect.

Implementation of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in a decrease in highway VMT, which would subsequently result in a net decrease in energy consumption as measured in both BTU's and barrels of oil. This net decrease in BTUs and barrels of oil would result in a beneficial impact to energy resources.

Potential beneficial economic impacts associated with the Fully Underground LRT Alternative – Little Tokyo Variation 1 include improved accessibility and mobility for the region, which would potentially encourage greater economic activity; and beneficial impacts for businesses and employees traveling to and from work.

5.5.1 Transit, Traffic, Circulation, and Parking

During construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1, temporary lane closures and/or street closures, relocation of bus stops, temporary removal of

several parking and loading stalls, and temporary sidewalk closures may occur. However, light rail service would be maintained during construction of the alternative. Even with implementation of possible mitigation, construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in significant and unavoidable construction impacts to bus transit, traffic circulation, and pedestrian and bicycle movements. Therefore, the Fully Underground LRT Alternative – Little Tokyo Variation 1 could result in a considerable contribution to cumulative construction impacts.

Operation of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would have a less than significant impact on transit systems and parking and, therefore, would not result in a cumulative impact to these resources. This alternative proposes a light rail alignment to provide a link between the 7th Street/Metro Center Station and Metro Gold Line at 1st and Alameda Streets. This connection would provide a direct east-west route between the I-605 and the City of Santa Monica and a direct north-south route between the Cities of Azusa and Long Beach. Consequently, transit patrons could travel from east-west or north-south without having to make a transfer in the downtown area. Additionally, the Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in a significant beneficial impact to transit systems compared to the No Build and TSM Alternatives.

With implementation of possible mitigation identified in the Transportation Technical Memorandum, the Fully Underground LRT Alternative – Little Tokyo Variation 1 would not contribute to cumulative impacts associated with other modes of transportation (bicycle and pedestrian facilities).

Under the year 2035 traffic forecasts for the Fully Underground LRT Alternative – Little Tokyo Variation 1, one intersection would be impacted during the AM peak hour and three intersections would be impacted during the PM peak hour. During the PM peak hour, all three intersections would be mitigated to a less than significant level. Therefore, the Fully Underground LRT Alternative – Little Tokyo Variation 1 would not contribute to cumulative impacts at these intersections during the PM peak hour. After implementation of the proposed mitigation measures, significant impacts would remain at one intersection during the AM peak hour. In summary, operation of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in a considerable contribution to significant cumulative impacts at one intersection (Flower Street/ 4th Street) during the AM peak hour. Please refer to the Transportation Technical Memorandum for more information regarding cumulatively impacted intersections.

It should be noted, a number of intersections would improve under the Fully Underground LRT Alternative – Little Tokyo Variation 1 compared to the No Build Alternative by virtue of a reduction in delays. During the AM peak hour, four intersections show delay improvements and seven intersections show delay improvements in the PM peak hour. It should also be noted that the inclusion of the Regional Connector would increase the person-carrying

capacity through the downtown transportation environment without adversely impacting overall traffic operations.

5.5.2 Displacement and Relocation

Cumulative impacts under the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be similar to those under the Underground Emphasis LRT Alternative and potential mitigation measures would also be similar. The Fully Underground LRT Alternative – Little Tokyo Variation 1 would greatly enhance non-auto access by rail to downtown and Little Tokyo. This would partly offset some of the potential loss of parking in the downtown area. Therefore, this alternative would partly self-mitigate potential cumulative impacts associated with displacement and relocation.

5.5.3 Community and Neighborhoods

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in a beneficial cumulative impact to community mobility, population, housing and employment, and would not contribute to any adverse cumulative effects with respect to viability of existing businesses or emergency services. With implementation of potential mitigation measures identified in the Community and Neighborhood Impacts Technical Memorandum, the Fully Underground LRT Alternative – Little Tokyo Variation 1 would not adversely contribute to cumulative impacts with regards to public health, safety, crime, community resources, or events.

5.5.4 Noise and Vibration

Project-level noise and vibration impacts from operation of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be less than significant. As a result, operation of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would not contribute to cumulative noise or vibration impacts.

Compliance with Section 41.40(a) of the Los Angeles Municipal Code and any variance to the Code would ensure that noise and vibration levels associated with construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would not result in an adverse impact. However, sensitive and/or historic buildings within 21 feet of the construction may be susceptible to vibration damage. Implementation of potential mitigation measures would reduce potentially significant project-level impacts to sensitive or historic buildings within 21 feet of construction to a less than significant level. With implementation of potential mitigation measures identified in the Noise and Vibration Technical Memorandum, construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would not contribute to potentially adverse cumulative noise or vibration impacts.

5.5.5 Ecosystems and Biological Resources

Construction activities associated with future projects within the project area have the potential to affect migratory birds if nesting habitat is disturbed during the breeding season. Other ongoing and future construction projects would be required to implement mitigation measures to address any potential impacts to migratory birds under either the Migratory Bird Treaty Act or the California Fish and Game Code. Therefore, there would be no cumulative impacts from the Fully Underground LRT Alternative – Little Tokyo Variation 1 with respect to biological resources.

5.5.6 Geotechnical/Subsurface/Seismic/Hazardous Materials

Cumulative impacts from the Fully Underground LRT Alternative – Little Tokyo Variation 1 could occur if there were a release of hazardous materials during on-going and future projects in the project area that resulted in cumulative impacts to human health or the environment. Compliance with applicable hazardous waste laws and regulations, along with potential mitigation measures identified in the Geotechnical/Subsurface/Seismic/Hazardous Materials Technical Memorandum, would ensure these potential cumulative impacts would be less than significant.

5.5.7 Cultural Resources – Built Environment

Implementation of potential mitigation measures identified in Cultural Resources – Built Environment Technical Memorandum would reduce impacts to historic resources to a less than significant level. Therefore, this alternative would not contribute to cumulative impacts on historic resources. Please refer to the Cultural Resources – Built Environment Technical Memorandum for more information about specific historic resources.

5.5.8 Cultural Resources – Archaeology

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 has the potential to affect archaeological resources within the APE, including previously unidentified archaeological resources, the Los Angeles zanja system, and sites CA-LAN-3588, P-19-003338, and P-19-003339. However, implementation of potential mitigation measures identified in Cultural Resources – Archaeology Technical Memorandum would reduce this potential impact to a less than significant level. Therefore, this alternative would not contribute to cumulative impacts on these resources.

5.5.9 Cultural Resources – Paleontology

Fully Underground LRT Alternative - Little Tokyo Variation 1 involves ground disturbance and, therefore, has the potential to adversely impact paleontological resources within the project area. This disturbance would result from excavations to construct an entirely underground tunnel located east from the 7th Street/Metro Center Station to the intersection of 1st and Alameda Streets and four underground stations. However, implementation of potential

mitigation measures identified in Cultural Resources – Paleontological Technical Memorandum would reduce adverse impacts to paleontological resources to below the level of significance. Therefore, the Fully Underground LRT Alternative - Little Tokyo Variation 1 would not contribute to a cumulative impact on paleontological resources.

5.5.10 Economic and Fiscal

Implementation of mitigation measures identified in the Economic and Fiscal Impacts Technological Memorandum, such as compensation to property owners and business owners, would lessen potential construction impacts. Dependent upon the successful implementation of mitigation where required during construction, some residual impacts could still occur during construction. Given the related projects that could be under construction during the same time as the proposed alternative, construction of the alternative could result in a considerable contribution to cumulative impacts on activity levels and revenue of businesses along the alignment. All other potential economic impacts on property tax, economic output, and employment associated with construction and operation of the alternative would be less than significant and the Fully Underground LRT Alternative – Little Tokyo Variation 1 would not contribute to a cumulative economic impact.

Beneficial economic impacts associated with the Fully Underground LRT Alternative – Little Tokyo Variation 1 include indirect and direct employment growth, with the potential to add 23,500 employees to the area economy; improved accessibility and mobility for the region, which would potentially encourage greater economic activity and benefits for businesses; and employees traveling to and from work.

5.5.11 Safety and Security

Potential cumulative impacts of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be similar to the Underground Emphasis LRT Alternative. From a cumulative perspective, potential impacts associated with the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be mitigated to a less than significant level and would not have a cumulative effect on the safety and security environment in the project area. Please refer to the Safety and Security Technical Memorandum for the Fully Underground LRT Alternative – Little Tokyo Variation 1 potential mitigation measures.

5.5.12 Environmental Justice

The environmental justice analysis treated potential environmental justice impacts to Little Tokyo with special attention given its historical and cultural importance. Although it has shrunk significantly in size, and most of the Japanese-American population has migrated to the suburbs, Little Tokyo remains the historical focal point for Japanese-Americans in the Los Angeles region.

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in the following disproportionate cumulative impacts: loss of parking in Little Tokyo and impacts to community cohesion/viability of Little Tokyo due to parking losses. Implementation of possible mitigation as described in the Environmental Justice Technical Memorandum would reduce the project's contribution to potential disproportionate cumulative impacts to a less than significant level.

5.5.13 Air Quality Impacts and Health Risk Assessment

Operational emissions for the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be less than significant under both CEQA and NEPA thresholds. Regional construction emissions of VOC, NOx, CO, and $PM_{2.5}$ would result in significant air quality impacts under CEQA. Even with required up-to-date (2014 to 2017) equipment during construction as mitigation, regional construction emissions would remain significant and unavoidable.

Although regional construction emissions under the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be significant and unavoidable, operation of the alternative would reduce regional VMT, which would result in a beneficial impact to air quality and outweigh the temporary adverse construction impacts.

5.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

The Fully Underground LRT Alternative - Little Tokyo Variation 2 would connect directly to the tracks at 7th Street/Metro Center Station and continue north underneath Flower Street to 3rd Street and then northeast to 2nd and Hope Streets. Tracks would then proceed east underneath the 2nd Street tunnel and 2nd Street to Central Avenue. Tracks would then veer north beneath the private property bounded by 1st, Alameda, and 2nd Streets and Central Avenue. The tracks would then enter a junction beneath the intersection of 1st and Alameda Streets.

From the junction, the track would diverge into two sets. One set of tracks bound for Azusa would proceed north and rise through a portal just northeast of the intersection of Temple and Alameda Streets. Here, the track would connect to the Metro Gold Line LRT bridge over US 101. Another set of tracks, bound for the San Gabriel Valley, would proceed east from the junction and each rising in a separate portal in the middle of 1st Street between Alameda and Hewitt Streets. These tracks would connect to the existing Metro Gold Line.

Implementation of the Fully Underground LRT Alternative – Little Tokyo Variation 2 is not anticipated to contribute to an adverse cumulative effect related to the following environmental issues: land use; visual or aesthetic resources; water resources; energy resources; GHG emissions; parklands and other community facilities; or growth inducement.

The alignment passes near several potential development sites, and plans for these sites include high density employment and residential facilities. The Fully Underground LRT Alternative – Little Tokyo Variation 2 combined with other projects could also support increases in residential development within the project area which would also be a beneficial land use effect.

Implementation of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in a decrease in highway VMT, which would subsequently result in a net decrease in energy consumption as measured in both BTU's and barrels of oil. This net decrease in BTUs and barrels of oil would result in a beneficial impact to energy resources.

Potential beneficial economic impacts associated with the Fully Underground LRT Alternative – Little Tokyo Variation 2 include improved accessibility and mobility for the region, which would potentially encourage greater economic activity; and beneficial impacts for businesses and employees traveling to and from work.

5.6.1 Transit, Traffic, Circulation, and Parking

During construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2, temporary lane closures and/or street closures, relocation of bus stops, temporary removal of several parking and loading stalls, and temporary sidewalk closures may occur. However, light rail service would be maintained during construction of the alternative. Even with implementation of possible mitigation, construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in significant and unavoidable construction impacts associated with bus transit, traffic circulation, and pedestrian and bicycle movements. Therefore, the alternative could result in a considerable contribution to cumulative construction impacts.

Operation of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would have a less than significant impact on transit systems and parking and, therefore, would not result in a cumulative impact to these resources. This alternative proposes a light rail alignment to provide a link between the 7th Street/Metro Center Station and the Metro Gold Line at 1st and Alameda Streets. This connection would provide a direct east-west route from the vicinity of I-605 and the City of Santa Monica and a direct north-south route between the Cities of Azusa and Long Beach. Consequently, transit patrons could travel from east-west or north-south without having to make a transfer in the downtown area. Additionally, the alternative would result in a significant beneficial impact to regional transit systems compared to the No Build and TSM Alternatives.

With implementation of possible mitigation identified in the Transportation Technical Memorandum, the alternative would not contribute to cumulative impacts associated with other modes of transportation (bicycle and pedestrian facilities).

Under the year 2035 traffic forecasts for the Fully Underground LRT Alternative – Little Tokyo Variation 2, one intersection would be impacted during the AM peak hour and three intersections would be impacted during the PM peak hour. During the PM peak hour, all three intersections would be mitigated to a less than significant level. Therefore, the alternative would not contribute to cumulative impacts at these intersections during the PM peak hour. After implementation of the proposed mitigation measures, significant impacts would remain at one intersection during the AM peak hour. In summary, operation of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in a considerable contribution to significant cumulative impacts at one intersection (Flower Street/ 4th Street) during the AM peak hour. Please refer to the Transportation Technical Memorandum for more information regarding cumulatively impacted intersections.

It should be noted, a number of intersections would improve under the Fully Underground LRT Alternative – Little Tokyo Variation 1 compared to the No Build Alternative by virtue of a reduction in delays. During the AM peak hour four intersections show delay improvements and seven intersections show delay improvements in the PM peak hour. It should also be noted that the inclusion of the Regional Connector would increase the person-carrying capacity through the downtown transportation environment without adversely impacting overall traffic operations.

5.6.2 Displacement and Relocation

Cumulative impacts under the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be similar to those under the Underground Emphasis LRT Alternative. The Fully Underground LRT Alternative – Little Tokyo Variation 2 would greatly enhance non-auto access by rail to downtown and Little Tokyo. This would partly offset some of the loss of parking in the downtown area. Therefore, this alternative would partly self-mitigate cumulative impacts associated with displacement and relocation.

5.6.3 Community and Neighborhoods

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in a beneficial cumulative impact to community mobility, population, housing and employment, and would not contribute to any adverse cumulative effects with respect to viability of existing businesses or emergency services. With implementation of potential mitigation measures identified in the Community and Neighborhood Impacts Technical Memorandum, the alternative would not adversely contribute to cumulative impacts with regards to public health, safety, crime, community resources, or events.

5.6.4 Noise and Vibration

Project-level noise and vibration impacts from operation of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be less than significant. As a result, operation of the alternative would not contribute to cumulative noise or vibration impacts.

Compliance with Section 41.40(a) of the Los Angeles Municipal Code and any variance to the Code would ensure that noise and vibration levels associated with construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would not result in an adverse impact. However, sensitive and/or historic buildings within 21 feet of the construction may be susceptible to vibration damage. Implementation of potential mitigation measures would reduce potentially significant project-level impacts to sensitive or historic buildings within 21 feet of construction to a less than significant level. With implementation of potential mitigation measures identified in the Noise and Vibration Technical Memorandum, construction of the alternative would not contribute to potentially adverse cumulative noise or vibration impacts.

5.6.5 Ecosystems and Biological Resources

Construction activities associated with future projects within the project area have the potential to affect migratory birds if nesting habitat is disturbed during the breeding season. Other ongoing and future construction projects would be required to implement mitigation measures to address any potential impacts to migratory birds under either the Migratory Bird Treaty Act or the California Fish and Game Code. Therefore, there would be no cumulative impacts from the Fully Underground LRT Alternative – Little Tokyo Variation 2 with respect to biological resources.

5.6.6 Geotechnical/Subsurface/Seismic/Hazardous Materials

Cumulative impacts from the Fully Underground LRT Alternative – Little Tokyo Variation 2 could occur if there were a release of hazardous materials during on-going and future projects in the project area that resulted in cumulative impacts to human health or the environment. Compliance with applicable hazardous waste laws and regulations, along with potential mitigation measures identified in the Geotechnical/Subsurface/Seismic/Hazardous Materials Technical Memorandum, would ensure these potential cumulative impacts would be less than significant.

5.6.7 Cultural Resources – Built Environment

Implementation of potential mitigation measures identified in Cultural Resources – Built Environment Technical Memorandum would reduce impacts to historic resources to a less than significant level. Therefore, this alternative would not contribute to cumulative impacts on historic resources. Please refer to the Cultural Resources – Built Environment Technical Memorandum for more detail on specific historic resources.

5.6.8 Cultural Resources – Archaeology

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 has the potential to affect archaeological resources within the APE, including previously unidentified archaeological resources, the Los Angeles zanja system, and sites CA-LAN-3588, P-19-003338,

and P-19-003339. However, implementation of potential mitigation measures identified in Cultural Resources – Archaeology Technical Memorandum would reduce this potential impact to a less than significant level. Therefore, this alternative would not contribute to cumulative impacts on these resources.

5.6.9 Cultural Resources – Paleontology

Fully Underground LRT Alternative - Little Tokyo Variation 2 involves ground disturbance and, therefore, has the potential to adversely impact paleontological resources within the project area. However, implementation of potential mitigation measures identified in Cultural Resources – Paleontology Technical Memorandum would reduce potential adverse impacts to paleontological resources to below the level of significance. Therefore, Fully Underground LRT Alternative - Little Tokyo Variation 2 would not contribute to a cumulative impact on paleontological resources.

5.6.10 Economic and Fiscal

Implementation of mitigation measures identified in the Economic and Fiscal Impacts Technological Memorandum, such as compensation to property owners and business owners, would lessen potential construction impacts. Dependent upon the successful implementation of mitigation where required during construction, some residual impacts could still occur during construction. Given the related projects that could be under construction during the same time as the proposed alternative, construction of the alternative could result in a considerable contribution to cumulative impacts on activity levels and revenue of businesses along the alignment.

All other economic impacts on property tax, economic output, and employment associated with construction and operation of the alternative would be less than significant and the Fully Underground LRT Alternative – Little Tokyo Variation 2 would not contribute to a cumulative economic impact.

Beneficial economic impacts associated with the Fully Underground LRT Alternative – Little Tokyo Variation 2 include indirect and direct employment growth, with the potential to add 25,400 employees to the area economy; improved accessibility and mobility for the region, which would potentially encourage greater economic activity and benefits for businesses; and employees traveling to and from work.

5.6.11 Safety and Security

Potential cumulative impacts of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be similar to the Underground Emphasis LRT Alternative. From a cumulative perspective, potential impacts associated with the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be mitigated to a less than significant level and would not have a cumulative effect on the safety and security environment in the project area.

Please refer to the Safety and Security Technical Memorandum for a description of potential mitigation measures.

5.6.12 Environmental Justice

The environmental justice analysis treated potential environmental justice impacts to Little Tokyo with special attention given its historical and cultural importance. Although it has shrunk significantly in size, and most of the Japanese-American population has migrated to the suburbs, Little Tokyo remains the historical focal point for Japanese-Americans in the Los Angeles region.

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in the following potential disproportionate cumulative impacts: loss of parking in Little Tokyo and impacts to community cohesion/viability of Little Tokyo due to parking losses. Implementation of possible mitigation included in the Environmental Justice Technical Memorandum would reduce the project's contribution to disproportionate cumulative impacts to a less than significant level.

5.6.13 Air Quality Impacts and Health Risk Assessment

Operational emissions for the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be less than significant under both CEQA and NEPA thresholds. Regional construction emissions of VOC, NOx, CO, and $PM_{2.5}$ would result in significant air quality impacts under CEQA. Even with required up-to-date (2014 to 2017) equipment during construction as mitigation, regional construction emissions would remain significant and unavoidable.

Although regional construction emissions under the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be significant and unavoidable, operation of the alternative would reduce regional VMT, which would result in a beneficial impact to air quality and outweigh the temporary adverse construction impacts.

6.0 POTENTIAL MITIGATION MEASURES

Possible mitigation measures that could be implemented to avoid, minimize, or mitigate potentially significant impacts are contained within the specific technical memoranda for each environmental resource.

7.0 CONCLUSIONS

7.1 No Build Alternative

7.1.1 NEPA Findings

The No Build Alternative would not result in adverse direct or indirect impacts related to the following environmental issues: traffic circulation, and parking; land use; displacement and relocation; community and neighborhoods; visual and aesthetic resources; noise and vibration; ecosystems and biological resources; geotechnical, subsurface, seismic hazards, and hazardous materials; water resources; energy resources; greenhouse gas (GHG) emissions; historic resources; archaeological resources; paleontological resources; parklands and other community facilities; Section 4(f) protected resources; economic and fiscal resources; safety and security; growth inducement; or air quality. Therefore, this alternative would not contribute to any adverse cumulative impacts with respect to these environmental resources.

Cumulative transit impacts associated with the No Build Alternative would be adverse as this alternative would not close the gap in the regional rail transit system and would not have the travel time and convenience benefits for transit users associated with the build alternatives. This adverse transit impact would disproportionately affect transit-dependent users who tend to be environmental justice populations based on income and other factors. For transit patrons that have no other travel options, travel times would increase and transit usage would be less convenient. There would be a negative transit impact upon those that rely on the public transit system, for east-west and north-south travel through the downtown area. This would result in an adverse cumulative transit impact.

The No Build Alternative would result in disproportionate impacts associated with transit service equity to minority, low-income communities, but no feasible mitigation (other than construction of one of the build alternatives) exists to minimize this impact. Therefore, the No Build Alternative would result in less-than-significant cumulative disproportionate adverse impacts related to transit service equity.

7.1.2 CEQA Determinations

The No Build Alternative would result in less than significant direct and indirect impacts to all the environmental resources listed above. Therefore, this alternative would not contribute to any significant cumulative impacts with respect to these environmental issues, with the exception of transit systems.

If no significant improvements in transit service are provided in the No Build Alternative, an adverse transit impact would occur to those who rely on the public transit system, for east-

west and north-south travel through the downtown area. This would result in a less-than-significant cumulative transit impact.

7.2 Transportation System Management (TSM) Alternative

7.2.1 NEPA Findings

Implementation of the TSM alternative would not result in adverse direct or indirect impacts related to the following environmental issues: land use; displacement and relocation; community and neighborhoods; visual and aesthetic resources; noise and vibration; ecosystems and biological resources; geotechnical, subsurface, seismic hazards, and hazardous materials; water resources; energy resources; GHG emissions; parklands and other community facilities; Section 4(f) protected resources; economic and fiscal resources; safety and security; and growth inducement. As a result, this alternative would not contribute to adverse cumulative impacts with respect to these environmental resources.

With implementation of mitigation, the TSM Alternative would not result in adverse impacts related to the following environmental issues: transit, traffic, circulation, and parking; historic resources, cultural resources – archaeology; cultural resources – paleontology; environmental justice associated with safety and security. Therefore, this alternative would not contribute to adverse cumulative impacts with respect to these environmental resources.

Cumulative transit impacts associated with the TSM Alternative would be adverse as this alternative would not close the gap in the regional rail transit system and would not have the travel time and convenience benefits for transit users associated with the build alternatives. This adverse transit impact would disproportionately affect transit-dependent users who tend to be environmental justice populations based on income and other factors. For transit patrons that have no other travel options, travel times would increase and transit usage would be less convenient. There would be a negative transit impact upon those that rely on the public transit system, for east-west and north-south travel through the downtown area. This would result in an adverse cumulative transit impact.

The TSM Alternative would result in disproportionate impacts associated with transit service equity to minority, low-income communities, but no feasible mitigation exists (other than construction of either of the two build alternatives) that would minimize the transit service equity impacts. Therefore, the TSM Alternative would result in less-than-significant cumulative disproportionate adverse impacts related to transit service equity.

7.2.2 CEQA Determinations

Implementation of the TSM alternative would not result in significant direct or indirect impacts related to the following environmental issues: land use; displacement and relocation; community and neighborhoods; visual and aesthetic resources; noise and vibration; ecosystems and biological resources; geotechnical, subsurface, seismic hazards, and

hazardous materials; water resources; energy resources; GHG emissions; parklands and other community facilities; Section 4(f) protected resources; economic and fiscal resources; safety and security; and growth inducement. As a result, this alternative would not contribute to cumulative impacts with respect to these environmental issues.

With implementation of mitigation, the TSM Alternative would not result in significant impacts related to the following environmental issues: transit, traffic, circulation, and parking; cultural resources – archaeology; or cultural resources – paleontology. Therefore, this alternative would not contribute to cumulative impacts with respect to these environmental issues.

If no substantial improvements in transit service are provided in the TSM Alternative, an adverse transit impact would occur to those who rely on the public transit system, for east-west and north-south travel through the downtown area. This would result in a less-than-significant cumulative transit impact.

7.3 At-Grade Emphasis LRT Alternative

7.3.1 NEPA Findings

There would be no adverse cumulative impacts from the At-Grade Emphasis LRT Alternative with respect to transit systems, land use; visual or aesthetic resources; noise or vibration associated with project operation; noise during construction; water resources; energy resources; air quality under NEPA; GHG emissions; parklands or other community facilities; Section 4(f) protected parks, recreation areas, or refuges; or growth inducement.

With implementation of project-level mitigation measures, the At-Grade Emphasis LRT Alternative is not anticipated to contribute to any adverse cumulative impacts with respect to the following issues: parking or other modes of transportation; public health, safety, crime, community resources, or events; vibration during construction; ecosystems or biological resources; geotechnical, subsurface, seismic, hazards, or hazardous materials; historic resources; cultural resources – archaeology; cultural resources – paleontology; economic or fiscal resources; safety or security; or environmental justice issues.

With incorporation of possible mitigation, construction of the At-Grade Emphasis LRT Alternative would still result in a considerable contribution to cumulative construction impacts associated with bus transit, traffic circulation, and pedestrian and bicycle movements.

Operation of the At-Grade Emphasis LRT Alternative would result in a considerable contribution to adverse cumulative impacts at 11 intersections during the AM peak hour and 15 intersections during the PM peak hour.

With regards to permanent displacements, operation of the At-Grade Emphasis LRT Alternative would partially offset potential adverse impacts due to loss of parking.

7.3.2 CEQA Determinations

The At-Grade Emphasis LRT Alternative would have no cumulative impact on transit systems, land use; visual or aesthetic resources; noise or vibration associated with project operation; noise during construction; water resources; energy resources; GHG emissions; parklands or other community facilities; Section 4(f) protected parks, recreation areas, or refuges; or growth inducement.

With implementation of project-level mitigation measures, the At-Grade Emphasis LRT Alternative is not anticipated to contribute to any significant cumulative impacts with respect to the following issues: parking or other modes of transportation during operation; public health, safety, crime, community resources, or events; vibration during construction; ecosystems or biological resources; geotechnical, subsurface, seismic, hazards, or hazardous materials; historic resources; cultural resources – archaeology; cultural resources – paleontology; economic or fiscal resources; or safety or security.

With incorporation of possible mitigation, construction of the At-Grade Emphasis LRT Alternative would still result in a considerable contribution to cumulative construction impacts associated with bus transit, traffic circulation, and pedestrian and bicycle movements.

Operation of the At-Grade Emphasis LRT Alternative would result in a considerable contribution to significant cumulative impacts at 11 intersections during the AM peak hour and 15 intersections during the PM peak hour.

With regards to permanent displacements, operation of the At-Grade Emphasis LRT Alternative would partially offset potentially significant impacts due to loss of parking.

Operational emissions for the At-Grade Emphasis LRT Alternative would be less than significant under CEQA thresholds and, therefore, would not result in a cumulative impact. Although regional construction emissions under the At-Grade Emphasis LRT Alternative would be significant and unavoidable, operation of the alternative would reduce regional VMT, which would result in a beneficial impact to air quality and outweigh temporary significant construction impacts.

7.4 Underground Emphasis LRT Alternative

7.4.1 NEPA Findings

There would be no adverse cumulative impacts from the Underground Emphasis LRT Alternative with respect to transit systems, land use; visual or aesthetic resources; noise or

vibration associated with project operation; noise during construction; water resources; energy resources; air quality under NEPA; GHG emissions; parklands or other community facilities; Section 4(f) protected resources; or growth inducement.

With implementation of project-level mitigation measures, the Underground Emphasis LRT Alternative is not anticipated to contribute to any adverse cumulative impacts with respect to the following issues: parking or other modes of transportation; public health, safety, crime, community resources, or events; vibration during construction; ecosystems or biological resources; geotechnical, subsurface, seismic, hazards, or hazardous materials; historic resources; archaeological resources; paleontological resources; economic or fiscal resources; safety or security; or environmental justice issues.

With incorporation of possible mitigation, construction of the Underground Emphasis LRT Alternative would still result in a considerable contribution to cumulative construction impacts associated with bus transit, traffic circulation, and pedestrian and bicycle movements.

Operation of the Underground Emphasis LRT Alternative would result in a considerable contribution to adverse cumulative impacts at two intersections (Alameda Street/2nd Street and Flower Street/4th Street) during the AM peak hour and three intersections (Judge John Aiso Street/1st Street; Alameda Street/2nd Street; and Judge John Aiso Street/Temple Street) during the PM peak hour.

With regards to permanent displacements, operation of the Underground Emphasis LRT Alternative would partially offset potential adverse impacts due to loss of parking.

7.4.2 CEQA Determinations

The Underground Emphasis LRT Alternative would have no cumulative impact on transit systems, land use; visual or aesthetic resources; noise or vibration associated with project operation; noise during construction; water resources; energy resources; GHG emissions; parklands or other community facilities; Section 4(f) protected resources; or growth inducing effects.

With implementation of project-level mitigation measures, the Underground Emphasis LRT Alternative is not anticipated to contribute to any significant cumulative impacts with respect to the following issues: parking or other modes of transportation; public health, safety, crime, community resources, or events; vibration during construction; ecosystems or biological resources; geotechnical, subsurface, seismic, hazards, or hazardous materials; historic resources; cultural resources – archaeology; cultural resources – paleontology; economic or fiscal resources; or safety or security.

With incorporation of possible mitigation, construction of the Underground Emphasis LRT Alternative would still result in a considerable contribution to cumulative construction impacts associated with bus transit, traffic circulation, and pedestrian and bicycle movements.

Operation of the Underground Emphasis LRT Alternative would result in a considerable contribution to significant cumulative impacts at two intersections (Alameda Street/2nd Street and Flower Street/4th Street) during the AM peak hour and three intersections (Judge John Aiso Street/1st Street; Alameda Street/2nd Street; and Judge John Aiso Street/Temple Street) during the PM peak hour.

With regards to permanent displacements, operation of the Underground Emphasis LRT Alternative would partially offset potential significant impacts due to loss of parking.

Operational emissions for the Underground Emphasis LRT Alternative would be less than significant under CEQA thresholds and, therefore, not result in a cumulative impact. Although regional construction emissions under the Underground Emphasis LRT Alternative would be significant and unavoidable, operation of the alternative would reduce regional VMT, which would result in a beneficial impact to air quality and outweigh temporary significant construction impacts.

7.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

7.5.1 NEPA Findings

There would be no adverse cumulative impacts from the Fully Underground LRT Alternative – Little Tokyo Variation 1 with respect to transit systems or parking during operation; land use; visual or aesthetic resources; noise or vibration associated with project operation; noise during construction; water resources; energy resources; air quality under NEPA; GHG emissions; parklands or other community facilities; Section 4(f) protected resources; or growth inducement.

With implementation of project-level mitigation measures, the Fully Underground LRT Alternative – Little Tokyo Variation 1 is not anticipated to contribute to any adverse cumulative impacts with respect to the following issues: other modes of transportation during operation; displacements; public health, safety, crime, community resources, or events; vibration during construction; ecosystems or biological resources; geotechnical, subsurface, seismic, hazards, or hazardous materials; historic resources; archaeological resources; paleontological resources; economic or fiscal resources; safety or security; or environmental justice issues.

With incorporation of possible mitigation, construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would still result in a considerable contribution to

cumulative construction impacts associated with bus transit, traffic circulation, and pedestrian and bicycle movements.

Operation of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in a considerable contribution to an adverse cumulative impact at one intersection (Flower Street/ 4th Street) during the AM peak hour.

7.5.2 CEQA Determinations

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would have no cumulative impact on transit systems or parking during operation; land uses; visual or aesthetic resources; noise or vibration associated with project operation; noise during construction; water resources; energy resources; GHG emissions; parklands or other community facilities; Section 4(f) protected resources; or growth inducement.

With implementation of project-level mitigation measures, the Fully Underground LRT Alternative – Little Tokyo Variation 1 is not anticipated to contribute to any significant cumulative impacts with respect to the following issues: other modes of transportation; displacements; public health, safety, crime, community resources, or events; vibration during construction; ecosystems or biological resources; geotechnical, subsurface, seismic, hazards, or hazardous materials; historic resources; cultural resources – archaeology; cultural resources – paleontology; economic or fiscal resources; or safety or security.

With incorporation of possible mitigation, construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would still result in a considerable construction contribution to cumulative impacts associated with bus transit, traffic circulation, and pedestrian and bicycle movements.

Operation of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in a considerable contribution to a significant cumulative impact at one intersection (Flower Street/ 4th Street) during the AM peak hour.

Operational emissions for the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be less than significant under CEQA thresholds and, therefore, not result in a cumulative impact. Although regional construction emissions under the alternative would be significant and unavoidable, operation of the alternative would reduce regional VMT, which would result in a beneficial impact to air quality and outweigh the temporary significant construction impacts.

7.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

7.6.1 NEPA Findings

There would be no adverse cumulative impacts from the Fully Underground LRT Alternative – Little Tokyo Variation 2 with respect to transit systems or parking during operation; land uses; visual or aesthetic resources; noise or vibration associated with project operation; noise during construction; water resources; energy resources; air quality under NEPA; GHG emissions; parklands or other community facilities; Section 4(f) protected resources; or growth inducement.

With implementation of project-level mitigation measures, the Fully Underground LRT Alternative – Little Tokyo Variation 2 is not anticipated to contribute to any adverse cumulative impacts with respect to the following issues: other modes of transportation during operation; displacements; public health, safety, crime, community resources, or events; vibration during construction; ecosystems or biological resources; geotechnical, subsurface, seismic, hazards, or hazardous materials; historic resources; archaeological resources; paleontological resources; economic or fiscal resources; safety or security; or environmental justice issues.

With incorporation of possible mitigation, construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would still result in a considerable construction contribution to cumulative impacts associated with bus transit, traffic circulation, and pedestrian and bicycle movements.

Operation of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in a considerable contribution to an adverse cumulative impact at one intersection (Flower Street/ 4th Street) during the AM peak hour.

7.6.2 CEQA Determinations

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would have no cumulative impact on transit systems or parking; land use; visual or aesthetic resources; noise or vibration associated with project operation; noise during construction; water resources; energy resources; GHG emissions; parklands or other community facilities; Section 4(f) protected historic resources; or growth inducement.

With implementation of project-level mitigation measures, the Fully Underground LRT Alternative – Little Tokyo Variation 2 is not anticipated to contribute to any significant cumulative impacts with respect to the following issues: other modes of transportation; displacements; public health, safety, crime, community resources, or events; vibration during construction; ecosystems or biological resources; geotechnical, subsurface, seismic, hazards, or hazardous materials; historic resources; cultural resources – archaeology; cultural resources – paleontology; economic or fiscal resources; or safety or security.

With incorporation of possible mitigation, construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would still result in a considerable contribution to cumulative construction impacts associated with bus transit, traffic circulation, and pedestrian and bicycle movements.

Operation of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in a considerable contribution to a significant cumulative impact at one intersection (Flower Street/ 4th Street) during the AM peak hour.

Operational emissions for the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be less than significant under CEQA thresholds and, therefore, not result in a cumulative impact. Although regional construction emissions under the alternative would be significant and unavoidable, operation of the alternative would reduce regional VMT, which would result in a beneficial impact to air quality and outweigh the temporary significant construction impacts.

1.8.7 Local Land Use Policies and Guidelines that Support Transit 1-69
1.9 Potential Transit Markets 1-72
1.9.1 Activity Centers and Destinations 1-72
1.9.2 Local Redevelopment Plans and Transit Improvements 1-75
1.9.3 Air Quality and Environmental Sustainability 1-78
1.9.4 Travel Demand and Patterns 1-79
1.9.5 Summary of Public Travel Markets 1-80
1.10 Goals and Objectives 1-80
1.11 Role of this Alternatives Analysis Study 1-83

Section 2 Alternatives Considered 2-1
2.1 Evaluation Method 2-1
2.1.1 Previous Studies 2-3
2.1.2 Metro/ FTA Scoping 2-3
2.1.3 Screening Criteria 2-3
2.1.4 Screening Criteria Development 2-6
2.2 Alternatives Identified for Initial Screening 2-6
2.3 Result of Initial Screening 2-6
2.4 Short List Alternatives 2-6
2.4.1 No Build Alternative 2-6
2.4.2 Transportation System Management 2-31
2.4.3 At-Grade Emphasis LRT Alternative (Options A and B) 2-37
2.4.4 Underground Emphasis LRT Alternative 2-39
2.4.5 Station Locations 2.55
2.4.5.1 Underground Station on Flower St. 2-55
2.4.5.2 At-Grade Station on Flower St. 2-64
2.4.5.3 Grand Avenue Station 2-65
2.4.5.4 Split Station (City Hall) 2-65
2.4.5.5 Underground Station on 2nd St. 2-66
2.4.5.6 Optional Station on 2nd St. 2-66

Section 3 Transportation Issues and Analysis 3-1
3.1 Introduction 3-1
3.2 Transit Analysis 3-1
3.2.1 Existing Service 3-1
3.2.2 No Build Alternative 3-4
3.2.3 Transportation System Management (TSM) Alternative 3-6
3.2.4 At-Grade Emphasis LRT Alternative 3-7
3.2.5 Underground Emphasis LRT Alternative 3-7
3.2.6 Ridership 3-8
3.3 Roadway Analysis 3-10

3.3.1 Parking Evaluation 3-20
3.4 Summary of Transportation Analysis 3-21
3.5 Conclusions 3-23

Section 4 Affected Environment and Environmental Issues 4-1
4.1 Introduction 4-1
4.2 Land Use and Economic Development 4-1
4.2.1 Affected Environment 4-2
4.2.1.1 Regulatory Framework 4-2
4.2.1.2 Existing Conditions 4-4
4.2.2 Evaluation Methodology 4-7
4.2.3 Environmental Issues 4-7
4.3 Displacement and Relocation of Existing Uses 4-8
4.3.1 Affected Environment 4-8
4.3.1.1 Regulatory Framework 4-8
4.3.1.2 Existing Conditions 4-9
4.3.2 Evaluation Methodology 4-9
4.3.3 Environmental Issues 4-10
4.4 Community and Neighborhood Impacts 4-11
4.4.1 Affected Environment 4-11
4.4.1.1 Existing Conditions 4-11
4.4.1.2 Transit – Relevant Demographic Characteristics 4-13
4.4.2 Evaluation Methodology 4-15
4.4.3 Environmental Issues 4-15
4.5 Visual and Aesthetic Impacts 4-16
4.5.1 Affected Environment 4-16
4.5.1.1 Regulatory Framework 4-16
4.5.1.2 Existing Conditions 4-16
4.5.1.3 Potential Impacts 4-17
4.5.2 Evaluation Methodology 4-22
4.5.3 Environmental Issues 4-22
4.6 Air Quality Impacts 4-24
4.6.1 Affected Environment 4-25
4.6.1.1 Regulatory Framework 4-25
4.6.1.2 Existing Conditions 4-27
4.6.2 Evaluation Methodology 4-28
4.6.3 Environmental Issues 4-28
4.7 Noise and Vibration 4-29
4.7.1 Affected Environment 4-29
4.7.1.1 Regulatory Framework 4-29
4.7.1.2 Existing Conditions 4-30
4.7.2 Evaluation Methodology 4-31

4.7.3 Environmental Issues 4-31
4.8 Ecosystems/Biological Resources 4-33
4.8.1 Affected Environment 4-33
4.8.1.1 Regulatory Framework 4-33
4.8.1.2 Existing Conditions 4-34
4.8.2 Evaluation Methodology 4-35
4.8.3 Environmental Issues 4-35
4.9 Geotechnical: Subsurface and Hazardous Materials 4-35
4.9.1 Affected Environment 4-35
4.9.1.1 Geology and Subsurface Conditions Geologic Features and Soils 4-35

Section 5 Financial Analysis 5-1
5.1 Introduction 5-1
5.1.1 Background 5-2
5.1.2 Status of the Regional Connector Transit Corridor in Existing Long Range Financial Plans 5-2
5.1.3 Description of the Alternatives 5-2
5.2 Capitol Costs 5-6
5.2.1 Capital Costs of the Alternatives 5-6
5.2.2 Year of Expenditure Cost Analysis 5-9
5.3 Potential Capital Revenue Sources 5-12
5.3.1 Conceptually Proposed Funding Sources 5-12
5.3.1.1 Conceptually Proposed Federal Sources 5-12
5.3.1.2 Conceptually Proposed Local/State Funding Sources 5-14
5.3.2 Other Potential Funding Sources 5-16
5.3.2.1 Potential State Source 5-16
5.3.3 Potential Financing Strategies 5-21
5.4 Operations and Maintenance (O & M) Costs and Revenues 5-22
5.4.1 O & M Costs 5-22
5.4.2 O & M Revenue Sources 5-24
5.4.2.1 Farebox Revenues and Farebox Recovery 5-24
5.4.2.2 Operating Support from Metro 2-25
5.5 Summary of Findings 5-25

Section 6 Community Outreach and Public Involvement 6-1
6.1 Understanding of Public Outreach Challenges and Opportunities 6-1
6.1.2 Community Outreach and Public Involvement Program 6-1
6.1.3 Stakeholder Identification and Database Development 6-2
6.2 Public Meetings 6-2
6.2.1 Early Scoping Meetings 6-3
6.2.2 Agency Early Scoping Meetings 6-4
6.2.3 Public Early Scoping Meetings 6-5
6.2.3.1 Overview of Comments Received 6-5
6.3 Community Update Meeting Series #1 6-8
6.3.1 Overview of Comments Received 6-9
6.4 Community Update Meeting Series #2 6-11
6.4.1 Overview of Comments Received 6-11
6.5 Additional Meetings 6-12
6.5.1 Additional Stakeholder Outreach Meetings 6-13
6.5.1.1 Little Tokyo 6-13
6.5.1.2 Bringing Back Broadway 6-14

6.6 Collateral Materials 6-15
6.6.1 Meeting Notices 6-15
6.6.2 Fact Sheets 6-20
6.6.3 FAQs 6-20
6.6.4 Project Website 6-20
6.6.5 Project Information Line 6-20
6.6.6 Media Relations (Print & Broadcast) 6-21
6.6.7 New Media 6-21

Section 7 Comparative Analysis of Alternatives 7-1
7.1 Introduction 7-1
7.2 Approach 7-1
7.3 Goal 1: Support Community Planning Efforts 7-3
7.3.1 Initial Screening Criteria 7-3
7.3.2 Final Screening Criteria 7-5
7.4 Goal 2: Support Public Involvement and Community 7-6
7.4.1 Initial Screening Criteria 7-6
7.4.2 Final Screening Criteria 7-9
7.5 Goal 3: Improve Mobility and Accessibility both Locally and Regionally 7-10
7.5.1 Initial Screening Criteria 7-11
7.5.2 Final Screening Criteria 7-14
7.6 Goal 4: Support Efforts to Improve Environmental Quality 7-16
7.6.1 Initial Screening Criteria 7-16
7.6.2 Final Screening Criteria 7-18
7.7 Goal 5: Provide a Cost Effective Alternative Transportation System 7-19
7.7.1 Initial Screening Criteria 7-19
7.7.2 Final Screening Criteria 7-20
7.8 Goal 6: Achieve a financially Feasible Project 7-21
7.8.1 Initial Screening Criteria` 7-21
7.8.2 Final Screening Criteria 7-22
7.9 Goal 7: Provide a Safe and Secure Alternative Transportation System 7-23
7.9.1 Initial Screening Criteria 7-23
7.9.2 Final Screening Criteria 7-24
7.10 Summary of Recommendations 7-25
7.11 Tradeoffs between Alternatives 7-26

ES.1 Introduction

The Regional Connector Transit Corridor project (Regional Connector) is a vital, core piece of public transit infrastructure that enhances investments already made in the existing Metro Light Rail system. It will link four distinct travel corridors covering over 50 miles across the County through the center of downtown Los Angeles. The Los Angeles County Metropolitan Transportation Authority (Metro) has envisioned this connection for nearly two decades beginning in the late 1980's/early 1990's. At the time of the Metro Rail system's inception, the Long Beach and Pasadena light rail branches were envisioned to meet in downtown Los Angeles and operate as a single line[1]. However, the downtown segment was never built, and passengers now must transfer to the Metro Red Line to move between the two branches as well as reach many major central business district destinations. This solution has functioned acceptably during the Metro Rail system's infancy. However, with the Metro Expo Line to Culver City and Metro Gold Line Eastside Extension opening over the next two years, increasing ridership, increasing traffic congestion, and new major regional developments occurring in downtown Los Angeles, a direct high-capacity link to tie the unconnected regional branches of Metro's light rail system together through downtown is needed.

The proposed Regional Connector would directly link 7th St./Metro Center Station (the Metro Blue Line and Metro Expo Line (2010) terminus) located at 7th and Figueroa Streets, to the Little Tokyo/Arts District Station (a new Metro Gold Line Station opening in 2009) at 1st and Alameda Streets. The project would include several new stations downtown and would allow train operations between Long Beach and Pasadena without the need to transfer. Simultaneously, it would allow train operations between East Los Angeles and Culver City also without the need to transfer. It would also provide passengers with direct trains into the heart of the business and civic districts, whereas the line currently passes along the periphery and then north to Union Station. Metrolink, Amtrak, and Metro Red Line passengers would also have the option to transfer to the Long Beach-Pasadena and East Los Angeles-Culver City trains and reach portions of the downtown area not presently served by Metro Rail. The Regional Connector is a project which provides regional benefits to residents across the County, and can be accomplished with just 1.8 miles of a new set of dual tracks.

Since conclusion of early studies conducted in the early 1990's and even as late as 2004, much has changed in the downtown Los Angeles area, including the availability of right-of-way due to new civic and private developments and the residential explosion created by new development and re-use of historic underutilized buildings. Alternatives previously studied, while mindful of the tight physical and environmental constraints concerning the construction of new infrastructure in a dense urban area like downtown Los Angeles, are no longer applicable. Particularly challenging is the lack of vacant rail rights-of-way for transit vehicles to use, the high traffic pedestrian volumes on streets throughout the project study area (PSA), and the high volume of trains that will funnel into the Regional Connector. New solutions that negotiate these difficulties while maximizing benefits to the regional transit system, provide opportunities for land use improvements, and minimize impingement on the existing street

[1] Pasadena to Los Angeles Project EIR 1988-1993

network have been challenging to develop. Some proposed solutions include splitting the tracks into a couplet to avoid taking two lanes on the same street for rail use, building underpasses to eliminate conflicts between trains and automobiles, and building the tracks underground. The following map (Figure ES-1) shows the PSA and illustrates the present gap in the light rail network.

Figure ES-1 Project Study Area

By linking the 7th St./Metro Center and Little Tokyo/Arts District Stations, Metro will have the ability to provide continuous service across the region in two different directions: east/west and north/south without the need for transfer. The Regional Connector would thus provide a faster, more attractive transit option with greater access to the downtown area and mobility region-wide. The project would make possible the operation plan shown in Figure ES-2. Without it, each of the light rail branches shown would reach only the edge of downtown Los Angeles.

Recognizing the potential benefits to Southern California residents, the Metro Board authorized an Alternatives Analysis (AA) study in July 2007 to explore various technologies and route alignments for the Regional Connector. This report contains the results of that AA study.

Figure ES-2 Anticipated Service Plan

ES.2 Purpose of this Study

The AA is the first phase in the fixed guideway transit project development process defined by Metro and the Federal Transit Administration (FTA) under the New Starts program's Project Planning and Development process. The AA defines a specific transportation need in a corridor, identifies all reasonable alternatives and narrows down the alternatives based on a screening process using evaluation criteria developed during early scoping. The AA provides the reasoning for decisions regarding the identification and narrowing of alternatives. The study is based on evaluation criteria and measures consistent with FTA New Starts guidelines, including costs, benefits, environmental and community impacts and financial feasibility, as well as input from local stakeholders, community members, and public agencies.

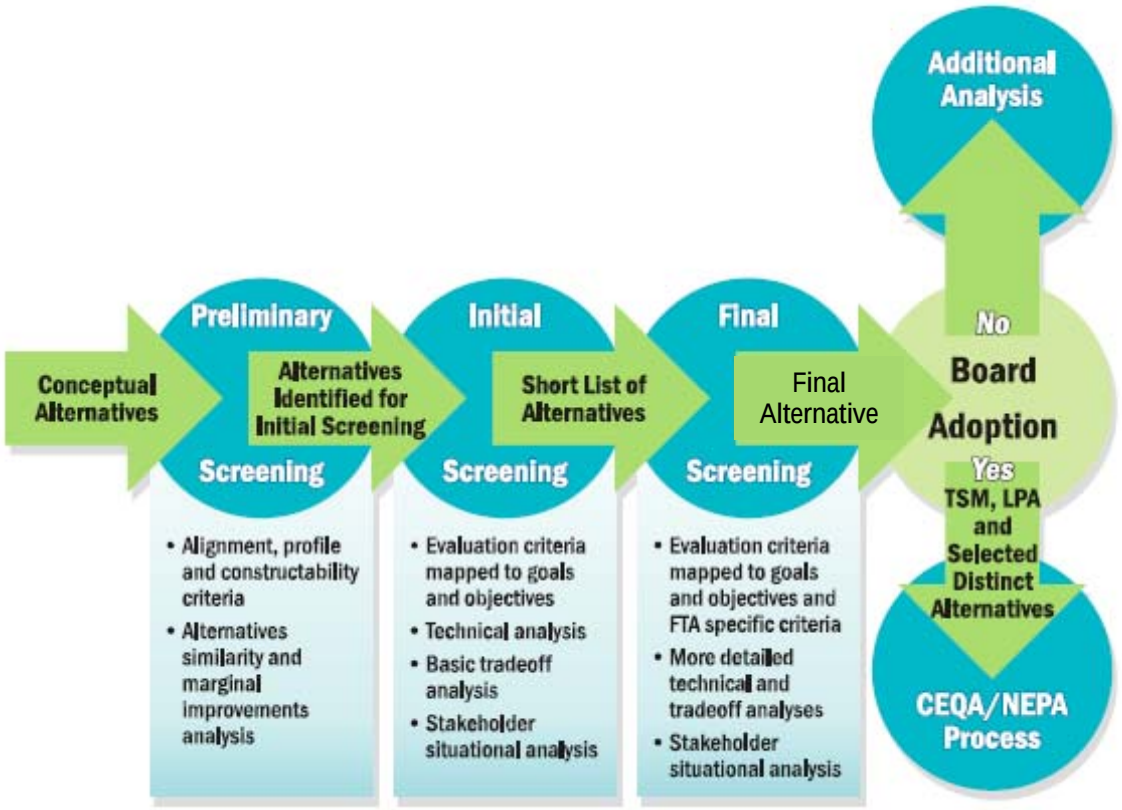

Figure ES-3 Alternatives Analysis Process

Relying on sound assumptions, public input, and initial conceptual engineering, this AA report includes a recommendation to carry a short list of alternatives into the next phase, which includes environmental documentation and clearance per the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA), advanced conceptual engineering, and the selection of a Locally Preferred Alternative (LPA). Upon selection of the LPA and approval from FTA, final environmental documentation and preliminary engineering will be initiated. The process will ultimately lead to a certification of the environmental document, a Record of Decision by FTA, and potential negotiation of a Full Funding Grant Agreement between FTA and Metro. The following diagram (Figure ES-4) shows the AA phase with respect to the entire FTA New Starts process.

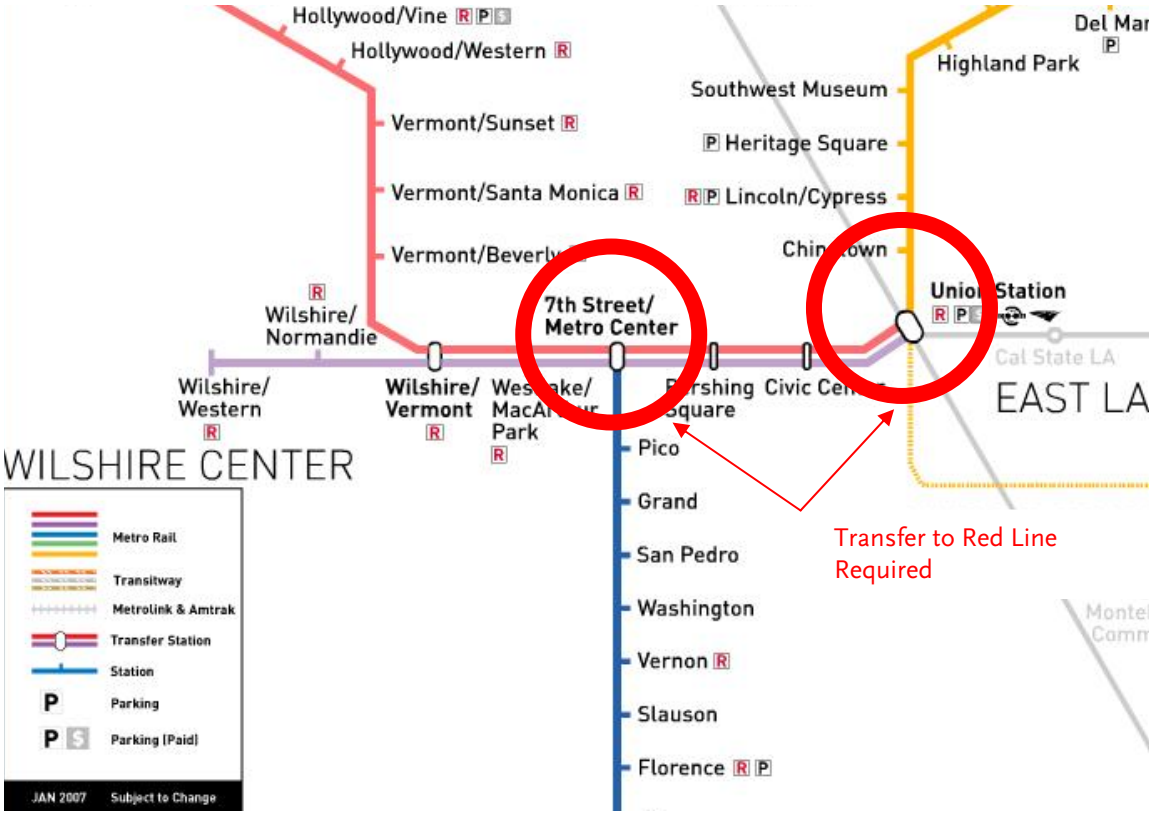
ES.3 Background

The PSA is bounded by the Harbor Freeway (SR-110) on the west, the Santa Ana Freeway (US-101) on the north, Alameda St. on the east, and 7th and 9th Streets on the south. The area presently experiences heavy traffic congestion on weekdays, particularly on the surrounding freeways and the arterial streets leading to freeway on-ramps. Streets in the dense western portion of the PSA (Bunker Hill and the Financial District) routinely experience the highest traffic volumes, with 20,000-30,000 trips per day on some segments of Figueroa and Flower Streets. Though the volumes on these streets are high, the roadways are configured for one-way operation, and are six lanes wide in most places. As such, they accommodate traffic better than some of the narrower streets with lower traffic volumes elsewhere in the PSA. The worst-performing intersection in the PSA, 1st and Alameda Streets, operates at level of service (LOS, a measure of vehicular traffic) F during the morning rush hour, indicating severe congestion. In light of the rapid resurgence of development in the downtown area, traffic conditions are likely to worsen in the absence of improved transit connections to and within the PSA.

Wide roadway on Flower Street near 5th Street, with six automobile traffic lanes and one curb lane of parking. This segment of Flower Street carries about 20,000 cars on a typical weekday.

In the early 1990's, prior to the selection of a finalized rail transit route from downtown Los Angeles to Pasadena, the Los Angeles County Transportation Commission (LACTC, one of Metro's predecessors) studied the continuation of the Metro Blue Line from the existing 7th St./Metro Center Station north to Pasadena. However, LACTC decided to initiate the new light rail service to Pasadena from Union Station, concluding that in the interim riders would be required to transfer to the existing Metro Red Line, which connects Union Station to 7th St./Metro Center Station, until additional funding for a direct connection became available.



Interim solution for connections between the Metro Gold Line and Metro Blue Line selected by LACTC in 1990. Trips involving both the Metro Gold Line and the Metro Blue Line require two transfers.

In 2004, after the Metro Gold Line to Pasadena had opened and construction of the Metro Gold Line Eastside Extension had commenced, Metro initiated studies to revisit the connection between the Metro Gold and Blue Lines. Originally planned as an extension of the heavy rail Metro Red Line that would serve the strong east-west travel demand in the region, the Metro Gold Line Eastside Extension is currently being built as a light rail line to Union Station from East Los Angeles. In addition, the first phase of a new light rail line, the Metro Expo Line, is also being constructed between Culver City and 7th St./Metro Center Station. This first phase is scheduled for completion in 2010. The benefits of having three light rail lines serving four distinct transit corridors connecting through downtown Los Angeles allowing for cross-County trips on a single train prompted Metro to initiate an AA study that would guide the development and funding of the Regional Connector Transit Corridor project.

In June 2008, Metro included the Regional Connector Transit Corridor project in its Draft Long Range Transportation Plan (LRTP) as a rail project in the Tier 1 Unfunded Strategic Plan. At the moment, $160 million has been identified in the recent passage of the half-cent sales tax, Measure R, and additional funding will need to be secured to build and operate the line. This is consistent with Regional Transportation Plan (RTP) which was approved by the Southern California Association of Governments (SCAG) in May 2008.

ES.4 Purpose and Need for Transit Investment

As population, congestion and energy costs increase, there is a need to create mobility options for Los Angeles County. A transportation investment in the PSA will improve mobility, the environment, the economy and the livability for all of Los Angeles County. As the densest business district in the region, the downtown area includes major civic uses, high rise office buildings, the historic core, and multi-billion dollar entertainment venues, all surrounded by four major interstates and state highways operating at poor levels of service. Expansion of the roadway and highway network within the Regional Connector PSA is greatly limited due to the built-out nature of this central business core. The Metro Rail system provides an efficient alternative to driving for people travelling to the downtown area. However, Los Angeles County has several other dense business and activity districts not within downtown Los Angeles. While several of these activity centers are also served by the rail system, many passengers must pass through downtown to reach them.

At present, passengers wishing to travel through downtown Los Angeles on the light rail system must make two transfers, and many Metro Gold and Blue Line passengers need to transfer to the Metro Red Line to reach destinations within the downtown area. Future Metro Gold Line Eastside Extension and Metro Expo Line passengers will face the same delays (up to 20 minutes for transfers in some cases) and contribute to crowding on the Metro Red Line. According to the 2004 Metro Rail Onboard Survey, approximately half of all Gold Line riders used more than one train to complete their trips, suggesting that about 10,000 people are transferring between the Red and Gold Lines each day to travel in the direction of downtown Los Angeles. Ridership on the Metro Gold Line has grown by nearly one-third since 2004, so the number of passengers transferring to the Metro Red and Purple Lines today is likely even higher.

Surveys have not been completed for potential Metro riders of the Metro Gold Line Eastside Extension, the Metro Expo Line and the current riders of the Metro Blue Line. Updated surveys will be completed to determine size of stations and frequency of trains needed for the Regional Connector. A direct connection linking Metro's light rail lines together will allow for more transfer-free trips to be made through downtown Los Angeles from dense residential areas to other employment-rich districts. The following table shows the current and projected year 2030 Metro Rail boardings under No Build conditions.

Table ES-1 Current and Projected Year 2030 No Build Rail Boardings		
Line	Average Weekday Boardings – 2005-06	Projected Average Weekday Boardings - 2030
Metro Light Rail Lines	130,300	189,200
Metro Heavy Rail Lines	125,000	176,500
Total	255,300	365,700

Demographics

According to year 2005 data provided by SCAG, the PSA contains nearly 18,000 people at a density of 11,700 per square mile. However, there are over 168,000 jobs in the same area, at a density of 111,000 per square mile. This formidable imbalance between jobs and housing within the PSA results in heavy inbound commute traffic in the morning and similarly large outbound flows in the afternoon. Accordingly, the PSA records the highest levels of transit ridership in the region, and the existing transit system lifts a significant burden off of the freeways and arterial streets radiating from downtown Los Angeles. Improving the efficiency and speed of the transit system has historically been shown, particularly with the introduction of the Metro Rapid bus system and the existing Metro Rail system, to generate sizeable increases in ridership, especially in areas where the demand for transit service is already high. Additional transportation infrastructure will prove invaluable as the PSA grows. SCAG predicts that the PSA's population will increase by 16.5% and the number of employees will increase by 12% by 2030 (Figure ES-5). This is partly due to dozens of new and adaptive reuse housing developments currently under construction in the area.

Because the Regional Connector is intended to close a gap in the county-wide rail system, it is important to note that Los Angeles County's population is expected to grow to 12.2 million people (22 percent) by 2030, and no freeway expansion projects are planned near the downtown area. Increasing transit capacity and making operations more efficient will be key in allowing the transportation system to accommodate the projected regional growth. Table ES-2 shows the projected growth in both the PSA and Los Angeles County as a whole.

The following maps (Figures S-6 to S-9) show the population and employment distribution within the PSA. The downtown area has a high concentration of both jobs and residences. As the maps show, areas that contain relatively few jobs contain high numbers of residents, and vice versa. As such, nearly all areas of the PSA contain transit supportive land uses. Most of the jobs and residences are within walking distance of either the proposed Regional Connector routes, or the existing Metro Red and Purple lines. As such, the proposed rail network would provide good coverage of most jobs and housing units in downtown Los Angeles, both now and in 2030.

Table ES-2 Population, Household, and Employment Growth			
	2005	2030	Forecast Increase Between 2005-2030

Study Area % of LA County	3.62%	3.34%	---

Source: SCAG, 2005 data and 2030 projections

Of the 18,000 people that currently live in the PSA, most live in the northern portion of Bunker Hill and the area south of Little Tokyo, both of which would have new rail stations in more proximate locations than the existing ones upon implementation of the Regional Connector. There is evidence of concentrated levels of transit dependency in the PSA, since 8,600 of the 9,700 households in the area do not have cars, and 7,200 are classified as low income (average annual salary below $12,755 for a two-person household). Furthermore, children and the elderly are among those most likely to use public transportation because they often lack drivers' licenses and access to private automobiles, and they account for over one-quarter of the PSA's population. As such, a large portion of PSA residents stand to benefit from the new businesses, developments, and amenities in the downtown area, and will augment ridership volumes on the Regional Connector. Like the overall population, low income households are concentrated in the northern portion of Bunker Hill and the southeastern section of the PSA.

Like the PSA, Los Angeles County as a whole is expected to undergo a similar growth spurt over the next two decades. Figures ES-10 through ES-13 illustrate these growth patterns. As shown by the maps, the Metro Rail system passes through many areas with dense employment and residential land uses, including downtown Los Angeles. With large numbers of people within walking distance of the rail lines, the system-wide efficiency gains and better connections between lines generated by the Regional Connector would likely result in substantially increased transit use.

Transportation System

Downtown Los Angeles has the highest concentration of transit service in Los Angeles County. Historic growth patterns have established downtown as the crossroads of the region's transportation system. Ten transit operators provide service to 125 stops in the area along 112 bus routes and three rail lines (four when the Metro Expo Line opens in 2010). Bus service runs in a grid pattern through the downtown area, with the heaviest service on 1st St., the 4th St./5th St. couplet, Hill St., Broadway, the Main St./Spring St. couplet, and the Grand Ave./Olive St. couplet. There is also heavy pedestrian activity throughout the PSA. On the Metro Bus system alone, there are over 90,000 daily boardings within the PSA. Headways, the time between buses or trains on the same line, are as little as two minutes during peak hours on some lines, and there are dozens of express "freeway flyer" style lines that provide added service during peak periods.

The Metro Rail system extends outward from downtown Los Angeles with 73 track miles and 62 stations. Altogether, it logs about 255,000 daily boardings system-wide. Overall, the countywide Metro Bus and Metro Rail systems average 1.6 million boardings each weekday. The busiest routes travel to the areas east and west of downtown, both of which will have expanded light rail service within the next two years. With downtown Los Angeles firmly established as the center of the regional transit network, improved connections and service efficiency in the PSA will reap benefits for transit users throughout Los Angeles County.

The relatively low population compared to the number of jobs in the PSA results in over 70,000 inbound commuters every day, and many more passing through. With such high travel demand in and out of the PSA, all of the freeways entering downtown Los Angeles operate at LOS F during peak hours, indicating severe congestion and delays. Like the PSA, most areas of Los Angeles County are affected by freeway congestion, though traffic volumes in the PSA are among the worst, as evidenced by Figure ES-14.

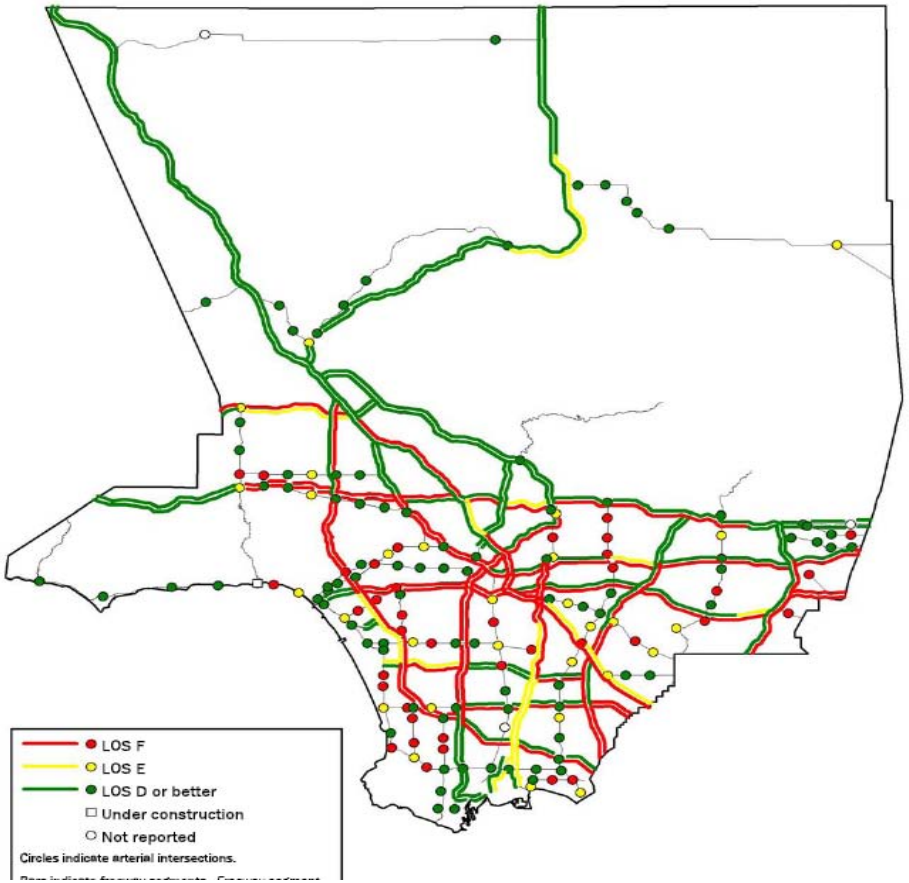
2003 CMP HIGHWAY AND ROADWAY SYSTEM PM PEAK HOUR LEVELS OF SERVICE



2004 Congestion Management Program for Los Angeles County

Figure ES-14 Freeway Levels of Service

Level of Service definitions are provided in Table ES-4. On surface streets, many intersections in the PSA carry upwards of 4,000 vehicles during their busiest hour, with many of these located on Figueroa and Flower Streets. Some of worst LOS ratings occur at some of the narrow intersections along 2nd St., but the only intersection with a rating of LOS F is at 1st and Alameda Streets. By 2030, two additional intersections are expected to deteriorate to LOS F in the absence of one of the Regional Connector build alternatives. The following tables (Tables S-5 and S-6) summarize the levels of service recently observed (2007) in the PSA.

Table ES-4 Level of Service Definitions

Level of Service	Volume/Capacity Ratio	Definition
A	0.000 - 0.600	FREE FLOW. No vehicle waits longer than one red light and no green light phase is fully used.
B	0.601 - 0.700	REASONABLY FREE FLOW. An occasional approach phase is fully utilized; many drivers begin to feel somewhat restricted within groups of vehicles.
C	0.701 - 0.800	STABLE FLOW. Occasionally drivers may have to wait through more than one red light; backups may develop behind turning vehicles.
D	0.801 - 0.900	APPROACHING UNSTABLE FLOW (acceptable for urban conditions). Delays may be substantial during portions of the rush hours, but enough lower volume periods occur to permit clearing of developing lines, preventing excessive backups.
E	0.901 - 1.000	UNSTABLE FLOW (practical capacity). Represents the most vehicles intersection approaches can accommodate; may be long lines of waiting vehicles through several signal cycles.
F	>1.000	FORCED OR BREAKDOWN FLOW. Backups from nearby locations or on cross streets may restrict or prevent movement of vehicles out of the intersection approaches. There are tremendous delays with continuously increasing queue lengths.

Source: Transportation Research Board, *Highway Capacity Manual*, 2000

The high intersection traffic volumes are largely attributable to the PSA's position as a major regional employment hub. Travel demand from all directions is high, especially from the areas east and west of the PSA. Of the relatively few home-based work trips originating in the PSA, most are bound for the Central East, Central West, and West Los Angeles areas. This is further illustrated in the spider diagrams in Figure ES-15 and Figure ES-16:

Table ES-5 Existing (2007) Intersection Level of Service				
	AM Peak Hour		PM Peak Hour	
Intersection	V/C Ratio	LOS	V/C Ratio	LOS

Figure ES-16 Transit Trips from the PSA

Transit-Supportive Land Uses and Activity Centers

In light of the special constraints on roadway expansion and high traffic volumes in the downtown area, several planning entities have included transit-supportive language and projects in their published guidelines and planning documents. The County of Los Angeles, for example, seeks to encourage a range of transportation services for transit dependent populations, support the linking of regional transportation systems, and expand transportation options throughout the county. The Community Redevelopment Agency of the City of Los Angeles (CRA) publishes a set of Downtown Design Guidelines, which call for accessible transportation with an emphasis on walking, biking, and transit, rather than automobiles.

The potential transit markets for the Regional Connector are two-fold: passengers bound for downtown Los Angeles and passengers traveling through downtown Los Angeles on the way to other destinations. As mentioned in previous sections, the project will provide a continuous, transfer-free connection between over 50 miles of light rail lines spanning much of Los Angeles County. In addition, there are many activity centers and major destinations within the PSA that will be more easily accessible from the new Regional Connector stations. Downtown Los Angeles is a primary destination for employment, services, entertainment, and increasingly, housing. The Downtown Center Business Improvement District, which comprises a larger area of the downtown than the PSA, expects 10,000 new residents to move downtown between 2006 and 2009. The continued growth and revitalization of downtown Los Angeles will generate new transit trips both to and within the PSA, heightening the need for increased transit capacity and more efficient operations. Figure ES-17 shows the locations of ongoing development projects in the PSA, all of which will contribute to the activity levels in downtown Los Angeles and heighten the need for additional transit capacity. The figure also provides a photographic representation of the densest areas of downtown Los Angeles.

Major development is expected in the Bunker Hill area, where the proposed Grand Avenue Project will add 3.6 million square feet of new construction, including 449,000 sq. ft. of retail and 2,600 new housing units, nearly doubling the existing total. Similarly, the number of planned and recently completed housing units exceeds 2,000 in Little Tokyo, and planning for new housing is underway at the proposed terminus of the Regional Connector near the Little Tokyo/Arts District Station. The Financial Core is also expected to generate a large number of new trips within the next several years as two projects, Metropolis and Park Fifth, add over 1,000 new residential units and 200 hotel rooms to the PSA. Just south of the PSA, near the Pico Station, the four million square foot entertainment, office, and residential complex, LA Live, will serve as a major attraction that could generate many through-trips on the Regional Connector.

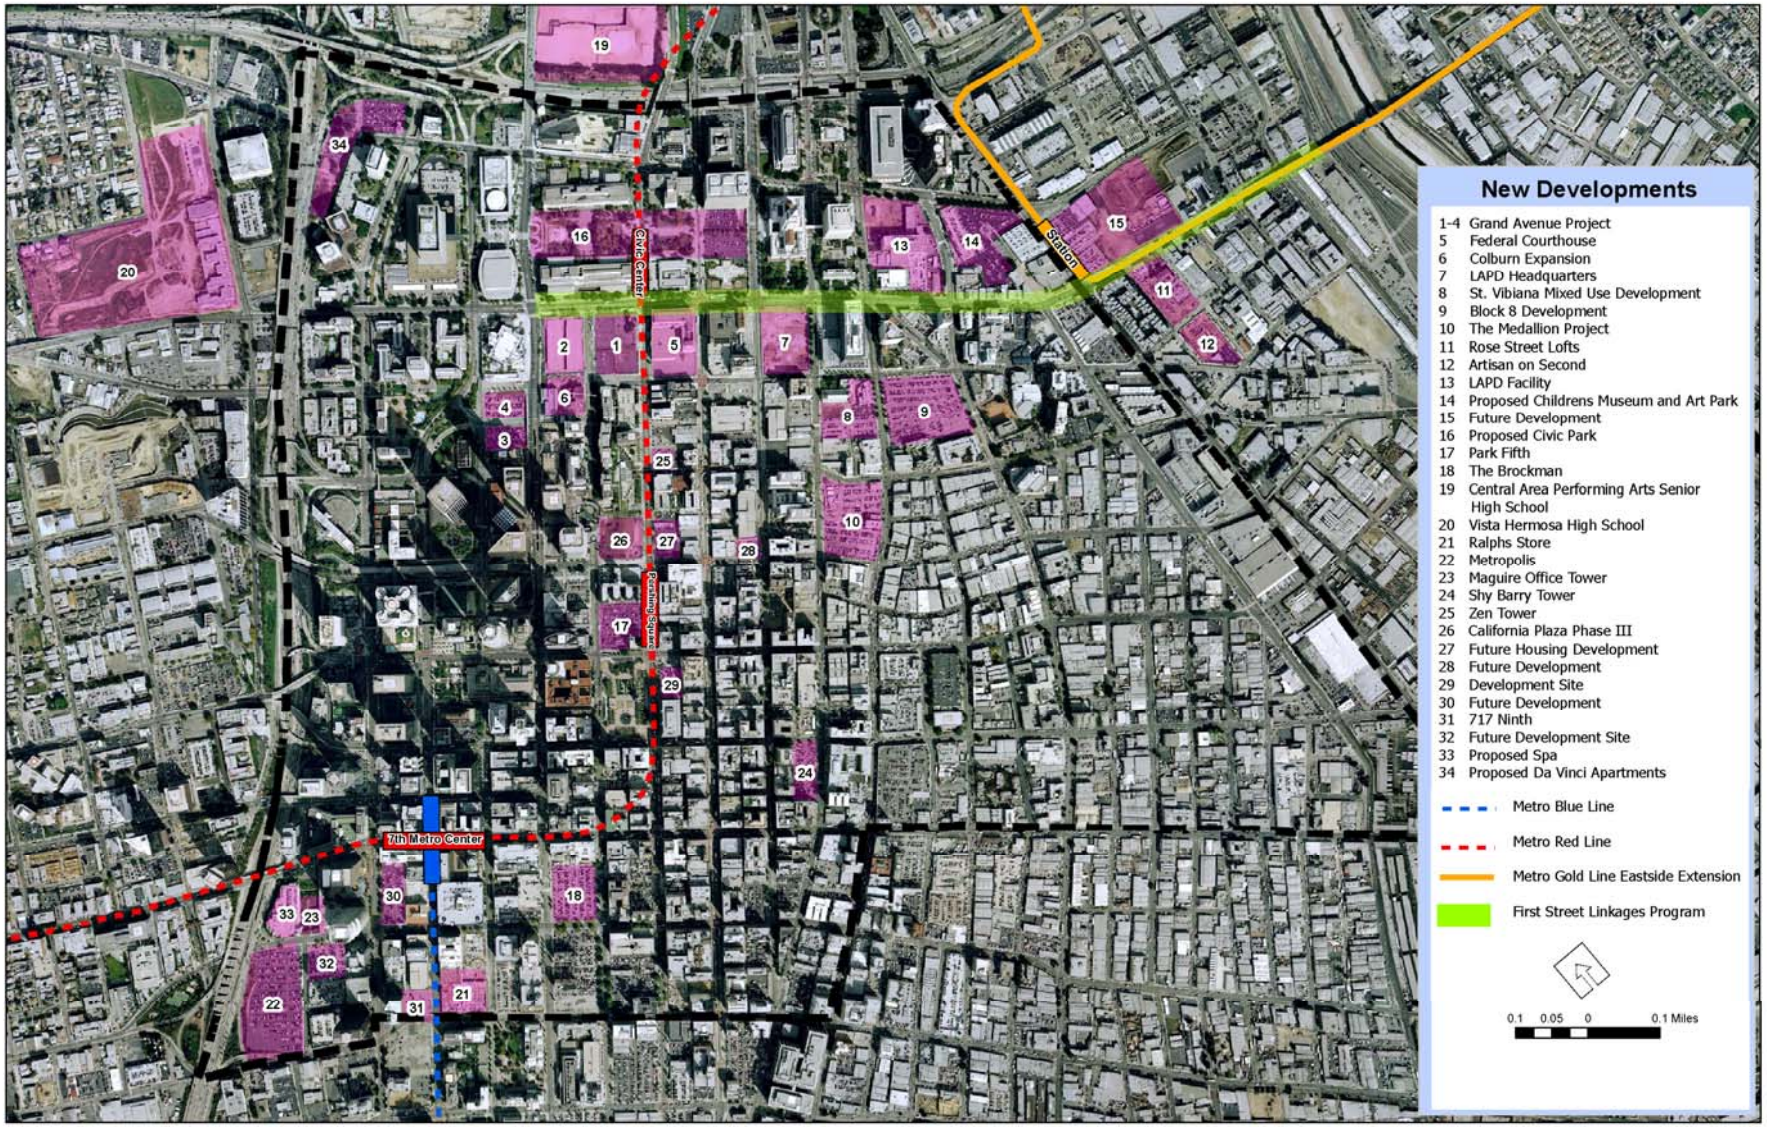

Figure ES-17 New Developments in the PSA

Conclusion

Seamlessly linking all of Metro's light rail lines together will allow for shorter trip times, fewer transfers, better schedule adherence, and more reliable service. All of these benefits are key factors that will improve the transit system's ability to attract high ridership. Los Angeles County has invested over $10 billion in its regional rail system over the past two decades, and the Regional Connector would significantly enhance that investment by improving the operations of the existing system, enabling the system to better accommodate future extensions, and making rail transit more convenient and attractive to potential users. By improving the operation of the entire rail system, the Regional Connector will lure solo drivers from their cars, reduce burdensome passenger loads on the bus network, and improve access to Los Angeles' growing downtown area. In turn, lighter traffic loads on the region's roadways would improve air quality, reduce greenhouse gas emissions, reduce fuel consumption, and represent a step toward a more sustainable transportation system.

ES.5 Community Input Process

In order to ensure that the public was kept informed about the AA study on an ongoing basis and provided with opportunities to comment at key milestones, a detailed Community Outreach and Public Involvement Plan was developed. The Plan included detailed stakeholder identification, communications protocols, public input tracking, a proposed schedule for interfacing with the public and recommendations for how meetings should be conducted at various stages of the study. Additional recommendations for key stakeholder interviews or briefings, inter-agency coordination, topic-specific and other meetings were also included in the Plan. It is important to note that while plans are important, outreach activities, especially on complex projects, were developed to be flexible enough to accommodate changing circumstances and enhanced approaches. Details of this and other outreach efforts can be found in the Community Participation Summary and Report prepared in November 2008.

A series of three public meetings were held respectively in November 2007, February 2008, and October 2008 as part of the ongoing community outreach and public involvement process. The overwhelming majority of comments received supported the need for a Regional Connector to enhance the efficiency of the current and future rail system by providing through service between the Metro Blue Line, Gold Line, Gold Line Eastside Extension and Expo Line, and service to link these rail corridors directly to Union Station. Most comments supported almost equally a Grand Avenue and 1st St. alignment, below-grade (i.e., subway), and utilizing Light Rail Transit (LRT) technology. Several potential stations received wide popularity, including, in order of their level of support, Little Tokyo, 7th St./Metro Center, Bunker Hill, Union Station, Main/1st St. and Civic Center (i.e., in the northern portion of the PSA). No comments were received opposing the Regional Connector, though a few remarks noted that other transit projects may need to receive a higher priority. Many comments specifically pointed out the need to develop a transit system that connects multiple lines, expand the 7th St./Metro Center Station to accommodate enhanced service, and upgrade various operational systems. Of those providing feedback about the evaluation criteria, most thought that access was paramount.

After the initial scoping meetings, a set of two community update meetings was held to present stakeholders with the results of the early scoping process. The majority of those who submitted comments supported a below-grade alignment. There was very little support for an at-grade alignment, particularly in the financial district. There were no concerns expressed about noise and vibration regarding tunneling through downtown Los Angeles. The community expressed interest in identifying ways to minimize transfers between the transit lines, and improved connections to the Metro Red Line.

ES.6 Alternatives Identification and Evaluation Methodology

At the outset of the AA process, Metro considered a wide range of possible modes and alignments to close the gap in the light rail system through downtown Los Angeles. The evaluation and screening process used to compare alternatives is shown in Table ES-8 and described briefly in this section.

At the start of this AA, an initial set of conceptual alternatives to be considered for the Regional Connector was developed by researching previous studies and related reports. Alternatives no longer viable due to changes in the environment were removed from further consideration. Changes in the environment included, but were not limited to, new developments of property previously vacant during the development of an earlier report, changes in land use, and placement of new infrastructure. The initial set of conceptual alternatives was then studied with respect to the following attributes:

- Modes
- Alignments
- Configurations
- Station Locations

Table ES-7 provides a graphic representation of some of the widely-used transit modes and configurations that were considered for the Regional Connector.

During the AA study phase, the project has undergone extensive research and analysis in developing alternatives. This process included:

- Consideration of alternatives previously studied during the 1990's as part of the Los Angeles County Metropolitan Transportation Commission's and Metro's Pasadena Blue Line Project
- Comments received from community involvement activities, including meetings with stakeholders, public agencies, local jurisdiction, and the public during the Initial Scoping phase

- Analysis of the engineering and geographic constraints of building new infrastructure in a dense central business district

- Surveys of land use and travel patterns to determine the most ideal routes and station locations

- Analysis of each alternative's ability to enhance connectivity and reduce transfers within the existing rail system

Based on these attributes, 32 initial conceptual alternatives were identified that would link the 7th St./Metro Center Station and the Metro Gold Line at 1st and Alameda St. (Figure ES-18).

An early scoping process was completed where both the general public and public agencies were engaged and provided input. During this process, goals, objectives and evaluation criteria were developed and documented in the Alternatives Analysis Methodology Report (May 2008). From the early scoping process the following seven goals were established:

Goal 1 Improve Mobility and Accessibility both Locally and Regionally
Develop an efficient and sustainable level of mobility within Los Angeles County to accommodate planned growth and a livable environment.

Goal 2 Provide a Cost Effective Transportation System
Develop a project that provides sufficient regional benefits to justify the investment.

Goal 3 Provide a Safe and Secure Alternative Transportation System
Develop a project that is safe for riders, pedestrians and drivers while meeting the region's need for security.

Goal 4 Achieve a Financially Feasible Project
Develop a project that maximizes opportunity for funding and financing that is financially sustainable.

Goal 5 – Support Public Involvement and Community Preservation
Incorporate the public in the planning process and balance the benefits and impacts while preserving communities in the area, such as Little Tokyo, the Arts District, Bunker Hill, Civic Center and the Historic District.

Goal 6 Support Efforts to Improve Environmental Quality
Develop a project that minimizes environmental impacts.

Goal 7 – Support Community Planning Efforts
Support the progression of the regional center area as an integrated destination and a dynamic and livable area accommodating projected growth in a sustainable manner.

Table ES-7 Modes Considered	
Bus Traditional bus service operates in mixed flow traffic on freeways and arterial streets. Bus service is flexible, easily changed, and has the ability to detour around road obstacles. Service reliability depends heavily on traffic conditions.	
Bus Rapid Transit (BRT) BRT uses buses in exclusive right-of-way or bus-only lanes with traffic signal priority. Exclusive right-of-way could be configured at-grade, underground, or on aerial structures. Buses have the flexibility to leave their right-of-way and detour around road obstacles. Because of the limited use of mixed flow lanes, BRT service quality is less affected by traffic conditions than traditional bus service.	 A BRT bus (Metro Orange Line) operating on dedicated right-of-way in an at-grade configuration
Light Rail Transit (LRT) LRT uses electric trains on conventional rails, powered by overhead wires. Because the power delivery system is overhead, tracks can be installed in mixed flow lanes, exclusive right-of-way with grade crossings, or roadway medians. Automobiles can drive across or along the tracks at grade crossings and on street-running segments. Right-of-way can be at-grade, aerial, or underground. Trains do not have the flexibility to detour around obstacles, and such incidents typically require single tracking and service interruptions. Because of the limited use of mixed flow lanes, LRT service is typically affected little by traffic conditions.	 LRT train (Metro Gold Line) operating in an at-grade configuration

Heavy Rail Transit (HRT)
HRT uses electric trains on conventional rails, powered by a third rail. Because the power delivery system is located at track level, tracks can only run in exclusive right-of-way without grade crossings. Automobiles cannot cross the tracks at all. Right-of-way can be at-grade, aerial, or underground, but at-grade alignments require cross-traffic to use overpasses and underpasses. Trains do not have the flexibility to detour around obstacles, and such incidents typically require single tracking and service interruptions. HRT does not use mixed flow lanes, and service is unaffected by roadway traffic conditions.

HRT train (Purple Line above) operating in an underground configuration

Figure ES-18 Universe of Alternatives Considered

A detailed summary of each of the sub criteria for each of the seven goals is provided in Table ES-8.

The initial set of alternatives was further refined according to the criteria in Table ES-8, and a set of alternatives identified for additional screening was developed. Some of the initial alternatives were developed in 2004 or earlier, and they assumed the use of several then-vacant parcels which now contain new construction or planned developments. These alternatives, along with others where engineering feasibility would have been problematic, were subsequently reconfigured or dropped from consideration. Altogether, a total of eight alternatives were identified with some alternatives having minor variations, as shown in Figure ES-19.

Using the evaluation criteria developed to measure how well each alternative met the goals and objectives for the Regional Connector, the eight alternatives were compared to one another and a final two alternatives, including one alternative having a variation in one station location, were identified. The evaluation took into account level of urban fit, amount of the population served, community acceptability, jobs within a one-quarter mile radius, opportunities for transit-oriented design, number of connections to key activity centers, and other factors pertaining to potential transit benefits. The Initial Screening Report details the routes and configurations of the eight alternatives from which the final two were selected.

ES.7 Alternative Recommendations

Two build alternatives (one with two options) are studied in this AA Report, along with a No Build Alternative and a Transportation System Management (TSM) Alternative, both of which are required by the Federal Transit Administration as part of the New Starts application.

No Build

The No Build Alternative would maintain existing transit service through the year 2030. No new infrastructure would be built, aside from projects currently under construction or identified in Metro's 2008 Long Range Transportation Plan. The rail infrastructure serving the PSA under this alternative is:

- The existing Metro Gold Line from Union Station to Pasadena, a 13.6-mile light rail transit line along the northeastern edge of the PSA.
- The Metro Gold Line Eastside Extension Phase 1 from Union Station to East Los Angeles, a six-mile LRT line scheduled for completion in late 2009.
- The existing Metro Blue Line from 7th St./Metro Center Station to Long Beach, a 22-mile LRT line travelling south from the PSA.
- The Metro Expo Line Phase 1, an 8.5-mile LRT line scheduled to open in 2010, running from 7th St./Metro Center Station to Washington and National Blvds. in Culver City.

Table ES-8 Regional Connector Goals, Objectives, Evaluation Criteria and Performance Measures				
	Goal	Objectives	Initial Screening Criteria (Performance Measures)	Final Screening Criteria (Performance Measures)
1	Support Community Planning Efforts *Support the progression of the regional center area as an integrated destination and a dynamic and livable area accommodating projected growth in a sustainable manner*	• *Support* land use policies and Community Plans	• *Population, Population Density, Households, Household Density for year 2030 ¼ mile of alignment*	• *Number of planned development projects in the area over the next 10 years, including residential/office space/commercial units within a 1/4 mile of stations*
		• Support and coordinate with development and redevelopment efforts	• *Transit Oriented Design supportive plans and policies in place (Score 1 - worst to 5 -best)*	• *Number of connections with sidewalks that support the City's Downtown Street Standards*
		• Support the City's effort to improve urban *design* and the pedestrian environment by contributing to a healthy environment	• *Number of jobs, employment density for year 2030 within a ¼ mile of alignment*	
		• Support efforts to improve safety and *security* for downtown residents, employees and visitors	• *Number of direct connections to key activity centers within ¼ mile of alignment (Score 1 -worst to 5 -best)*	
		• *Support* transit dependent communities	• *Number of opportunities for redevelopment within ¼ mile of alignment (underdeveloped or underutilized properties along alternative alignment)*	
2	Support Public Involvement and Community Preservation	• *Balance* the benefits and impacts to low income and minority communities	• *Evaluation of potential disproportionate effects: Environmental justice effects will be evaluated per CEQA/NEPA requirements (Score 1 to 5)*	• *Number of potential acquisitions*

Goal	**Objectives**	**Initial Screening Criteria (Performance Measures)**	**Final Screening Criteria (Performance Measures)**
Develop a project that is safe for riders, pedestrians, and drivers while meeting the regions needs for security	• Develop direct and indirect safety measures that exceed safety precautions typical of the Metro system • Develop a system that balances the need for accessibility and mobility with security • Develop a system that uses accessibility and mobility as measures for safety and security	• *Number of emergency facilities located within ¼ mile of the alignment, i.e., fire stations, police stations, hospitals.* • *Number of public events within ¼ mile of alignment*	• *Number of events along the alignment* • *Number of potential issues related to accessibility and line of sight for pedestrians and vehicle drivers (Score 1 to 5)*

Figure ES-19 Screened Alternatives

- The existing Metro Red Line from Union Station to North Hollywood and the Metro Purple Line from Union Station to Wilshire/Western Station. Together, these routes comprise a 17.4-mile underground HRT system that presently serves as the sole rail connection between Union Station and 7th St./Metro Center Station. LRT trains are not able to operate on HRT tracks, so the Metro Red and Purple Lines are not suitable for carrying Metro Blue, Gold, or Expo Line trains.

- The 20-mile Metro Green Line runs from Norwalk in southeast Los Angeles County to Redondo Beach, primarily in the center median of the I-105 freeway.

TSM

The TSM Alternative would include the provisions of the No Build Alternative and add two shuttle bus routes to simulate the proposed LRT link between 7th St./Metro Center and Union Station, one along Grand Ave. and 1st St., and one along Figueroa, Flower, 2nd, and 3rd Streets. The shuttle buses would use existing bus-only lanes where available, and would be fitted with transit-priority signalization devices similar to those used on Metro Rapid. The following map, Figure ES-20, shows the two routes. Stops would be located every few blocks so as to provide access to all major destinations along the routes.

Based on analysis of the proposed alternatives and the Regional Connector PSA demographic data during the initial screening process, the list of 32 conceptual build alternatives was narrowed to two preferred build alternatives linking the Metro Gold Line on Alameda between 1st and Commercial Streets to the Metro Blue and Expo Lines' terminus at 7th St./Metro Center Station (Flower and 7th Streets). These build alternatives are described below.

At-Grade Emphasis LRT Alternative

The At-Grade Emphasis LRT Alternative would bridge the gap between the Metro Gold Line and the Metro Blue and Expo Lines using an a combination of at-grade and underground tracks along Temple, Main, Los Angeles, 2nd, and Flower Streets. The route is shown in Figure ES-21.

The new tracks would branch off of the Metro Gold Line Eastside Extension at Temple and Alameda Streets in a wye junction. At this location, a new vehicular underpass for through traffic on Alameda St. would be constructed to remove conflicts between trains and the high volumes of truck and automobile traffic frequently observed at this intersection. A new pedestrian bridge structure over the intersection would also reduce the conflicts between pedestrian and trains, and reduce delays for trains passing through the intersection.

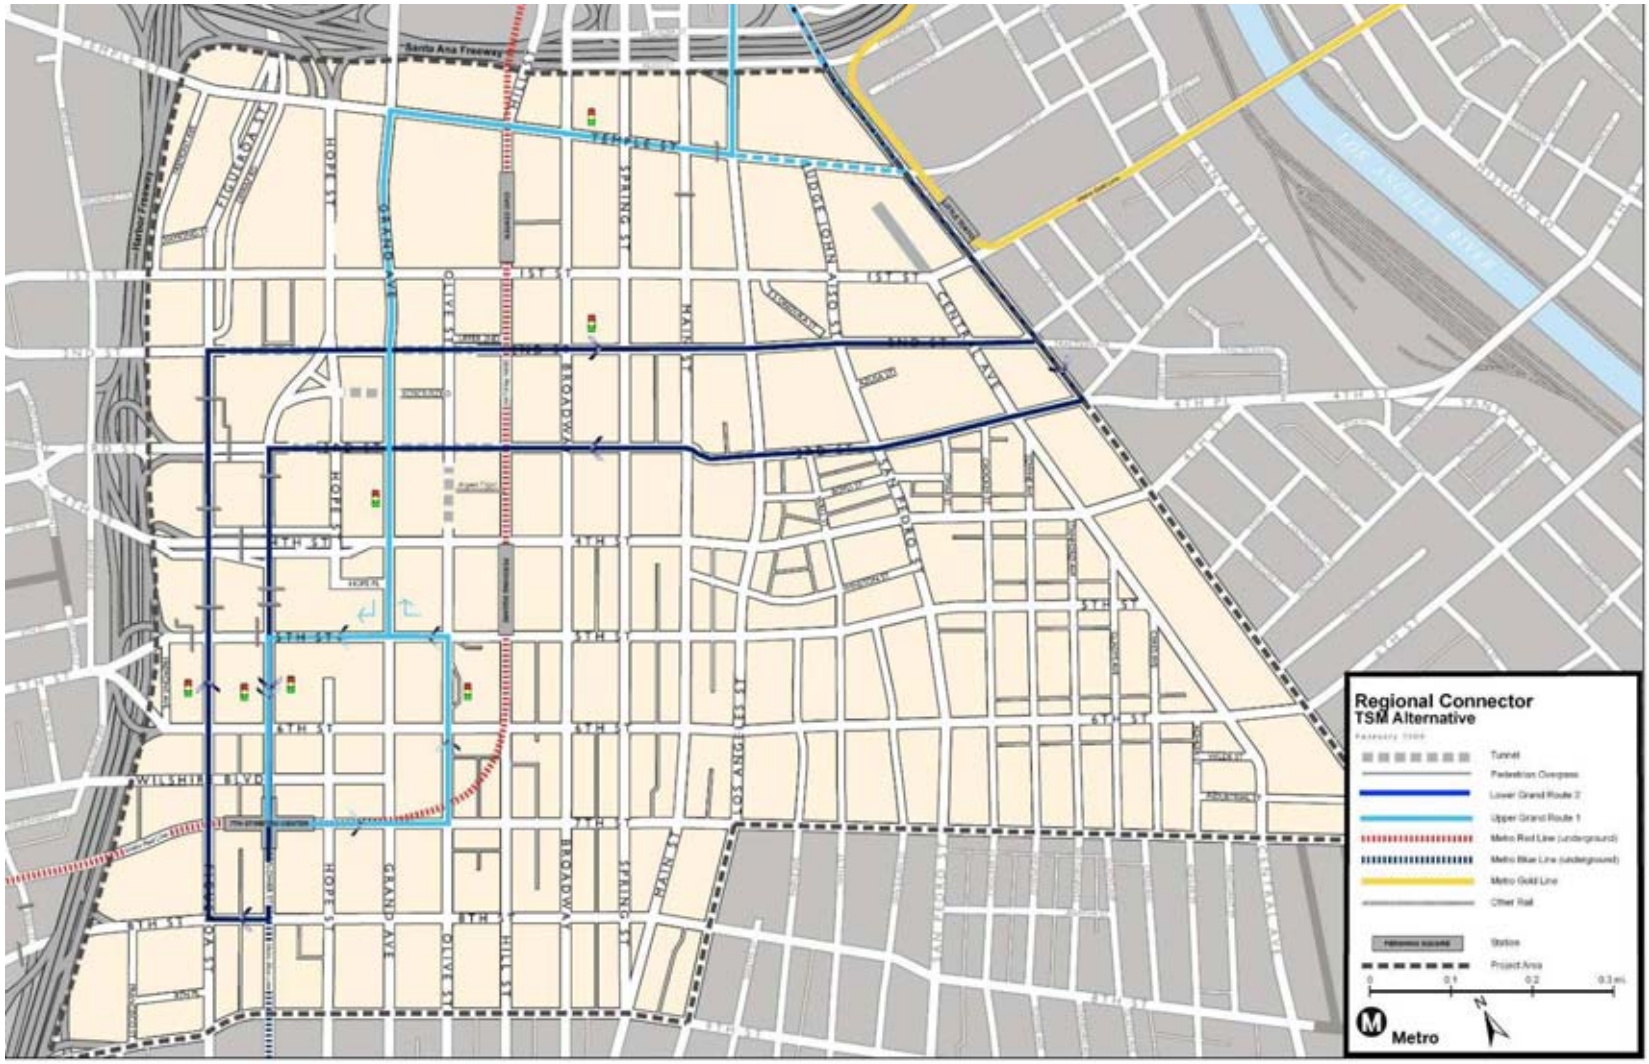

Figure ES-20 Transportation System Management Alternative

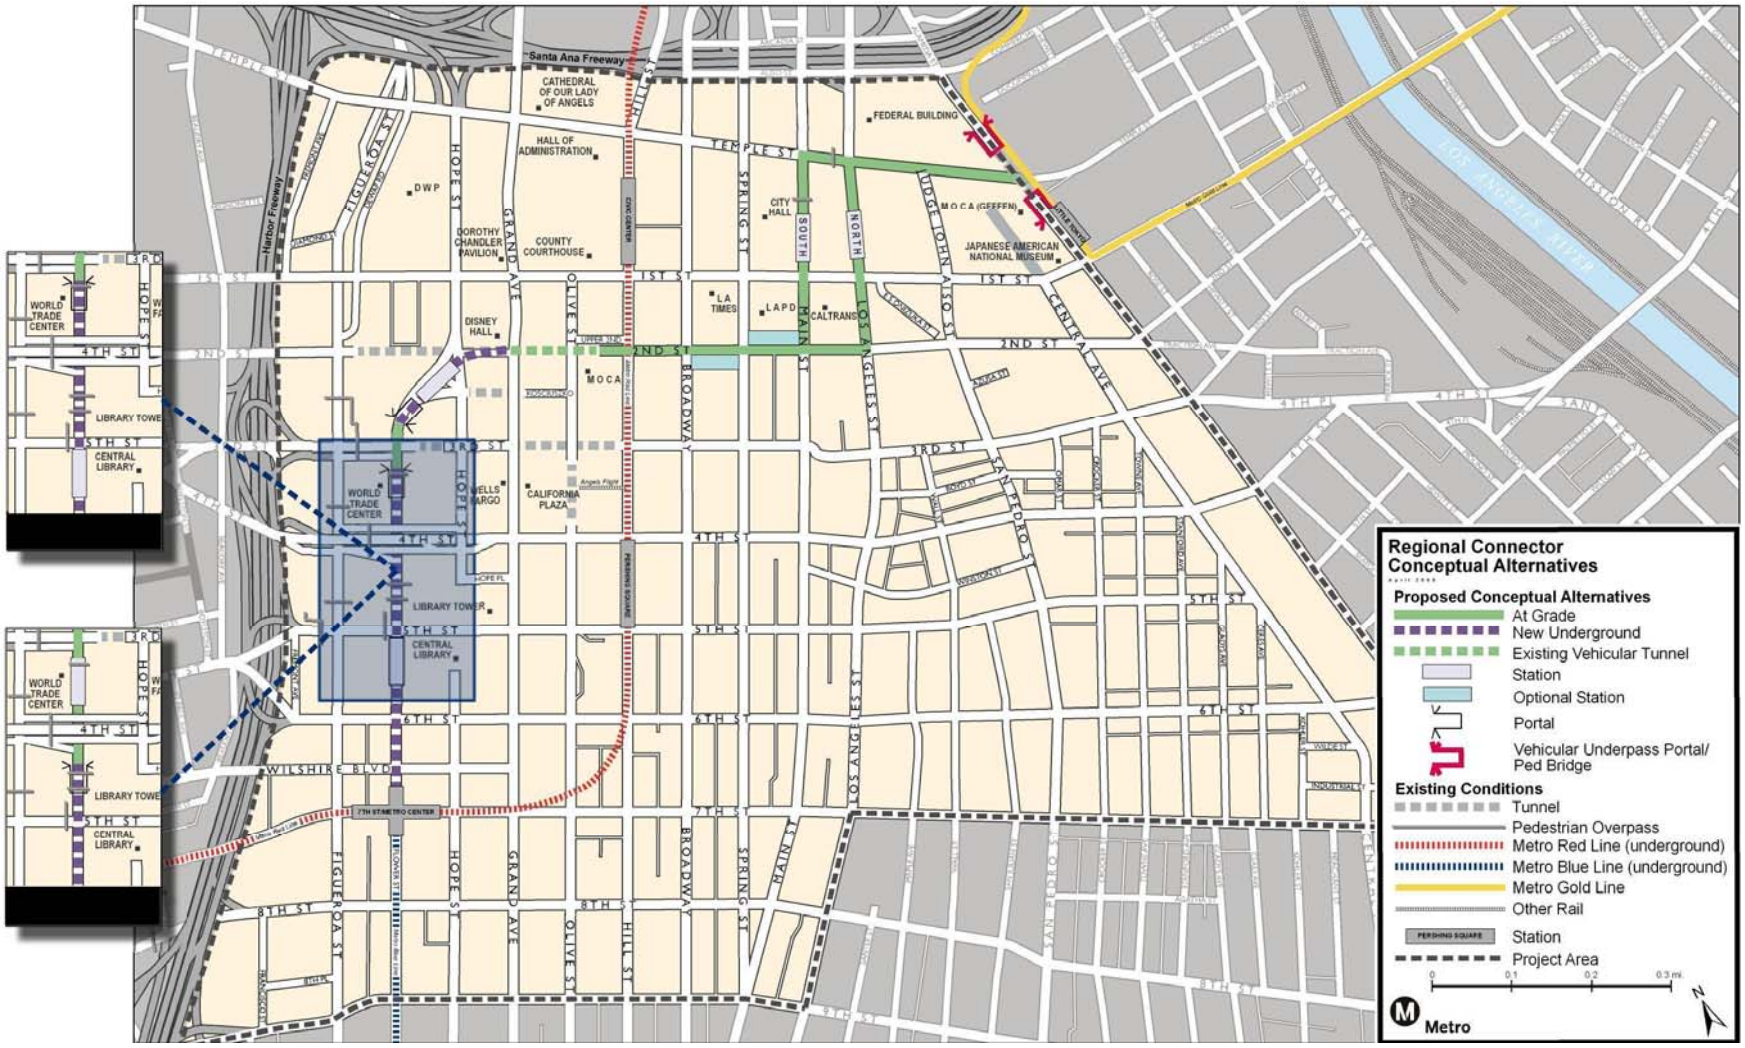

Figure ES-21 At-Grade Emphasis LRT Alternative

Looking Southeast at Temple and Alameda – Before

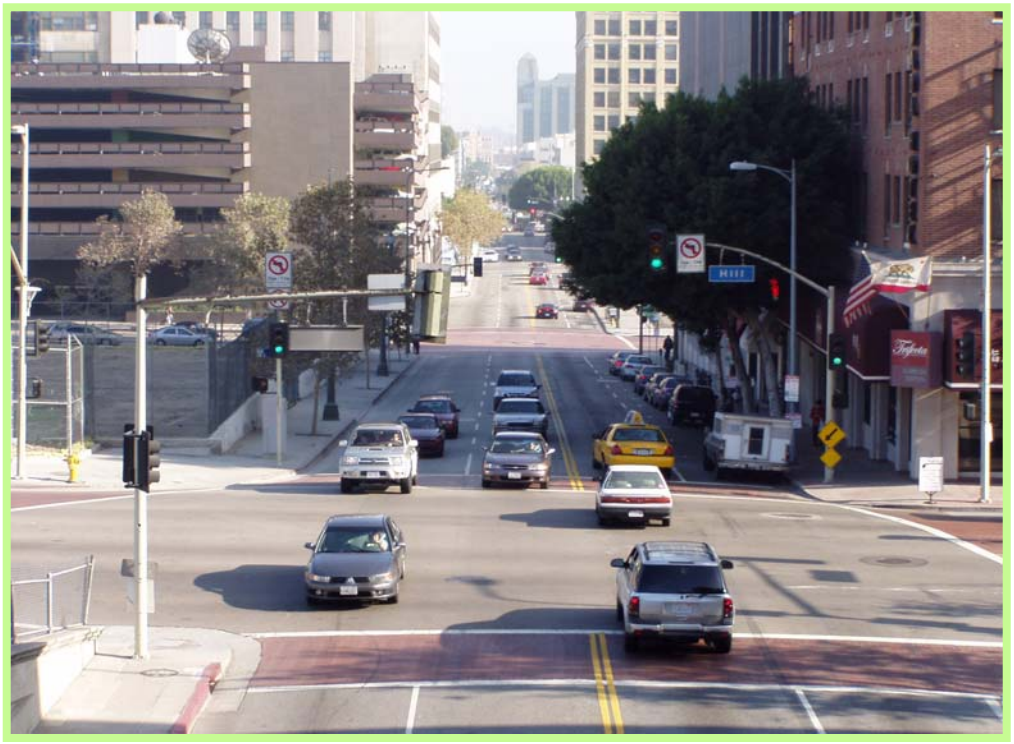
Looking Southeast at Temple and Alameda – After

The tracks would then continue west on Temple St. to Los Angeles St. Here, the tracks would split into a couplet on Main and Los Angeles Streets in order to travel south to 2nd St. Southbound trains would continue west on Temple St. to Main St., then turn south on Main St. to reach 2nd St. Northbound trains from 2nd and Main Streets would go east on 2nd St. and north on Los Angeles St. to rejoin the southbound tracks at Temple and Los Angeles Streets. Both the northbound and southbound tracks would have a new station along the couplet just north of 1st St.

Main St. at Temple, Looking South – Before

Main St. at Temple, Looking South - After

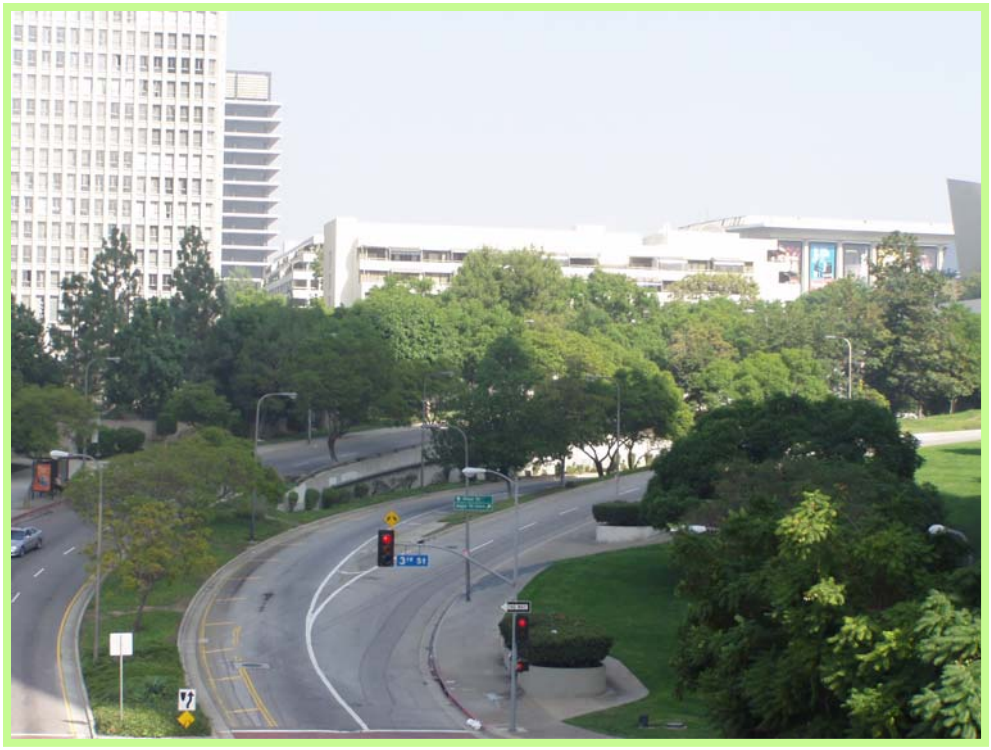
Continuing west along 2nd St. from Main St., there is an option to have a split-platform station in the vicinity of Broadway or Spring St. After crossing Hill St., the trains will enter the existing 2nd St. tunnel and then veer southward into a new tunnel beneath Bunker Hill linking the 2nd St. tunnel with Flower St.



2nd and Hill, Looking East - Before

2nd and Broadway – Looking East - After

There would be an underground station in this tunnel to allow connections with Bunker Hill. Trains would then surface through the hillside on the northeast corner of 3rd and Flower Streets and cross the intersection at-grade to travel southbound in the median of Flower St.



Looking North on Flower Street at 3rd Street – Before

Looking North on Flower Street at 3rd Street – After

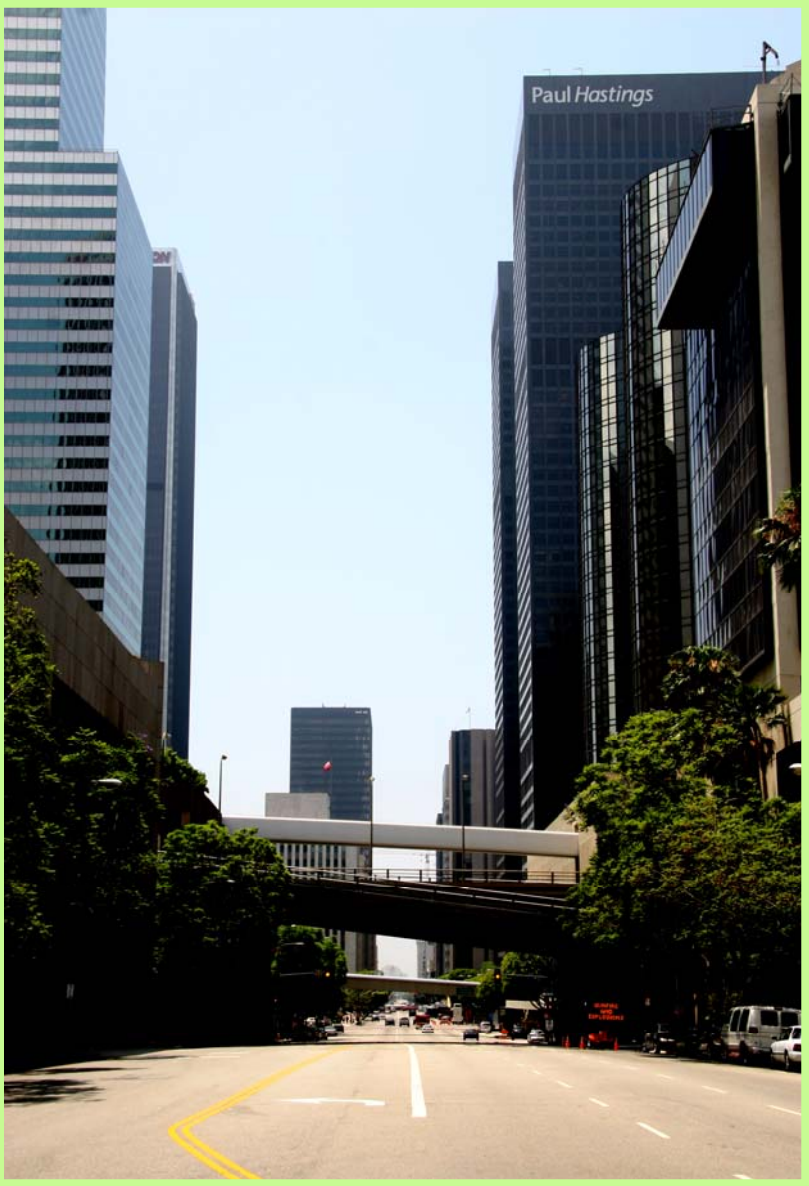
At this point, there are two options for the configuration on Flower St., as described below.

Option A:

After crossing 3rd St., trains would transition to underground tracks and continue south on Flower St. to a new underground station just south of 5th St. From there, trains would proceed underground to 7th St./Metro Center Station and arrive at the existing Metro Blue Line platform.

Option B:

After crossing 3rd St., trains would arrive at an at-grade station in the median of Flower St., just south of 3rd St. From there, trains would continue southward and transition to an underground alignment near 4th St. Trains would then proceed south under Flower St. to 7th St./Metro Center Station and arrive at the existing Metro Blue Line platform.



3rd and Flower, Looking South - Before

3rd and Flower, Looking South - After

Underground Emphasis LRT

The Underground Emphasis LRT Alternative would have a single at-grade crossing at the intersection of 1st and Alameda Streets. The rest of the route would be underground, as shown on the following map (Figure ES-22).

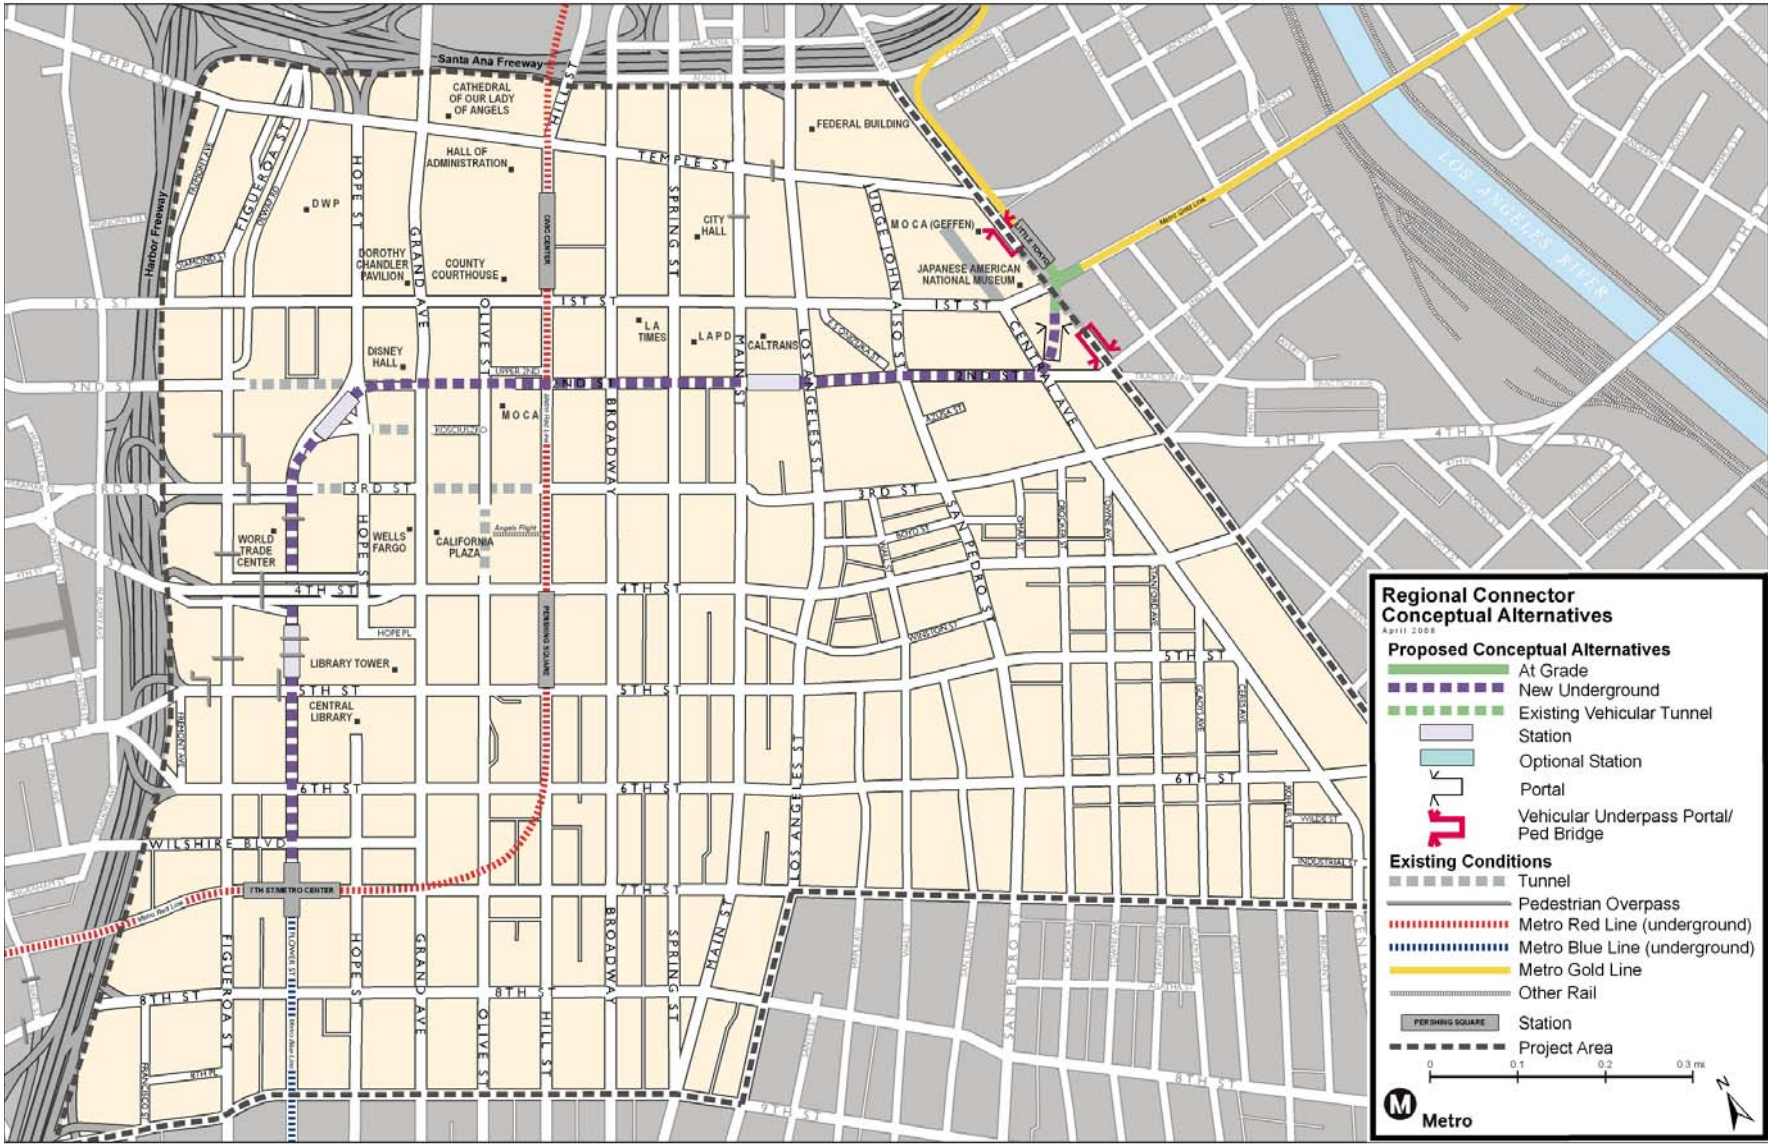


Figure ES-22 Underground Emphasis LRT Alternative

The Underground Emphasis LRT Alternative would branch off from the Metro Gold Line Eastside Extension tracks in a wye junction in the intersection of 1st and Alameda Streets, immediately south of the Little Tokyo/Arts District Station. Trains from East Los Angeles would approach the junction from the east along 1st St, and trains from Pasadena would approach from the north along Alameda St., stopping first at the Little Tokyo/Arts District Station. Both lines would then cross the intersection to reach the southwest corner, where a new tunnel portal would bring the trains underground. At 1st and Alameda Streets, a new underpass would carry car and truck traffic along Alameda St. below the rail junction, and a new overhead pedestrian bridge structure would eliminate most conflicts between pedestrians and trains.

Looking Southwest at 1st and Alameda - After

Once in the tunnel, trains would turn west under 2nd St. to reach a new underground station to be located between Los Angeles St. and Broadway.

2nd and Los Angeles, Looking West - Before

2nd and Los Angeles, Looking West - After

Trains would then proceed west on 2nd St. and turn southward beneath the 2nd St. tunnel. A new station along this stretch of tunnel would provide access to Bunker Hill. After leaving the station, the tunnel would run south underneath Flower St. to reach the next station, just north of 5th St. Trains would then continue south to 7th St./Metro Center Station and arrive on the existing Metro Blue Line platform.

5th and Flower, Looking North - After

ES.8 Transportation Impacts & Benefits

The PSA is currently served by three rail lines and 112 bus lines operated by 10 transit agencies. Service on many of these lines operates very frequently, with vehicles arriving as few as two minutes apart during peak hours. Region-wide commuter rail service (Metrolink) and nationwide passenger rail service (Amtrak) both serve Union Station, just two blocks northeast of the PSA. Two additional LRT extensions, the Metro Gold Line Eastside Extension to East Los Angeles and the Metro Expo Line to Culver City are presently under construction, and are expected to be operational by 2010. The area is also served by several radial freeways branching out toward other major regional destinations, and many of them carry express bus service during peak hours.

Despite the area's dense transportation infrastructure, rapid growth in downtown Los Angeles is overwhelming many of the facilities, including transit transfer stations. Reducing the number of transfers needed to traverse the LRT system would alleviate some of the crowding, particularly at 7th St./Metro Center and Union Station, where two separate portions of the LRT system terminate and many riders must transfer to the HRT Metro Red and Purple Lines to complete their trips. The Regional Connector would improve the link between these two stations and enable transfer-

free service throughout much of the LRT network, most notably from Long Beach to Pasadena along the Metro Blue and Gold Lines, and from East Los Angeles to Culver City along the Metro Gold and Expo Lines.

Alternatives Studied

Because the purpose of the Regional Connector is to bridge a gap in the existing LRT system, LRT is the mode that survived the screening process and is under consideration for the build alternatives. Other modes such as HRT, monorail, commuter rail, people mover, etc. were eliminated due to their high cost and inability to allow single-vehicle service throughout the LRT network. The forecasted effects of the build alternatives (At-Grade Emphasis LRT and Underground Emphasis LRT) were compared with those of the No Build and TSM Alternatives to determine the amount of benefits the new LRT link would provide.

Travel Time Savings

The Regional Connector build alternatives would reduce travel times for many trips on the Metro Rail system whose current headways are shown in Table ES-10. Downtown-bound passengers on the Metro Gold Line would no longer have to transfer to reach their destinations, and Metro Blue and Expo Line passengers could also reach the northern and eastern areas of the central business district without changing trains. Riders passing through downtown from East Los Angeles to Long Beach and Pasadena to Culver City would need to make one less transfer, and riders travelling from East Los Angeles to Culver City and Pasadena to Long Beach would have both of their presently required transfers eliminated.

Under the current Pasadena-Long Beach and East Los Angeles-Culver City operating plan, passengers wishing to travel along the Gold Line from Pasadena to East Los Angeles would need to make one transfer at a new Regional Connector station in order to complete their trips. In the case of the Underground Emphasis LRT Alternative, this would be a cross-platform transfer at the new station on 2nd St. For the At-Grade Emphasis LRT Alternative, the transfer would occur at City Hall, and passengers would need to walk one block from the southbound platform on Main St. to the northbound platform on Los Angeles St.

Tables S-10 and S-11 show the potential time savings for passengers travelling along both of the proposed Regional Connector routes (East Los Angeles to Culver City and Pasadena to Long Beach). These estimates include current travel times along existing lines as well as predicted travel times along the lines that are presently under construction. The No Build estimates reflect a transfer from the Metro Gold Line to the Metro Red and Purple Lines at Union Station, which could take from five to 12 minutes at most times of day. This includes the five-minute ride from Union Station to 7th St./Metro Center Station on the Metro Red and Purple Lines and the transfer from the Metro Red and Purple Lines to the Metro Blue Line at 7th St./Metro Center Station, which could take anywhere from two to twelve minutes. The best case scenario for the No Build Alternative is the same as the predicted travel time along some of the build alternatives. However, it should be noted that the rush hour headways are different on every Metro Rail line serving downtown, as shown in Table ES-9, and the best case scenario under the No Build alternative happens only by chance. Most trips take longer.

Table ES-9 Current Peak Hour Headways on Downtown Metro Rail Lines

Metro Rail Line	Headway
Metro Gold Line	8 minutes
Metro Red and Purple Lines	10 minutes each, 5 minutes combined
Metro Blue Line	5 ½ minutes

Table ES-10 East Los Angeles to Culver City (in minutes)

7th St./Metro Center to Transit Mall	55	55	55	55
Total	96 to 113	96	96	94

*via Metro Red and Purple Lines

Ridership

Model runs predicted the highest overall transit ridership, an increase of 0.7 percent over current levels (about 10,000 new transit trips), for the Underground Emphasis LRT Alternative. This is probably because it bridges the missing link in the LRT system, minimizes transfers, and provides a shorter trip time than the other build alternative. These improvements will increase the attractiveness of the system to people who do not currently ride transit. The rise in the number of rail linked trips is partially offset, however, by a small drop in the number of bus passengers. This indicates that many of the riders attracted to the rail system by the new link will be existing transit riders lured away from buses. However, the increase in rail riders is more than double than the decrease in bus riders, so the majority of the new rail passengers will be new transit users.

Underground-running tracks will eliminate conflicts with surface traffic and allow for faster train speeds.

The At-Grade Emphasis LRT alternative would achieve the same results, but to a slightly lesser extent. Trains would traverse the Regional Connector more slowly because they will need to safely navigate street-running alignments and potentially stop for red lights at intersections. The increase in overall transit ridership would be 0.5 percent, or about 8,000 linked trips.

Trains running at-grade will have to traverse some parts of the At-Grade Emphasis LRT Alternative alignment slowly to navigate 90-degree turns and avoid conflicts with automobiles and pedestrians.

The TSM Alternative would cause overall transit ridership to increase by about 1,000 trips, and cause an additional 1,000 riders to switch from rail to buses. This is likely because the new shuttle buses would provide a convenient new alternative to the Metro Red and Purple Lines for trips entirely within the downtown area, though they would not reduce the number of transfers needed to complete trips into or through downtown.

The No Build Alternative would provide the smallest increase in transit ridership over current levels, since it includes the fewest service improvements. Rail ridership is actually slightly higher under the No Build Alternative than under the TSM Alternative, because there is no competition for riders from the TSM shuttle bus service. Table ES-12 outlines the potential ridership benefits for each alternative in terms of total linked trips system-wide in the year 2030.

Table ES-12 Linked Transit Trip Estimates by Mode

	No Build	TSM	At-Grade Option A	At-Grade Option B	Underground
Bus Linked Trips	1,191,300	1,193,000	1,187,100	1,186,600	1,185,800
Metro Rail Linked Trips	248,200	247,400	260,400	261,700	264,200
Metrolink Linked Trips	76,300	76,400	75,900	75,900	76,000
Total	1,515,800	1,516,800	1,523,400	1,524,200	1,526,000
Increment Over No Build	0	1,000	7,600	8,400	10,200

Roadway Analysis

The traffic impacts of each alternative were compared using volume-to-capacity (V/C) ratio forecasts to identify the predicted amount of congestion. Level of service (LOS) was used to assign degrees of driver comfort to ranges of V/C ratios, with LOS A indicating free-flowing traffic, and LOS F indicating severe congestion. As of 2007, the entire PSA road network was operating at LOS D (acceptable for urban conditions) or better, except the intersection of 1st and Alameda Streets (LOS F) and three roadway segments along 2nd and Alameda Streets (LOS E). Under predicted year 2030 No Build conditions, five additional LOS E and LOS F intersections and nine additional LOS E/F roadway segments were identified. The traffic impacts of the No Build, TSM, and Underground Emphasis LRT Alternatives were found to be minimal and essentially equal, due to their lack of street-running tracks or changes to the road network (Table ES-13).

The At-Grade Emphasis LRT Alternative, on the other hand, would convert traffic lanes, including bus only lanes, along Flower, 2nd, Main, Los Angeles, and Temple Streets to rail rights-of-way, thus reducing the road capacity for automobiles and buses. Numerous turning restrictions would also force additional around-the-block movements and limit access to some parcels. As such, the traffic modeling revealed that roadway congestion in the PSA would increase as a result of the At-Grade Emphasis LRT Alternative (Table ES-14). There would be four additional LOS E/F intersections and two additional LOS E/F roadway segments beyond year 2030 No Build conditions. As a result, this alternative is the least preferable from the standpoint of roadway traffic congestion, and the other alternatives are all equally favorable. Tables S-13 and S-14 show the performance of some roadway segments in the PSA under each of the alternatives. Table ES-15 summarizes the LOS in various intersections in the PSA. The highest number of LOS E and F intersections occur for both Option A and B of the At-Grade Emphasis LRT Alternative.

Parking Evaluation

The number of curb parking spaces that would need to be removed was calculated for both of the build alternatives. Neither the No Build nor the TSM Alternatives would result in the loss of curb parking spaces. The Underground Emphasis LRT Alternative would require the removal of 20 curb parking spaces on the east side of Alameda St. near 1st St. in order to accommodate the new underpass structure. The At-Grade Emphasis LRT Alternative would displace a total of 88 parking spaces. Mitigation measures, such as new off-street parking facilities, may be needed to offset the impact of removing these curb spaces.

Summary

The No Build Alternative would result in the smallest increase in transit ridership over current volumes, and would not address the missing link in the LRT system. However, it would have no negative parking or roadway circulation impacts.

The TSM Alternative would result in a small increase in transit ridership, as well as a redistribution of a small number of passengers from rail to buses. It would augment transit service between both ends of the missing link in the LRT system, but would not eliminate any transfers. Like the No Build alternative, it would have no negative parking or roadway circulation impacts.

The Underground Emphasis LRT Alternative would attract the greatest volume of new riders to the transit system of the alternatives considered, and it would bridge the missing link in the LRT system and allow new, transfer-free service from Long Beach to Pasadena and from East Los Angeles to Culver City. It would have no negative impacts on roadway congestion, but would result in the loss of 20 curb parking spaces.

The At-Grade Emphasis LRT Alternative would attract fewer riders than the Underground Emphasis LRT Alternative because it would operate at lower speeds along the new tracks. It would still bridge the missing link in the LRT system and allow the same transfer-free service between the Metro Blue, Gold, and Expo Lines, but the overall trip times would be longer. The removal of traffic lanes for rail use would increase congestion to severe levels at several locations within the PSA, and would result in the loss of 88 curb parking spaces.

ES.9 Environmental Impacts & Benefits

The challenge of defining a major piece of public transit infrastructure within the urban core of downtown Los Angeles where rail rights-of-way do not exist is making the project fit while not compromising service or the quality of life for the area. The 1.8-mile gap between the operating lines includes major civic, entertainment, historic and cultural districts within a dense, ever-changing, high rise environment. This section summarizes the environmental considerations of the recommended build alternatives. The recommended alternatives will undergo further scoping,

analysis and development leading to circulation of a Draft Environmental Impact Statement/Draft Environmental Impact Report (DEIS/EIR) per NEPA and CEQA in the next phase of this project per authorization by Metro's Board of Directors.

Land Use and Economic Development

The at-grade and underground alternatives follow similar routes through downtown and never stray more than two blocks from each other. The At-Grade Emphasis LRT Alternative could create some additional traffic congestion in the area by removing automobile lanes on 2nd, Main, Temple, and Los Angeles Streets, thus making access to the surrounding businesses by car more difficult. The tracks may also be difficult for pedestrians to traverse, making the area unattractive for walking, especially if existing mid-block crosswalks are removed. However, this impact would be offset by the generation of increased pedestrian trips near the stations.

The Underground Emphasis LRT Alternative would have fewer negative impacts on the existing land-use patterns than the At-Grade Emphasis LRT Alternative because it would not involve removing any existing automobile rights-of-way for rail use. The Underground Emphasis LRT Alternative may also attract more transit trips and business patrons to the area than the At-Grade Emphasis LRT Alternative due to the shorter trip times typically associated with fully grade separated rail.

Displacement and Relocation of Existing Uses

The At-Grade Emphasis LRT Alternative may require reduction of sidewalk widths, and partial or full right-of-way acquisitions at Flower and 3rd Streets (Option A) or Flower and 5th Streets (Option B) where the tracks rise to street level. On Main and Los Angeles Streets, a 5-foot wide strip of land from the existing sidewalk or full or partial right-of-way acquisitions will be needed for station construction. Loss of right-of-way and curb parking is likely along 2nd, Main, Los Angeles, and Temple Streets.

The Underground Emphasis LRT Alternative would require fewer acquisitions, but would necessitate purchasing the entire block bounded by Central Avenue, Alameda Street, 1st Street, and 2nd Street, which is currently occupied entirely by retail and restaurant businesses. Though no residential units are located in this block, the acquisition could still impact local residents due to the loss of some commercial services. No other displacement or loss of curb parking is anticipated.

Community and Neighborhood Impacts

Construction impacts would be temporary, but significant for both of the build alternatives. Noise, vibration, dust, and increased construction vehicle traffic would be necessary during business hours, and road and sidewalk closures could be in effect for months at a time. Both alternatives will have a pedestrian overpass on Alameda St., which will change the appearance of the streetscape.

The At-Grade Emphasis LRT Alternative will significantly alter the character of 2nd, Temple. Main, Los Angeles, and Flower Streets. Twenty-five-foot tall catenary poles would be erected above the street to supply electricity to the trains, and high-platform stations with canopies would be constructed in the roadway medians or along the curb lanes. The street-running tracks could also present new obstructions to pedestrians wishing to cross. Also, the permanent removal of automobile traffic lanes to install tracks and stations may slow both car and bus trips. The removal of left-turn lanes and curb parking spaces would make navigating the area by car more difficult. Metro Rail currently operates from 4 a.m. to 1 a.m. daily, and trains and stations will generate noise in the form of bells, horns, public address announcements, and rail squealing during these times.

The Underground Emphasis LRT Alternative has few surface impacts aside from the placement of station entrances along existing sidewalks. The operational noises may still be heard where the tracks surface at 1st and Alameda Streets, as well as in the vicinity of tunnel ventilation shafts. Noise emanating from the ventilation shafts would be quieter at street level than noise generated along at-grade tracks.

At-grade stations allow pedestrians to move been the sidewalk and the platform quickly without having to navigate stairwells and concourses.

Visual and Aesthetic Impacts

Both alignments will pass within one-quarter mile of over 200 notable architectural resources. The substantial roadway modifications needed during construction will result in potential visual disruption, though the finished infrastructure will be consistent in character with the existing urban landscape. Both alignments will include a pedestrian overpass at Alameda Street, which will impose visual impacts both during and after construction. Platforms, signage, tracks, and overhead wires would be added along PSA streets and sidewalks for the At-Grade Emphasis LRT Alternative, and the wires at some intersections may be numerous enough to produce an overhead web-like effect.

The Underground Emphasis LRT Alternative would add station portals to the PSA, and these would change the appearance of the parcels on which they are located. They would not be tall enough, however, to block views of the surrounding architectural resources. Aside from the portal area at Alameda St., there would be no other visual or aesthetic impacts associated with the Underground Emphasis LRT Alternative. Further study is needed to determine whether the proposed portals would block views of existing public art installations. Though the At-Grade Emphasis LRT Alternative imposes more long-term visual impacts, the Underground Emphasis LRT Alternative would present greater impacts during the construction phase because tunneling takes longer and involves more machinery than installing at-grade tracks.

Air Quality Impacts

Construction-related emissions are expected to be higher for the Underground Emphasis LRT Alternative because it involves significantly more work over a longer period of time than the At-Grade Emphasis LRT Alternative. Changes in intersection configuration, especially under the At-Grade Emphasis LRT Alternative, could cause localized congestion and CO emissions increases. However, on a regional scale, both alternatives would yield fewer vehicle miles traveled (VMT) than the No Build Alternative, and would thus prove beneficial to the region's air quality.

Noise and Vibration

LRT vehicles on both alternatives would generate noise in the form of rail squealing, brakes, propulsion systems, horns, bells, and station platform announcements. The At-Grade Emphasis LRT Alternative may also include crossing bells at street level, and the Underground Emphasis LRT Alternative would have mechanical HVAC systems that could also generate additional noise. The Underground Emphasis LRT Alternative would generate more noise and vibration at track level due to the higher train speeds associated with grade-separated operation, but the amount escaping to the street through the ventilation structures would be minimal and would likely be drowned out by the already-high ambient noise levels in the downtown area. Overall, the At-Grade Emphasis LRT Alternative presents more potential for noise impacts than the Underground Emphasis LRT Alternative, though the magnitude would be similar to bus operations and can be mitigated through careful design and maintenance.

Ecosystems/Biological Resources

There are no protected wildlife areas or waterways within one-quarter mile of the build alternatives. There are also very few locations for vegetation and wildlife to exist in the dense downtown area. As such, the ecosystem impacts of the build alternatives would be minimal. Nesting sites for birds could be affected if construction requires the removal of street trees.

Geotechnical: Subsurface and Hazardous Materials

There are over 500 hazardous materials regulatory database listings located within the PSA, though some sites are listed on multiple databases. There is significant potential for subsurface hazardous materials to be found in the PSA due to the area's long history of commercial and industrial use. The At-Grade Emphasis LRT Alternative would be less likely to encounter these materials than the Underground Emphasis LRT Alternative due to the relatively little tunneling required.

Water Resources

Both build alternatives present relatively low potential for water resources impacts, since the project is not located within one-quarter mile of any major water bodies or flood zones, the downtown area already has very few pervious surfaces, and runoff is monitored and treated before discharge. The Underground Emphasis LRT Alternative is more likely to encounter groundwater during construction because it involves extensive tunneling. Also, the tunneling could open a new pathway for contaminated groundwater to spread quickly. Any dewatering that is needed during construction would be conducted in a manner that does not impact water quality or runoff volumes.

Energy

Both build alternatives would be powered by an overhead catenary system, and the trains' energy requirements would be similar. The Underground Emphasis LRT Alternative's stations would present greater energy needs than the at-grade stations because of the extra lighting, HVAC systems, elevators, and escalators. It would also consume more energy resources during construction due to the complexity of the additional tunneling. Whichever alternative yields the highest volume of new transit riders would impart the greatest reduction in vehicle miles traveled and regional fuel consumption.

Historic, Archaeological & Paleontological Resources

There are hundreds of known historic resources located within one-quarter mile of each build alternative. Because the routes are located close to each other, the lists are largely the same. There are 21 known archeological resources within one-quarter mile of the At-Grade Emphasis LRT Alternative, versus 11 near the Underground Emphasis LRT Alternative. However, construction of the Underground Emphasis LRT Alternative's tunnels is more likely to disturb these known sites as well as unknown sites that may be uncovered. The increased tunneling involved with the Underground Emphasis LRT Alternative also makes it more likely to damage surrounding historic buildings during construction, and the damage may not be detected until years later. The stations and catenary poles needed for the at-grade alignment could alter the character of any historic districts in which they are located, and potentially alter nearby historic buildings if the wires need to be anchored to their exterior walls. Either construction project would need to be conducted in consultation with a qualified architectural historian and archeologist.

Los Angeles' historic City Hall, as seen from the corner of Main and Temple Streets, adjacent to the alignment of the At-Grade Emphasis LRT Alternative.

Parklands and Other Community Facilities

Public transit service generally enhances access to nearby parklands and community facilities. However, the construction of new light rail infrastructure could impede access to facilities located adjacent to the rights-of-way. The list of nearby community facilities and parklands are similar for both build alternatives, and both call for a potential station portal in the vicinity of the Central Library park space. The At-Grade Emphasis LRT Alternative would require restricted vehicle and pedestrian access at certain points along the alignment, which could impede trips to and from community facilities. The grade crossings could also delay emergency vehicles, which may have to wait for trains to pass. The At-Grade Emphasis LRT Alternative also calls for the removal of 88 curb parking spaces, thus reducing ease of access to community facilities for people arriving by car.

Park space outside of Central Library

The Underground Emphasis LRT Alternative would have fewer impacts on access to community facilities via the road network and circulation of emergency vehicles, although the need for more station entrance portals could necessitate placing them in existing park areas.

Economic & Fiscal Impacts

Construction will be temporarily disruptive to economic activity in the PSA, though its effects will be tempered by the creation of temporary construction jobs. These effects are expected to be more pronounced for the At-Grade Emphasis LRT Alternative Couplet A option than for Couplet B or the Underground Emphasis LRT Alternative. For both alternatives, construction could restrict access to nearby businesses and parking facilities, resulting in fewer customers choosing to visit the area. However, many of the businesses in the Civic Center perform government functions, and do not rely on customers being able to reach their offices.

Both build alternatives will require tunneling, and the method used will determine the extent of the surface street closures and associated access restrictions. The Underground Emphasis LRT Alternative will involve more tunneling and the lane closures will be temporary, whereas the At-Grade Emphasis LRT Alternative calls for permanent removal of curb parking and traffic lanes. The Underground Emphasis LRT Alternative will also require more property acquisitions than the At-Grade Emphasis LRT Alternative, and the loss of tax revenue will be higher. However, the loss of tax revenue associated with both alternatives would be of similar magnitude, and is insignificant when compared to the overall tax revenue generated in the PSA. Over time, the new transit service will cause economic activity in the area to increase, and this is expected to be most noticeable for the At-Grade Emphasis LRT Alternative Couplet A option.

Safety and Security

Pedestrian and vehicular traffic volumes are high in the PSA, and there are significant safety concerns associated with adding light rail trains to the area. The At-Grade Emphasis LRT Alternative is particularly susceptible to pedestrian and automobile safety issues due to the open arrangement of the trackway and stations. Pedestrians could easily walk along the tracks and risk being struck by trains. Also, because trains would cross intersections and crosswalks without crossing arms, there would be no physical barriers to keep the trains from colliding with pedestrians or automobiles. Motorist error could cause an automobile to accidentally swerve into the rail right-of-way and collide with a train. The risk of collision increases with the number of pedestrians, trains, automobiles, and train passengers in the area. Pedestrians may also risk being struck by automobiles when using crosswalks to access stations located in roadway medians. Signal phase timing could be adjusted and additional warning devices could be placed at grade crossings to mitigate the safety hazards.

The Underground Emphasis LRT Alternative presents no pedestrian or motorist safety hazards because the tracks would be located underground for nearly the entire length of the alignment and there would be no grade crossings. Pedestrians might still be injured or struck by a train if the platforms become too crowded or if they are not adequately cautious when trains enter the stations. The stations and tracks along the Underground Emphasis LRT Alternative are concealed from view, and it would be difficult for passersby and local law enforcement officers to notice potential security problems. Underground stations and tracks may also create venues for crime, trespassing, and refuge from the elements for non-domiciled persons. One security benefit, however, is that the Underground Emphasis LRT Alternative would not encounter service delays during demonstrations, civil unrest, and public events taking place on the surface.

Potential for Conflicts between Trains, Automobiles, and Pedestrians will Exist at-grade.

Construction Impacts

Intensive construction activity would be needed for both build alternatives. The heaviest construction activities, including tunneling, trenching, sidewalk construction, and roadway refinishing would last for two to three years. Both projects involve tunneling and the installation of at-grade tracks, and construction staging areas will need to be established. During construction, traffic and emergency vehicle circulation could be impeded, and vibration, noise, dust, and localized short-term air pollution could occur. These effects would be felt over a longer period of time for the Underground Emphasis LRT Alternative, since the construction effort would be more complex.

Growth-Inducing Impacts

New transit service does not typically cause growth. It may, however, redistribute the locations of new growth within a region or cause the growth to be more transit-oriented. Downtown Los Angeles already operates as a transit-oriented area and is well-served by the existing transit system, so the Regional Connector is unlikely to spur additional growth in the PSA. However, the addition of more transit stations to the PSA would help nearby development projects attain their goals of having as many patrons as possible arrive by transit. Since the growth-inducing impacts of the Regional Connector would be minimal, there are no significant differences between the effects of the Underground and At-Grade Emphasis LRT Alternative.

Environmental Justice

The demographic characteristics of the areas within one-quarter mile of the two build alternatives are similar, since the two potential routes are located very close together. Year 2000 census data for both alignments reveals that about 80% of the population within the PSA belongs to a minority group, the median annual household income is approximately $15,000-$19,000, 35% live below the poverty threshold, and about 24% are unemployed. The PSA is home to over two dozen homeless shelters and single room occupancy hotels. The large numbers of low-income residents are likely to be benefited by improved transit service, as this group typically demonstrates the highest degree of transit dependency.

In accordance with federal regulations, several community meetings have been held within the PSA to invite public participation and receive comments about the project. During the public input process, issues of transit service equity, disproportionate impacts borne by low-income or minority communities, health impacts, social and economic impacts, neighborhood impacts, noise, vibration, displacement, and construction impacts were considered. One major difference between the two build alternatives is that the At-Grade Emphasis LRT Alternative would bypass the Little Tokyo neighborhood and add a significant amount of new street-running tracks to the Civic Center area. The Underground Emphasis LRT Alternative would travel through Little Tokyo and the Civic Center beneath 2nd St. and transition to at-grade tracks in the block southwest of 1st and Alameda Streets.

Major Utilities

Both build alternatives will involve tunneling under Flower St., where there are large storm drain and gravity lines spanning the entire route from 3rd St. extending south of 7th St. The deepest of these lines is 15 feet below-grade. The location of these large utility lines will make cut-and-cover tunneling difficult. The Underground Emphasis LRT Alternative will face more conflicts with utilities than the At-Grade Emphasis LRT Alternative, especially in the vicinity of stations. Utilities on 2nd St. extend as far at 16 feet underground, and will need to be relocated or bypassed using tunnel boring machines.

ES.10 Financial Analysis

The At-Grade Emphasis LRT Alternative and the Underground Emphasis LRT Alternative are approximately the same length (1.8 miles). The capital costs are estimated to be $795.7 million in year 2008 dollars for the At-Grade Emphasis LRT Option A, $709.3 million for Option B and $910.4 million for the Underground Emphasis LRT Alternative. The shuttle bus TSM Alternative would cost $62.7 million (Table ES-16).

Table ES-16 Capital Costs of Each Alternative (in millions of dollars)

Alternative	2008 Dollars
No Build	$0.00
TSM	$62.74
At-Grade Emphasis LRT Alternative – Option A	$795.67
At-Grade Emphasis LRT Alternative – Option B	$709.30
Underground Emphasis LRT Alternative	$910.36

For all of the build alternatives, about 62 percent of the capital costs will go toward construction. Two to seven percent would pay for new light rail vehicles, about 21 percent would pay for professional services, and nine percent would be reserved for unallocated contingencies.

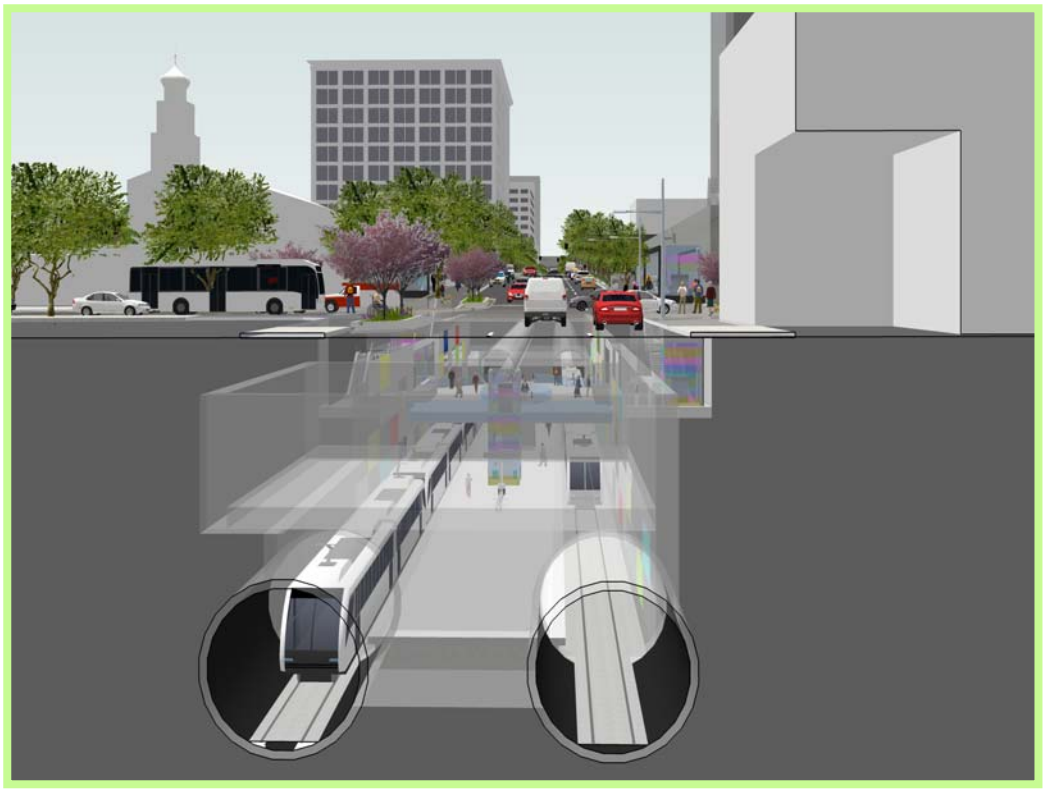
The potential funding sources assume 50 percent local funding through transportation sales taxes, benefit assessment districts, and Mello-Roos community facilities districts. Potentially, local congestion pricing revenues and transportation impact mitigation fees may also be used. The strategies also call for at least 50 percent federal funding through the New Starts program, and in the case of the TSM Alternative, the Section 5309 Bus Discretionary Program. Federal Congestion Management and Air Quality Program (CMAQ) funds could potentially be used to finance the Regional Connector, as the project will be capable of reducing congestion and thereby improving air quality. On the state level, a potential source of funding is the California High-Speed Rail Project, which will offer money to connect existing regional rail services to the new project should it be constructed.

ES.11 Issues to be Resolved

Upon Metro Board Authorization, environmental analysis and continued engineering will support further identification and resolution of project challenges. The following lists current identified issues and the need for further study for both of the alternatives.

- Metro will continue to review safety and security considerations in order to make the Regional Connector a reliable, safe, and secure system for pedestrians, riders, autos, and bicyclists.
- Traffic conditions for the At-Grade Emphasis LRT Alternative will continue to be evaluated during the environmental process in close collaboration with LADOT. The use of the 2nd St., including the 2nd St. tunnel, for LRT operations would transform the roadway into a transit mall. This would mean fewer autos, but not necessarily fewer people, using 2nd St. Street. Parking would be removed in this location, but possibly replaced nearby. An additional station on 2nd St. will be analyzed for potential benefits.
- Construction methods will continue to be evaluated for safety, expediency, and impacts on the environment.
- The environmental process will be completed (Environmental Impact Statement/Environmental Impact Report) based on NEPA and CEQA guidelines.
- Approval from the California Public Utilities Commission will be sought for the proposed grade crossings.
- Further engineering will be undertaken to develop detailed estimates of costs, environmental impacts, utility relocation needs, and potential mitigation measures.
- Station entrance locations will be evaluated based on how well certain locations perform in terms of attracting riders, visibility, close proximity to activity centers, and impacts to surrounding properties.
- Station construction and construction staging will be described in more detail during the environmental process.
- Property impacts will be identified.

2nd and San Pedro Streets, looking west - Before



2nd and San Pedro Streets, Looking West – After (Underground Emphasis LRT Alternative)

ES.12 Conclusion

Metro has completed this AA Study in a collaborative effort with the community to determine the need and benefit of linking three rail lines serving the region, to identify alternatives and evaluate which alternatives achieve certain goals and criteria, and to provide the Metro Board of Directors the information needed to select alternatives to be further engineered and analyzed in a Draft Environmental Impact Statement/Draft Environmental Impact Report per NEPA and CEQA. The engineering and environmental analysis for Board selected alternatives will also be used to prepare documents and submission consistent with the requirements of project pursuing FTA New Starts funding, including the request for authorization from the FTA to initiate preliminary engineering.

The following Table ES-17 provides a quick glance summary comparison of the potential alternatives based on the AA analysis.

Table ES-17 Summary Comparison of Alternatives

Alternative	Transportation	Environment	Cost/Public Support
No Build	No additional transportation benefits beyond Metro's Long Range Transportation Plan	No project would be constructed	No capital costs, and no additional operating costs
Transportation System Management (TSM)	- Smallest increase in transit trips (1,000 daily) - No reduction in transfers for rail users - Greatest travel time - Most stops along route	- No parking impacts outside of peak hours, no reduced roadway capacity - Overall fewer impacts than build alternatives - No property acquisitions needed	- Little public support expressed - Lowest capital cost ($63 million) - Greatest annual operating costs ($13.6 million) - Highest cost per hour of user benefit ($97)
At-Grade Emphasis LRT	- Increase in transit trips (7,600-8,400 daily) - Eliminates up to two transfers for some rail trips - Improved travel time from Union Station to 7th St./Metro Center over No Build and TSM (12 minutes)	- Parking impacts and reduced roadway capacity along segments of Flower, 2nd, Main, Los Angeles, and Temple Streets. - Greatest visual and noise impacts - Most alterations to existing streets - Most property acquisitions	- Public concerns over grade crossings and loss of parking - Capital costs range from $709-$796 million - Moderate annual operating costs ($9.6-9.8 million) - Cost per hour of user benefit ranges from $20-25
Underground Emphasis LRT	- Largest increase in transit trips (10,200 daily) - Eliminates up to two transfers for some rail trips - Shortest travel time from Union Station to 7th St./Metro Center (10 minutes)	- Parking impacts and reduced roadway capacity at intersection of 1st and Alameda only - Fewer visual and noise impacts than At-Grade Alternative - Fewer alterations to existing streets than At-Grade Alternative - Fewest property acquisitions of the build alternatives	- Strongest public support, concerns over 1st and Alameda crossing - Highest capital cost ($910 million) - Lowest annual operating costs ($5.2 million) - Lowest cost per hour of user benefit ($19)

Section 1 Purpose and Need

1.1 Introduction

This report describes the purpose and need for transportation investments in the Regional Connector Project Study Area (PSA). The Regional Connector is a transit project planned by the Los Angeles County Metropolitan Transportation Authority (Metro) to provide more convenient transfers between Metro Rail Lines, dozens of bus lines, and regional commuter rail service for passengers traveling to, from, and through downtown Los Angeles.

There are currently no direct trains for Metro Blue Line light rail passengers from Long Beach travelling to the Metro Gold Line to Pasadena, or vice-versa. These passengers must transfer through the Metro Red or Purple Lines and travel between 7th St./Metro Center Station and Union Station for the connection. When the Metro Expo Line from 7th St./Metro Center Station to Washington/National Station in Culver City opens in 2010, its riders will also need to transfer at 7th St./Metro Center Station and Union Station to reach the Gold Line. The Regional Connector would extend the shared Metro Blue/Expo Line tracks from their present terminus at 7th St./Metro Center Station to a junction with the Metro Gold Line near the Little Tokyo/Arts District Station with continuing service to Union Station and beyond. This would provide a one-seat ride for Metro Blue Line passengers travelling from Long Beach to Pasadena. Metro Expo Line passengers would also be able to ride from Washington/National Station in Culver City to East Los Angeles without transferring, via the Regional Connector and the Metro Gold Line Eastside Extension.

The Regional Connector would also provide increased transit coverage of the Civic Center, Bunker Hill, Historic Core, Little Tokyo, and Financial Core as it travels between 7th St./Metro Center Station and the Metro Gold Line.

See Figure 1-1 for a map of the PSA and Figure 1-2 for an overview map of the Metro Rail system.

This Alternatives Analysis (AA) presents an evaluation of alignments, modes, configurations, and station locations under consideration for the Regional Connector. The alternatives are then screened based on defined criteria to identify preferred alternatives. A final AA Study will provide decision makers the information needed to approve further investigation in the form of a Draft Environmental Impact Statement/Draft Environmental Impact Report (DEIS/DEIR).

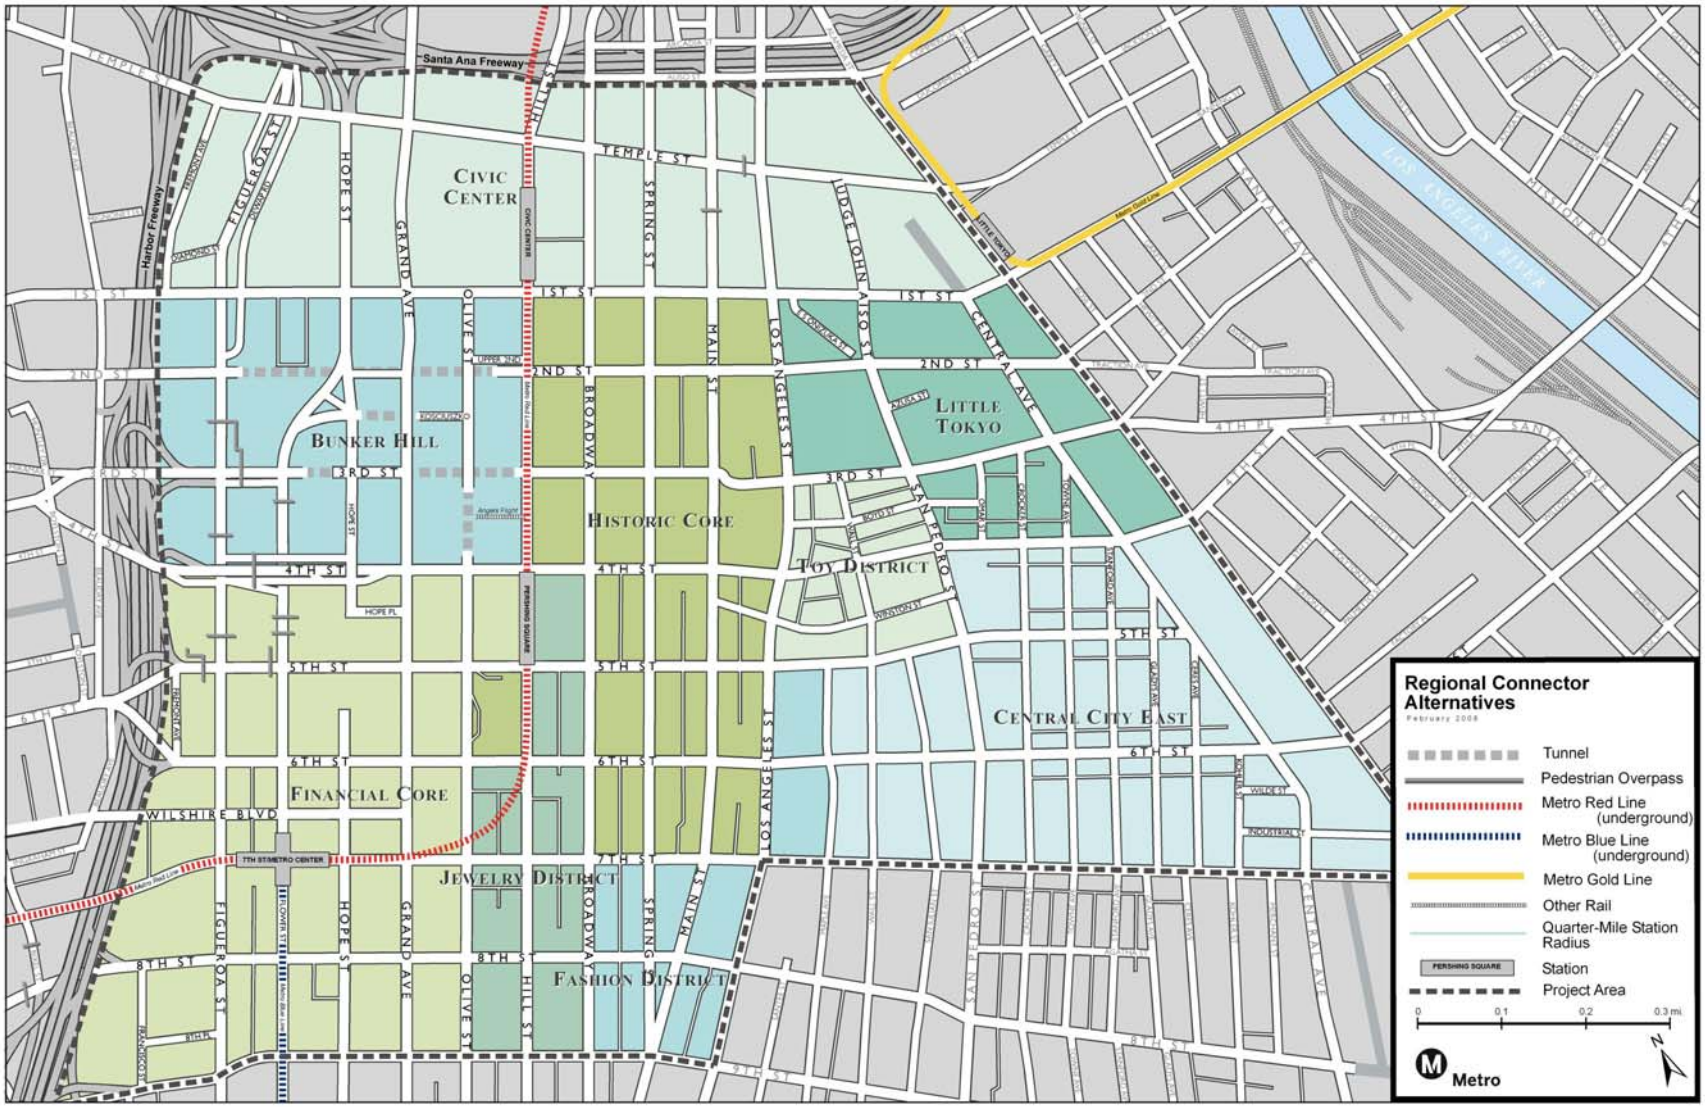


Figure 1-1 Project Study Area (PSA)

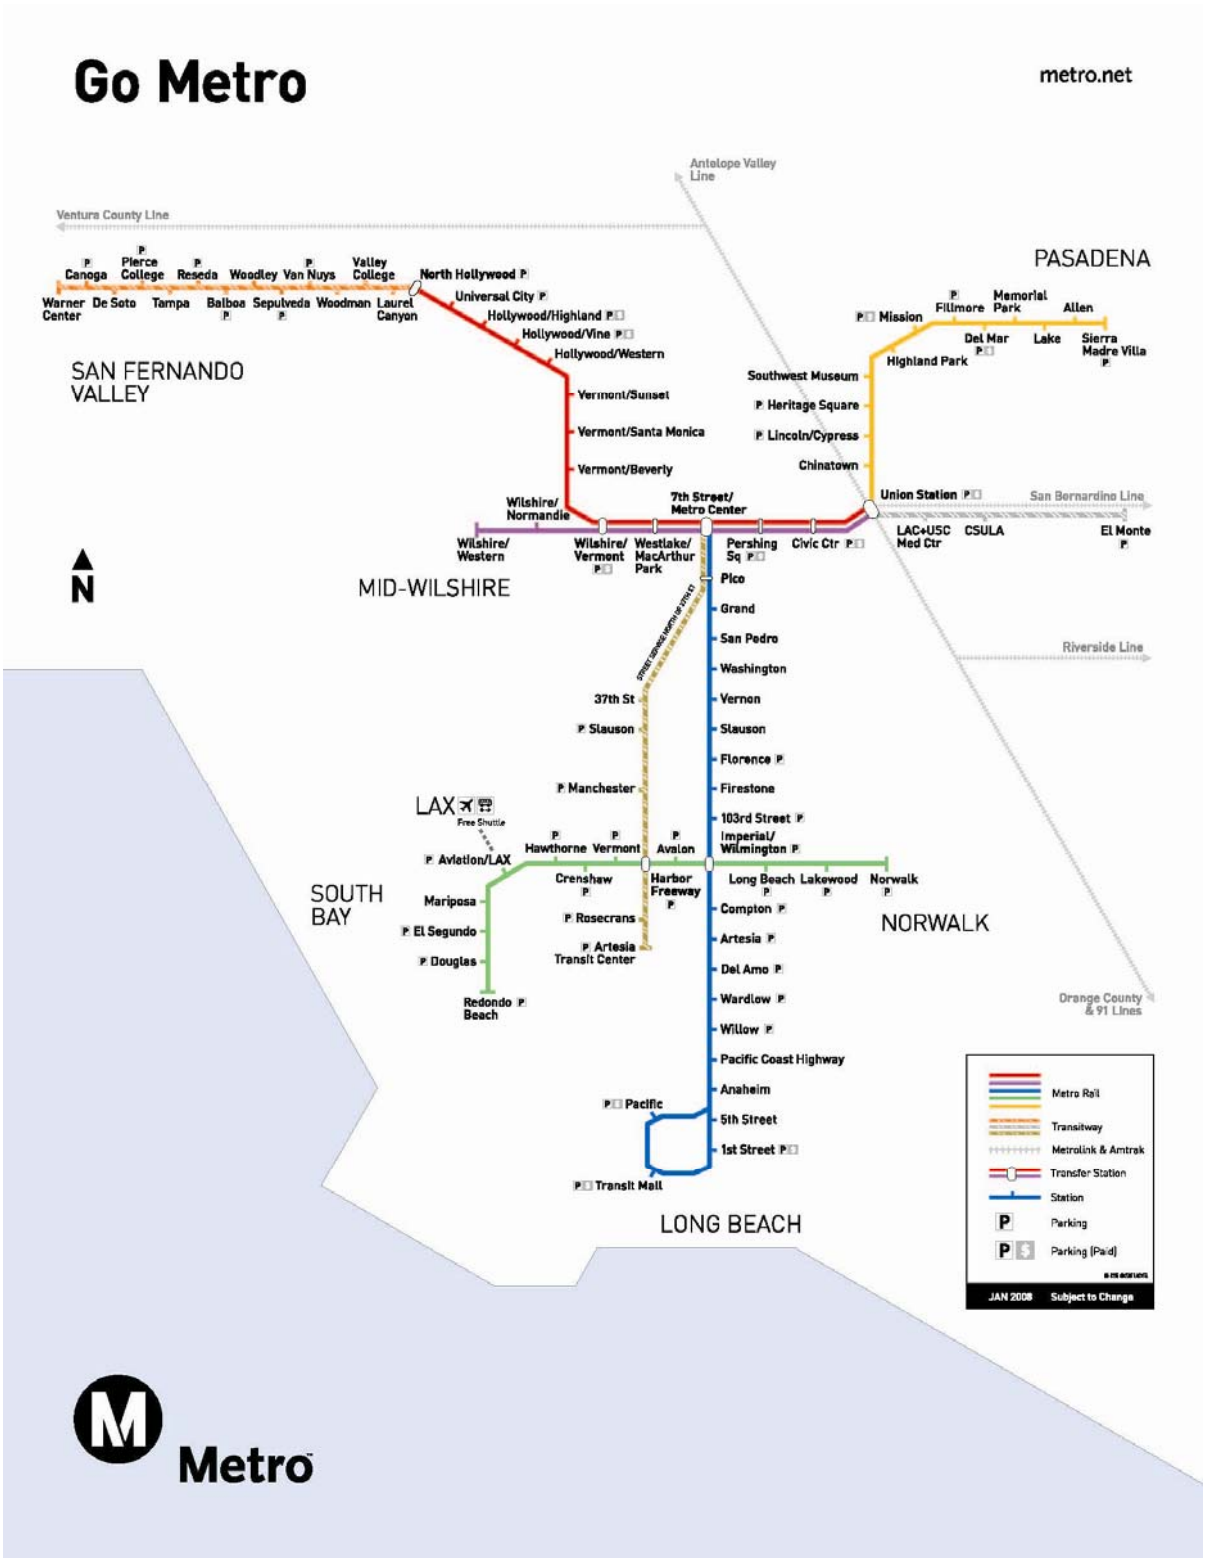

Figure 1-2 Metro Rail Map - Operational System, Fall 2008

1.2 Background

1.2.1 Location

The PSA is located in the downtown area of the City of Los Angeles. The PSA is bounded by the Harbor Freeway (SR-110) on the west, the Santa Ana Freeway (US-101) on the north, Alameda St. on the east, and 7th and 9th Streets on the south. The PSA is within the Central Business District (CBD) of Los Angeles, consisting of a dense urban core with an active Financial District lined with skyscrapers of 40 stories or more, a reviving Historic Core and a thriving cultural and civic center. Because the PSA is built-out, there are no particularly underdeveloped areas that are clear candidates for the Regional Connector. Therefore, all streets and roadways within the PSA are potential candidates for the Regional Connector route.

To the northeast of the PSA lies the Metro Gold Line extending from Union Station south to 1st St. and Alameda St., then heading east on 1st St. with one station just north of 1st St. and east of Alameda. To the southwest of the PSA lies the Metro Blue Line terminus of 7th St./Metro Center Station at 7th St. between Flower and Figueroa Streets.

Because of its central location, the Regional Connector will improve the operation of the entire Metro Rail transit system and provide benefit to the greater Los Angeles County (County) region. The Regional Connector may also replace duplicative bus lines with a single high-capacity link between 7th St./Metro Center Station and Union Station, thus improving bus operations in the County as well.

1.2.2 History

Rail transit in Los Angeles dates to 1872, when Southern Pacific began construction on a passenger rail line from downtown to San Pedro, with the intent of eventually monopolizing the regional transportation system. By the 1920s, the Southern Pacific and Pacific Electric systems had nearly 800 cars in service and hundreds of miles of tracks. Los Angeles Railway also operated a local streetcar system serving the downtown core and the nearby neighborhoods, which carried the bulk of Los Angeles' urban ridership. Notable busy lines included the Aiso St. service to Boyle Heights, the Temple and 2nd St. cable cars on Bunker Hill, and the Angels Flight funicular railway. Pacific Electric's Hollywood, Glendale, and San Fernando Valley trains entered the one-quarter-mile long Belmont Tunnel at the tail end of their trips to the Subway Terminal Building at 4th and Hill Streets in downtown.

Despite the extensive track and power infrastructure, Los Angeles' rail transportation system would last only four more decades. Americans traded streetcars for private automobiles with record speed and moved to neighborhoods beyond the railroads' reach. Rail transit's final zenith came during World War II, when fuel, metal, and rubber rationing briefly forced millions of Americans back onto streetcars to get to their jobs.

With the end of the war came a period of economic and industrial prosperity and the pent-up demand for new automobiles could finally be met. With few rail riders remaining and new diesel bus technology offering a cheap substitute for streetcar service, cash-strapped transit operators nationwide began canceling routes and removing tracks. Los Angeles' system closed entirely, with the last train making its trip from downtown to Long Beach in 1963.

Freed by the heightened mobility that private cars offered, people began working in increasingly suburbanized settings, and the old downtown core plunged into decline for several decades. In recent years, with traffic congestion mounting, the mobility that supported geographically-dispersed job and housing patterns has become increasingly constrained. Longer commute times, ever-climbing gas prices and increased concern about vehicle greenhouse gas emissions leading to climate change have prompted many Los Angeles residents to seek a return to the transit-friendly urban form of decades past. Downtown Los Angeles has seen a recent surge in development and many residents are rediscovering the forgotten urban core.

During the mid-1980s, the Los Angeles County Transportation Commission and Southern California Rapid Transit District began piecing together the railroad rights-of-way abandoned decades earlier with the intent of bringing rail transit back to Los Angeles.

Today, the Metro Rail system consists of 73 track miles and downtown Los Angeles is once again served by a radial network of rail transit lines. The Metro Red Line has assisted in the resurgence of the downtown area, including the PSA, by improving accessibility and facilitating movement between various districts.

In addition, the Southern California Regional Rail Authority has gradually purchased its own right-of-way and developed a 512-mile commuter rail system over the course of the past two decades, linking commuters throughout the region to their downtown jobs.

1.3 Past Studies

Pasadena – Los Angeles Light Rail Transit Project EIR 1988-1993

The concept of a light rail link through the downtown core from 7th St./Metro Center Station to Union Station originated from the Environmental Impact Report (EIR) for the Pasadena-Los Angeles Light Rail Transit Project. This study explored extending the Long Beach-Los Angeles Light Rail Transit line, now the Metro Blue Line, from downtown through Pasadena.

After environmental clearance and public approval, the Pasadena-Los Angeles Light Rail Transit Project, now the Metro Gold Line, was built. The Metro Gold line now runs from the Sierra Madre Villa Station in Pasadena to Union Station.

It was specifically indicated in the study that a Gold Line rail connection is possible between Union Station and 7th/Metro Center Station to reduce transfers between the Metro Red, Gold and Blue Lines.

Blue Line Connection Preliminary Planning Study

In 1993, Metro completed a preliminary planning study to analyze alternatives for connecting the Long Beach Blue Line, already in operation, to the Pasadena Blue Line (now the Metro Gold Line), which was not yet under construction at that time. Although the Metro Gold Line provides a viable service as stand-alone transit from downtown Los Angeles to Pasadena, a potential capacity problem for the Metro Red Line was identified, as it was the sole rail connection between Union Station and the 7th St./Metro Center Station. Metro officials recognized that building a connection between the Long Beach and Pasadena light rail lines would alleviate the capacity issues, and increase the overall usefulness of the system.

Los Angeles Eastside Corridor Final Supplemental EIR/EIS 2002

At the time of the Blue Line Connection Preliminary Planning Study, an extension of the Metro Red Line to Boyle Heights was also being considered. The preferred alternative was a 3.1-mile long heavy rail transit (HRT) subway with 4 stations.

In February 2002, Metro approved the Metro Gold Line Eastside Extension using Light Rail Transit (LRT) in lieu of the Red Line Eastside Extension. Running from Union Station to Atlantic Station in East Los Angeles, this six-mile, eight-station extension traverses Alameda St., 1st St., Indiana St., and 3rd St. A new bridge connects Union Station to the eastern edge of downtown by going south over the US-101 freeway to the intersection of Alameda St. and Temple St. The route is at grade on the eastern side of Alameda St. from Temple St. to 1st St. An at-grade station at 1st and Alameda Streets is sited on the northeast corner of the intersection to minimize traffic impacts.

Regional Light Rail Connector Study 2004

Based on new alignment opportunities created by the approval and construction of the Metro Gold Line Eastside Extension, Metro initiated an engineering study to identify potential alignment, station and configuration alternatives for a new LRT connection between the Metro Blue and Gold Lines. The new alternatives connected the Metro Gold Line Eastside Extension in the vicinity of the Little Tokyo/Arts District Station at 1st and Alameda Streets to the 7th St./Metro Center Station.

Forty-one initial alternatives were developed and initial screening reduced the number of alternatives to 16. The screening was based on characteristics, service area, cost, complexity of engineering and other similar criteria. There was no public input process performed and no preferred alternative identified in this study.

This AA includes several of the alternatives identified in the 2004 study. Some of the other 2004 alternatives are no longer feasible due to changed conditions along the proposed alignments.

1.4 Project Study Area Demographics

Data presented in this section were obtained from the Southern California Association of Governments (SCAG, 2005) and the U.S. Census Bureau (2000). Data are representative of demographic conditions at the time of data-gathering and are used as the basis of evaluation in this AA.

The Regional Connector PSA covers 1.6 square miles, or 0.03 percent of the 4,752 square miles of the County. The total residential population of the PSA is 17,795, or 0.18 percent of the total County population. The average population density within the PSA is 11,685 per square mile, 5.5 times that of the County.

Despite its small size and residential population, the Regional Connector PSA sustains 3.62 percent of the County's Total Employment with 168,328 jobs. Employment density in the PSA is 110,529 employees per square mile which is more than 100 times the County-wide employment density.

Table 1-1 summarizes the PSA and County population and employment information for 2005. Population and employment growth are discussed further with respect to transit dependency in Sections 1.7.4 and 1.7.5.

Table 1-1 Population and Employment

Demographics	PSA	L.A. County	Percent of County
Population	17,795	10,010,315	0.18%
Population Density (people/sq. mi.)	11,685	2107	NA
Total Employment	168,328	4,644,010	3.62%
Employment Density (jobs/sq. mi.)	110,529	977	NA

Source: SCAG, 2005

According to 2000 Census data, the PSA has higher proportions of Asian and Black residents than the County. Black residents compose 30.6 percent of the PSA, compared with 9.6 percent of the County; they reside in the PSA primarily east of Hill St. and south of 1st St.

Asian residents, who live primarily between 1st St. and 5th St., compose 23.5 percent of the PSA, compared with 11.9 percent of the County.

The PSA has significantly lower compositions of White and Hispanic populations when compared to the County.

Table 1-2 shows the racial and ethnic breakdown of the PSA. Figures 1-3 through 1-8 illustrate the population's racial and ethnic distribution throughout the PSA.

Table 1-2 Racial and Ethnic Composition				
Demographics	PSA		Total LA County	
	Number	%	Number	%
Race				
Total Population	17,795	100%	9,519,338	100%
White	4,968	27.9%	4,622,759	48.6%
Black/African American	5,441	30.6%	916,907	9.6%
American Indian	180	1.0%	68,471	0.7%
Asian	4,187	23.5%	1,134,263	11.9%
Pacific Islander/Hawaiian	9	0.1%	27,221	0.3%
Some other race	2,139	12.0%	2,262,925	23.8%
Two or more races	917	5.2%	486,792	5.1%
Ethnicity				
Total Population of PSA	17,795	100%	9,519,338	100%
Hispanic or Latino (regardless of race)	4,258	23.9%	4,242,213	44.6%

Source: U.S. Census Bureau, 2000

Residences in the PSA are categorized in SCAG data as single-family homes, multi-family homes, or group quarter residences, which include military barracks, dormitories, and institutional housing. Data for the number of low, medium, and high-income households in the PSA were available for single-family and multi-family residences only. In 2005, there were 9,673 of these households with a median household income of approximately $45,000. Group quarters added 5,466 residences.

Based on these 2005 data, the PSA is primarily composed of low-income households, with a moderate portion of medium-income household population, as shown in Table 1-3.

Table 1-3 Project Study Area Income Status		
Demographics	PSA	Percent
Total Residences	15,136	N/A
Total Households	9,673	100%
Low Income Households	7,244	75%
Medium Income Households	2,009	21%
High Income Households	417	4%

SCAG, 2005

According to data presented in Table 1-4, only 5.5 percent of the population in the PSA is age 18 or younger, compared to 29.4 percent of the population of the County. The PSA also has a higher percentage of elderly residents (19.7 percent) compared to the County (9.7 percent).

Table 1-4 Population Age				
Age	PSA	%	L.A. County	%
18 and under	976	5.5%	2,798,604	29.4%
65 and over	3,497	19.7%	926,670	9.7%

Source: U.S. Census Bureau, 2000; SCAG, 2005

The young and the elderly have a higher propensity for using public transportation, since these groups are less likely to have driver's licenses or access to private automobiles.

Children and seniors living outside of the PSA will also benefit from the improved mobility and transit access provided by the Regional Connector, especially if they travel to downtown Los Angeles frequently.

The PSA is currently undergoing significant changes in terms of housing and demographics. Within the last four years, new market-rate condominium towers have been completed, historic buildings have been converted to loft housing, and new entertainment centers have been approved for construction, bringing renewed interest to downtown. These activities continue to bring about demographic changes that may not be reflected in data from 2005.

PSA residents use transit more than people in other areas of the County. Twenty-three percent (or 1,025 people) of people age 16 and older who both live and work in the PSA commute via public transportation, compared to seven percent of the entire County.

Figure 1-9 shows the distribution of public transportation users within the PSA. They tend to live in areas where there are high percentages of zero-vehicle households, as shown in Figure 1-10. A much higher proportion of households in the PSA lack vehicle access (69 percent) than in the County as a whole (12 percent).

1.5 Public Transportation Facilities and Services

1.5.1 Project Study Area Public Transit Context

Downtown has the highest concentration of transit service of any area in the County. At present, ten transit operators provide service along 112 bus routes and four Metro Rail lines within the PSA, as illustrated in Figure 1-11. There is also heavy pedestrian activity throughout the PSA. The bus and rail lines branch out in all directions from the PSA to many destinations in Los Angeles County. Freeway express service also allows riders to reach destinations in Orange, San Bernardino, and Ventura Counties during peak commute hours.

1.5.2 Transportation Facilities and Services in the Project Study Area

1.5.2.1 Metro Rail

Metro provides rail service to the PSA with the Metro Red Line from Union Station to North Hollywood, the Metro Purple Line from Union Station to Wilshire Center, the Metro Blue Line from the 7th St./Metro Center Station to Long Beach, and the Metro Gold Line from Union Station to Pasadena. The rail service consists of 62 rail stations and 73 track miles.

Figure 1-10 Zero-Car Households in PSA

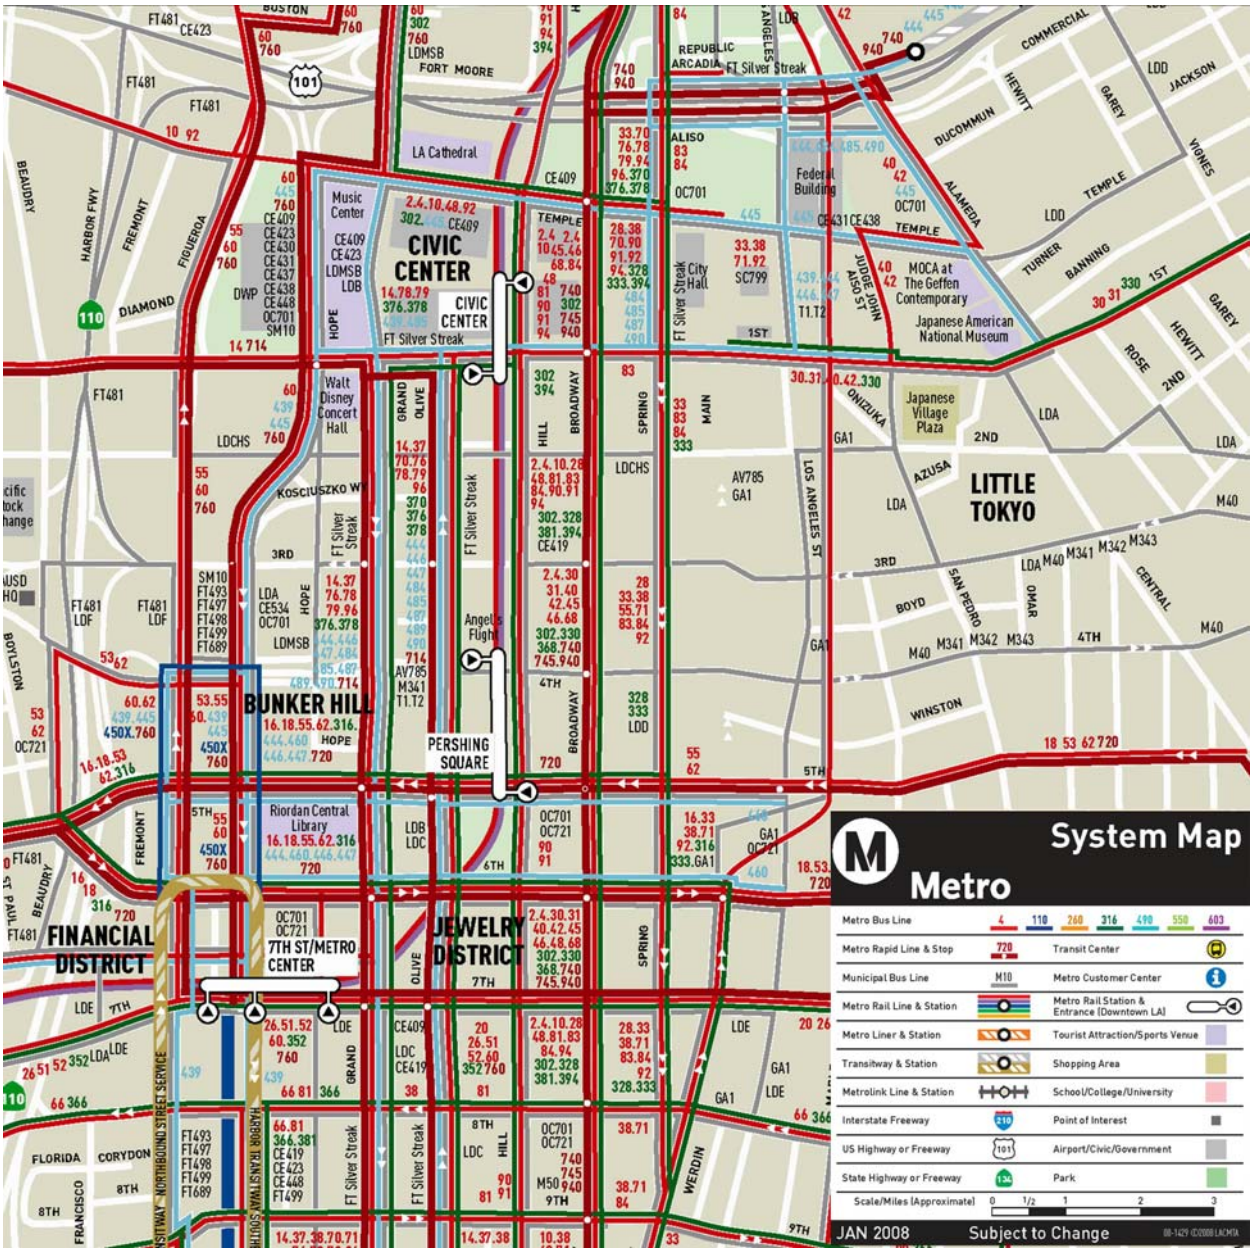

Figure 1-11 Transit in the PSA

Future service will be provided by the light rail extensions currently under construction to East Los Angeles (Metro Gold Line Eastside Extension, scheduled to open in late 2009) and Culver City (Metro Expo Line, scheduled to open in 2010). All Metro Rail stations provide connections to additional public transportation options, including Metrolink and Amtrak commuter rail services and bus service provided by Metro and other transit operators. Table 1-5 summarizes existing and future Metro Rail Lines currently under construction in the PSA.

Table 1-5 Existing and Future Metro Rail Lines in the PSA					
Existing Metro Rail Lines					
Line	Mode	Route	Length	Weekday Ridership	Year Completed
Red/Purple	HRT	Union Station to North Hollywood, Wilshire/Western	17.4 Miles	136,355	1993-2000
Blue	LRT	7th St./Metro Center to Long Beach	22 Miles	77,834	1990-1991
Gold	LRT	Union Station to Sierra Madre Villa	13.6 Miles	19,579	2003
Future (Under Construction) Metro Rail Lines					
Line	Mode	Route	Length	Expected Year 2020 Ridership	Year Complete
Gold	LRT	Union Station to East Los Angeles	6 Miles	23,000	2009
Expo	LRT	7th St./Metro Center to Culver City	8.5 Miles	43,600	2010

Metro Red Line – This HRT subway line originates from Union Station and travels west (Figure 1-12). The line began operating with service between Union Station and Westlake/MacArthur Park station (5 stations) in 1993. An extension to Wilshire/Western station, part of which was later renamed the "Metro Purple Line," was completed in 1996. The extension of the Metro Red Line northwest from Wilshire/Vermont station to Hollywood/Vine station with an additional 5 stations opened in 1999. Three more stations were added with the opening of the extension to North Hollywood in 2000.

Figure 1-12 Metro Red Line

Metro Purple Line – This HRT line originated as an extension of the Metro Red Line with 3 stations from the Wilshire/Vermont Station west to the Wilshire/Western Station. It opened in 1996 and was renamed the Metro Purple Line in 2006. As of the 2007 fiscal year, the Red and Purple Lines experienced approximately 136,355 weekday boardings on 17.4 miles of track.

Metro Blue Line – This line opened in 1990 and was the first LRT system in Los Angeles since the previous rail transit system closed in the 1960s. The 22-mile line has 22 stations and runs from 7th St./ Metro Center Station south to Long Beach. The Blue Line averaged 77,834 weekday boardings in the 2007 fiscal year.

Metro Gold Line – This LRT line from Union Station to Pasadena has 13 stations, 13.6 miles of track, and began operating in 2003 (Figure 1-13). In the 2007 fiscal year, the line averaged 19,579 weekday boardings.

Metro Gold Line Eastside Extension – The first phase of this LRT project is expected to open in 2009, making stops in Little Tokyo, Boyle Heights, and East Los Angeles. The six-mile line will feature eight new stations and connect with the existing Metro Gold Line to Pasadena without requiring riders to transfer at Union Station. Metro estimates that there will be 23,000 riders each weekday on the Eastside Extension by 2020.

Metro Expo Line – The first phase of the Exposition Light Rail Transit line is expected to open in 2010. The 8.5-mile line will run primarily at grade and serve 11 stations from 7th St./Metro Center Station in downtown to the intersection of Washington Blvd. and National Blvd. in Culver City. Average weekday ridership is expected to reach 43,600 by 2020[1].

Figure 1-13 Metro Gold Line

There are three Metro Rail stations located within the PSA. The HRT Metro Red and Purple Line stations are Civic Center Station (Hill St. between Temple and 1st Streets), Pershing Square Station (Hill St. between 4th and 5th Streets), and 7th St./Metro Center Station (7th St. between Figueroa and Hope Streets, and Flower St. between Wilshire Blvd. and 8th St.). The 7th St./Metro Center Station serves as a transfer point to the LRT Metro Blue Line as well. The LRT Little Tokyo/Arts District Station (Alameda St. between Temple and 1st Streets) will be a fourth station when it opens in 2009 as part of the Metro Gold Line Eastside Extension.

The Regional Connector will provide an alternate route between 7th St./Metro Center Station and Union Station, where the existing Metro Red and Purple Lines increasingly experience crowding and capacity issues. The Regional Connector will also provide more capacity to accommodate Metro Blue and Expo Line trains in the downtown area, and will thus enable the planned combined frequency of these two services. It would also reduce the need for Red and Purple Line transfers for downtown-bound Metro Gold, Blue, and Expo Line passengers, who would otherwise need to transfer to reach many destinations in the PSA. Should the Regional

1 www.buildexpo.org, FEIR, 7-123

Connector be constructed as a LRT link, it would allow five-minute headways in each direction. Combined, there could be trains as frequently as every 2 ½ minutes along the Regional Connector.

1.5.2.2 Metro Bus

Because downtown Los Angeles is a regional employment hub, there are numerous bus operators serving the area. These operators are:

- Antelope Valley Transit Authority (AVTA)
- City of Gardena (Gardena Municipal Bus Lines)
- City of Santa Clarita Transit
- City of Santa Monica (Big Blue Bus)
- Foothill Transit
- City of Los Angeles Department of Transportation (LADOT)
- Los Angeles County Metropolitan Transportation Authority (Metro)
- City of Montebello (Montebello Bus Lines)
- Orange County Transportation Authority (OCTA)
- City of Torrance (Torrance Transit)

With the exception of Metro, LADOT, Montebello Bus Lines, and Gardena Municipal Bus Lines, these transit operators run mostly peak commute (rush) hour, peak-direction commuter bus service in and out of the PSA. LADOT provides both long-distance freeway commute service as well as frequent Downtown Area Short Hop (DASH) service along short, mostly circular shuttle routes within the downtown area. In addition to public transit services, several high-rise office tenants within the PSA offer shuttle bus service to Union Station for their employees.

The majority of bus transit service in the PSA, as well as the Los Angeles region, is provided by Metro, which operates a number of short and long-distance radial lines, as well as cross-town service, express service, and limited overnight service. The combined number of transit vehicle boardings and alightings in the PSA on Metro buses alone totals 185,000 on a typical weekday. The 91,823 weekday boardings account for 7.75 percent of the 1,184,720 bus boardings system-wide.

Metro's bus transit services vary considerably in speed and capacity. The most basic routes provide line-haul service to and from downtown along arterial streets. Heavily-traveled routes often have overlaid limited-stop or Metro Rapid bus service.

Metro Rapid bus service includes traffic signal priority, short headways, and limited stops, which increase corridor average bus speeds by about 3-4 mph compared to local service, which typically operates in the 9-12 mph range. Metro currently provides Rapid service into the Regional Connector PSA from major intersections along Beverly Blvd. (during peak hours only), Wilshire Blvd., Whittier Blvd., South Broadway, and Hawthorne Blvd. Six additional Metro Rapid bus lines are scheduled to open by June 2008. Of these future routes, lines 730 (Pico Blvd.) and 753 (Central Ave.) will serve the PSA.

Additionally, Metro Rapid Express rush hour service to downtown commenced in June 2007 with the opening of line 940 (Hawthorne Blvd. Rapid Express). Rapid Express service is essentially the same as Rapid service, but serves only one third of the Rapid route's stops, providing a slight increase in speed.

The Regional Connector will offer the opportunity to consolidate some of this overlapping bus service into one new high-capacity route, thus reducing operating expenses.

The majority of the publicly-provided commuter services originating east of downtown use the El Monte Busway. Constructed in 1976, these high capacity bus-carpool lanes parallel the San Bernardino Freeway (I-10) between the City of El Monte and downtown. Similarly, the commuter buses coming from points south and southeast of downtown primarily use the Harbor Transitway, completed in 1996, which runs along the median of SR-110 between Artesia Blvd. and Adams Blvd.

By linking the Metro Gold, Blue, and Expo Lines, which roughly parallel several of the bus lines along the transitways, the Regional Connector will potentially make the rail system more attractive than the transitway bus service. The Regional Connector would provide better links between the existing LRT stations, many of which are centrally located in dense neighborhoods and business districts. The busway stations are unattractive by comparison because they are located in freeway medians, which are uninviting to pedestrians and usually not immediately adjacent to activity centers.

1.5.2.3 Commuter Rail

Commuter rail service to downtown is provided primarily by Metrolink and Amtrak, with connections to Metro Rail service at Union Station, located one-tenth-mile outside of the PSA. Most passengers arriving at Union Station on Metrolink are bound for the CBD and presently use the Metro Red Line, DASH buses, or employer-provided shuttles to complete their trips. Some passengers may use the Regional Connector if it reduces trip times or transfers.

Metrolink has operated under the Southern California Regional Rail Authority (SCRRA) since 1992, serving the counties of Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura. Metrolink provides 512 miles of service (including tracks shared with Amtrak) to 55 stations on seven routes. Average weekday ridership on Metrolink trains from October through December 2007 was over 42,000 daily boardings, with the majority of trips (56.4 percent) beginning or ending at Union Station.

Amtrak is an inter-city rail system providing passengers at Union Station with regional, statewide, and nationwide service.

1.6 Performance of the Travel System

Southern California is faced with multiple mobility challenges that hinder the region's ability to effectively meet additional travel demand. One of the most pressing issues is population growth. The County alone is expected to increase by 2.2 million people, nearly twice the population of the City of San Diego, to a total of 12.2 million people from 2005 to 2030. This expected population growth will lead to increased travel demand throughout the region.

The transportation network includes 9,000 lane-miles of freeway, more than 42,000 lane-miles of arterials, and several large public transit service providers.[2] Yet growth of the transportation system has not kept pace with population growth and increases in transportation demand. As the population in the region doubled from 1960 to 2000, highway miles increased by less than 30 percent.[3] The congestion caused by insufficient transportation lanes affects both personal travel and goods movement. The majority of the congestion is from travel on the highways and local arterial network regardless of transportation mode. If the current trend persists, travel delays are expected to rise to 5.4 million person hours by 2030, more than double currently experienced delays, which will deeply affect highway productivity.[4]

If inadequately addressed, these challenges could hamper future population growth, economic development, commuter safety, existing infrastructure, goods movement, air quality, and other environmental conditions. If no action is taken to improve transportation mobility, SCAG estimates that daily person hours of delay would increase from 2.2 million hours under the 2000 Base Year to 5.4 million hours under the 2030 Baseline.

To define and address mobility issues, SCAG developed regional performance indicators that help in understanding the problem, setting goals for improvement, and measuring progress towards the goals. The following section describes regional performance indicators and baseline estimates of performance. By providing more attractive alternatives to the automobile, improving transit connections in the downtown Los Angeles area becomes one part of a larger, comprehensive strategy to meet regional travel demand.

1.6.1 Traffic Volumes and Operating Conditions

This section summarizes traffic volumes and operating conditions at key roadway segments and intersections within the PSA. Existing daily, AM peak and PM peak traffic volume data were obtained from LADOT. An analysis of existing conditions was

[2] SCAG 2004 RTP Chapter 2
[3] SCAG 2004 RTP Executive Summary
[4] SCAG 2004 Draft RTP PEIR

performed for the key roadway segments using daily traffic volumes and the key intersections using AM and PM peak hour turning movement data.

The roadway segment analysis was performed using a Volume-to-Capacity (V/C) ratio of the average daily traffic (ADT). Existing volumes were obtained from LADOT and the capacity was based on the roadway's General Plan facility type classification.

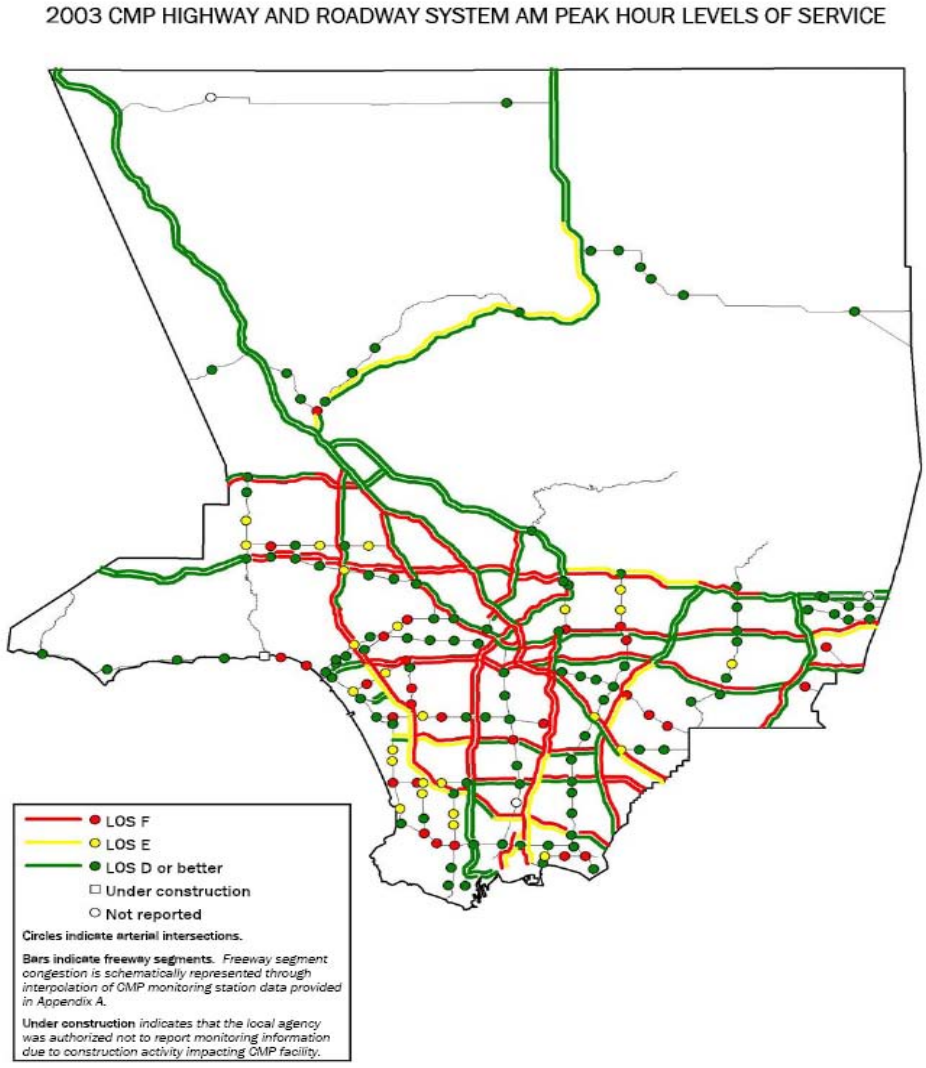
For intersections, the AM and PM peak hour volumes were analyzed using the Intersection Capacity Utilization (ICU) methodology, which determines a V/C ratio based on the critical intersection approach movements and a corresponding Level of Service (LOS). LOS is a qualitative measure used to describe traffic flow conditions, ranging from excellent flow (LOS A) to overloaded, stop-and-go conditions (LOS F). Level of service definitions and corresponding V/C ranges are presented in Table 1-6.

Table 1-6 Level of Service Definitions

Level of Service	Volume/Capacity Ratio	Definition
A	0.000 - 0.600	FREE FLOW. No vehicle waits longer than one red light and no green light phase is fully used.
B	0.601 - 0.700	REASONABLY FREE FLOW. An occasional approach phase is fully utilized; many drivers begin to feel somewhat restricted within groups of vehicles.
C	0.701 - 0.800	STABLE FLOW. Occasionally drivers may have to wait through more than one red light; backups may develop behind turning vehicles.
D	0.801 - 0.900	APPROACHING UNSTABLE FLOW (acceptable for urban conditions). Delays may be substantial during portions of the rush hours, but enough lower volume periods occur to permit clearing of developing lines, preventing excessive backups.
E	0.901 - 1.000	UNSTABLE FLOW (practical capacity). Represents the most vehicles intersection approaches can accommodate; may be long lines of waiting vehicles through several signal cycles.
F	>1.000	FORCED OR BREAKDOWN FLOW. Backups from nearby locations or on cross streets may restrict or prevent movement of vehicles out of the intersection approaches. There are tremendous delays with continuously increasing queue lengths.

Source: Transportation Research Board, Highway Capacity Manual, 2000

Freeways within the PSA already operate at LOS F during peak hours and, if not addressed, this trend is expected to worsen through the year 2030. Nearly all areas of the County experience freeway congestion during peak hours. However, the congestion on freeways within the PSA is among the worst and occurs during both the morning and evening rush hour periods, as illustrated in Figure 1-14.



2003 CMP HIGHWAY AND ROADWAY SYSTEM AM PEAK HOUR LEVELS OF SERVICE
LOS F

Not reported
Circles indicate arterial intersections.
Bars indicate freeway segments. Freeway segment congestion is schematically represented through interpolation of CMP monitoring station data provided in Appendix A.
Under construction indicates that the local agency was authorized not to report monitoring information due to construction activity impacting CMP facility.

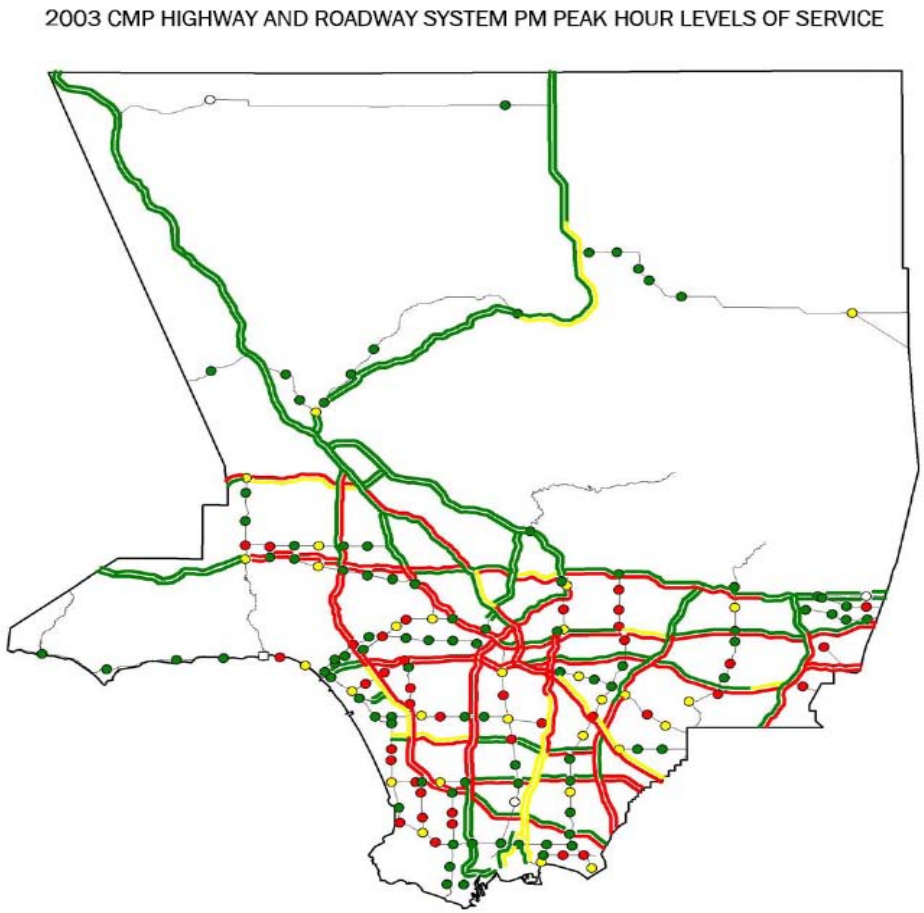

Figure 1-14 Freeway Levels of Service

Table 1-7 and Table 1-8 summarize the existing operating conditions for the key intersections and roadway segments in the PSA. All of the key intersections currently operate at LOS D or better during both the AM and PM peak hours. The only exception is the intersection of Alameda and 1st Streets, which currently operates at LOS F in the AM peak hour.

Table 1-7 Existing (2007) Intersection Level of Service

Intersection	AM Peak Hour		PM Peak Hour	
	V/C Ratio	LOS	V/C Ratio	LOS

1.6.2 Transit Operating Conditions

Bus service runs in a grid pattern through the downtown area, with most lines terminating at the downtown periphery after having passed through. Nearly all streets within the PSA have bus service during peak hours.

On several routes, headways shrink to less than five minutes during rush hour. Some stops are served by over a dozen lines during peak hours. Some of the most heavily transit-served streets in the PSA are 1st St., the 4th St./5th St. couplet, Hill St., Broadway, the Main St./Spring St. couplet, and the Grand St./Olive St. couplet. Downtown streets with the highest bus ridership include Broadway, Hill St., Spring St., Main St., Flower St., and Grand Ave.

Of the numerous bus routes serving downtown, 28 pass within one block of both Union Station and the 7th St./Metro Center Station, the termini of the Regional Connector corridor. Eighteen of these lines are operated by Metro, with nearly 16,000 daily passenger boardings and alightings within the PSA.

Table 1-9 shows the bus lines provided by each bus operator, and the frequency of available service for each bus route.

The four busiest Metro bus lines serving the downtown area all originate in West Los Angeles or Santa Monica. The Metro bus lines with the highest number of boardings within the PSA serve areas east and south of downtown. This establishes the Westside, the Eastside, and South Los Angeles as primary origins and destinations for current bus passengers traveling in and out of the PSA. See Table 1-10 for a summary of Metro bus transit ridership by line and direction.

Of the 18 Metro bus lines that pass within a block of both Regional Connector termini (Union Station and 7th St./Metro Center Station), 11 are freeway commuter lines, and all have only low-to-moderate ridership. Even the busiest of these lines only exhibit a modest number of boardings within the PSA, ranging from 50 to 1400 per day.

Four of the five Metro bus lines with the lowest ridership in downtown are also within a block of both Regional Connector termini (442 – Hawthorne via Harbor Transitway, 489 – Temple City via El Monte Busway, 439 – Aviation Green Line via Culver City, and 445 – San Pedro via Harbor Transitway).

Please see Table 1-11 for a summary of ridership on these lines.

Most of the lines paralleling the Regional Connector route (serving both Union Station and 7th St./Metro Center Station) originate from points east of downtown, and five of them use the El Monte Busway. Most of the lines function primarily as peak hour commuter buses; low ridership compared to other Metro bus lines may be attributable to their lack of off-peak service.

Metro operates 125 bus stops within the PSA. The five busiest Metro bus stops, each with 3,800-7,200 daily boardings, are located along Hill St. and Broadway between 5th and 7th Streets (Table 1-12). All of these stops are within one-quarter mile of the existing Pershing Square Station. If the Regional Connector stops near Broadway, Hill, and Spring Streets, it will enable transfers to the busiest north-south bus corridors in the area.

Table 1-9 Bus Transit Routes and Frequency of Bus Service in Project Study Area					
Operator	*Line*	*Mode*	*Weekday Hours of Operation*	*Peak Hour Frequency*	*Route Description*

Most of the other busy Metro bus stops in the PSA are located in the Financial Core and Civic Center areas, both of which will be served by the Regional Connector. Additionally, other transit operators have bus stops within the PSA, although their ridership data were not available for this AA.

1.6.3 Regional Objectives

SCAG is responsible for regional transportation planning for six counties within Southern California: Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. In 2004, SCAG released "Destination 2030, the Regional Transportation Plan (RTP)." In May 2008, it released an update entitled "Making the Connections." The documents provide a basic policy and program framework to improve the transportation system and integrate it with the population growth patterns for the region through 2030.

Destination 2030 is a performance-based plan with the following goals:

- maximize mobility and accessibility,
- ensure safety and reliability,
- preserve our transportation system,
- maximize productivity of our system,
- protect the environment, and
- encourage land-use and growth patterns that complement our transportation system.

SCAG developed performance indicators and measures to quantify the goals and evaluate progress towards achieving the goals. Table 1-13 lists the performance indicators, associated measures, and final projected outcomes. The outcomes are estimated for the Plan as a whole for 2030, and not for individual projects.

If no action is taken, performance in the region will worsen. SCAG projects that between Base Year 2000 and 2030:

- Daily vehicle miles traveled in the region will increase by 35 percent from 361.5 million to 488.8 million.
- Average travel speed will reduce by 11 percent from 35.9 miles per hour (mph) to 31.9 mph.
- Daily person-hours of delay will increase by 250 percent from 2.2 million hours to 5.4 million hours.
- Average daily delay per person will increase by 78 percent from 8.0 minutes to 14.2 minutes.
- The percentage of peak period evening work trips completed within 45 minutes for autos will decrease from 88 percent to 82 percent; for public transit, it will decrease from 33 percent to 29 percent.
- Home to work average travel times will increase by 25 percent from 21.6 minutes to 25.9 minutes.

The Regional Connector would contribute to alleviating the mobility problem in the region and to achieving the Destination 2030 goals. It would do this by:

- extending the reach and connectivity of all but one of Metro's operational and under-construction LRTs;

- broadening the range of downtown destinations reachable with one transfer from the Metro Red and Metro Purple Lines;
- alleviating congestion on the downtown bus network; and
- increasing the availability of direct service to multiple destinations in Los Angeles County for passengers arriving on intercity services at Union Station.

The Regional Connector offers a public transit connection that would improve mobility and accessibility in the region and provide commuters with a simplified and reliable transportation option.

The area from which Regional Connector ridership is expected to be drawn includes several freeways and major intersections that have significant traffic congestion and long delays. The improved convenience of the Regional Connector would encourage use of a public transit alternative that would reduce daily vehicle trips, miles traveled, and congestion on the region's roadways.

The Regional Connector would augment public transportation service originating in areas with high population densities and households dependent on public transit. This would increase potential ridership, thereby increasing the project benefits and making it more cost-effective. In addition, the Regional Connector's service area covers the County's most highly-concentrated employment area and a major cultural, entertainment, and tourist destination.

1.7 Project Purpose

The purpose of this project is to improve the region's public transit service and mobility by linking the Metro Rail services of the Metro Gold Line, Metro Gold Line Eastside Extension, Metro Blue Line, and Metro Expo Line, thereby providing direct access to one of the region's major employment centers.

Since the completion of studies on the Metro Blue Line to Pasadena performed in 1993 and 1994, the Metro Rail system has grown substantially, with rail lines in operation or under construction extending over 70 track-miles within Los Angeles County. Currently, the Metro Red and Metro Purple subway lines serve as an interim connection between the Metro Blue Line at 7th St./Metro Center and the Metro Gold Line at Union Station, but the transfers involved are time-consuming, contribute to crowding on the subway platforms and trains, and may dissuade passengers from riding.

Table 1-13 Performance Indicators, Measures, and Outcomes of Destination 2030 Goals					
Performance Indicator	Performance Measure		Plan 2030	Base Year 2000	Baseline 2030
Mobility	Average Daily Speed (Miles per Hour)		35.2	35.9	31.9
	Average Daily Delay (Daily Person Hours in millions)		3.2	2.2	5.4
Accessibility	Percent PM peak period work trips within 45 minutes of home	Autos Transit	90% 37%	88% 33%	82% 29%
Reliability	Percent variation in travel time	6AM-7AM 7AM-8AM 8AM-9AM 3PM-4PM 4PM-5PM 5PM-6PM 6PM-7PM	10% 13% 13% 19% 18% 17% 20%	11% 15% 15% 21% 20% 19% 22%	N/A
Safety	Daily accident rates per million persons	Fatalities	0.27	0.28	0.28
		Injuries	10.7	11.0	11.0
		Property Damage	17.5	18.2	18.2
Productivity	Roadway capacity – vehicles per hour/lane (Lost Lane Miles)	AM peak PM peak	377 302	332 266	N/A
Sustainability	Total cost per capita to sustain current system performance		Plan 2030 estimates an additional cost of $20 per capita per year over base year		
Preservation	Maintenance cost per capita to preserve system at base year conditions (base year 2002, constant 2002 dollars)		~$80	~$63 (2002)	N/A
Environmental	Emissions generated by travel (over Baseline 2030)	CO PM10 Exhaust PM10	Plan 2030 estimates: 6-8% reduction 6-8% reduction 8-11% reduction		
Environmental Justice	Benefit vs. Burden by quintiles – Auto Percentage of Tax Paid and Time Savings (Quintile 1=lowest income, Quintile 5=highest income)	1 2 3 4 5	Plan 2030 estimates: Expenditure 9% 13% 18% 24% 37%	Time Savings 6% 14% 21% 29% 30%	
	Benefit vs. Burden by quintiles – Local Transit Percentage of Tax Paid and Time Savings (Quintile 1=lowest income, Quintile 5=highest income)	1 2 3 4 5	Plan 2030 estimates: Expenditure 9% 13% 18% 24% 37%	Time Savings 23% 30% 23% 16% 8%	

Source: SCAG Destination 2030, 2004

The Regional Connector will improve service for communities locally and across the region, allowing greater mobility and accessibility while supporting the revitalization of downtown. New stations will provide greater coverage of the downtown area, thus enhancing the convenience of the existing rail and bus system.

1.8 Major Themes Supporting Transit Needs in the Project Study Area

In evaluating the mobility problem and travel conditions within the PSA, several themes emerge which reinforce the need for transportation improvements. These themes are listed below, while subsequent sections address each theme in greater detail.

- Need for Transit Improvements Based on Current and Future Transit Conditions
- Transit Usage within the PSA
- Significant Transit Dependent Populations
- Regional Population and Employment Growth
- Population and Employment Densities
- Travel Demand Justifies Need for Transit Services
- Local Land Use Policies and Guidelines that Support Transit

1.8.1 Need for Transit Improvements Based on Current and Future Transit Conditions

According to Metro's 2004 Metro Rail Onboard Survey, 42 percent of Metro Gold Line riders indicated that they rode two trains on their one-way trips, and seven percent rode three trains. Additionally, Sierra Madre Villa Station to 7th St./Metro Center Station and Lake Station to 7th St./Metro Center Station were among the most popular station pairs on the Metro Rail system. Since Union Station is the only current rail-to-rail transfer point on the Metro Gold Line, these results suggest that a large portion of Metro Gold Line riders are transferring to the Metro Red Line to complete their trips. See Table 1-14 for a summary of survey results.

Table 1-14 Train/Bus Use per Trip

	All Lines	Blue	Red	Green	Gold
1 Train	53%	47%	60%	56%	49%
2 Trains	38%	44%	34%	31%	42%
3 Trains	7%	8%	4%	10%	7%
4 Trains	2%	1%	2%	2%	1%
1 Bus/Train	22%	16%	26%	20%	24%
2 Bus/Train	34%	34%	41%	26%	38%
3 Bus/Train	25%	28%	21%	29%	21%
4+ Bus/Train	19%	21%	13%	24%	17%

Source: 2004 Metro Rail Onboard Survey

Upon completion of the Metro Gold Line Eastside Extension, passengers bound for the PSA will generate many additional Metro Red and Purple Line transfers at Union Station, as well as new bus and Metrolink transfers. Metro Red and Purple Line trains typically layover at Union Station with their doors open for several minutes before departing, so patrons may be able to board waiting trains immediately upon entering the station, thereby potentially reducing platform crowding issues. However, the extent to which the opening of the Eastside Extension will affect platform crowding at Union Station remains to be seen.

Crowding in the passageways and rail platforms may, however, become a significant issue at 7th St./Metro Center Station. Once in operation, Metro Expo Line trains from Culver City will share the existing Metro Blue Line terminal platforms, where trains already operate on five-minute headways during peak hours. This could create rail congestion and rush hour delays at locations where existing facilities to reverse light rail trains consist of scissor crossovers at either end of the station. Scissor crossovers are diamond-shaped crossovers that allow trains to switch from one track to the other, but block all other train movements.

The Metro Blue Line boarding area consists of two side platforms, but typically only one of the platforms is used, and this currently contributes to passenger crowding at the station. Metro Red and Purple Line passengers wishing to use the Flower St. escalators must also share the crowded passageways leading to the Metro Blue Line platform. Metro Expo Line passengers would add to the crowds on the existing Metro Blue Line platform, as transfers to the Metro Red and Purple Lines also contribute to crowding on the lower platform. In such crowded conditions, the ability to quickly evacuate the station in an emergency could be compromised.

The proposed Regional Connector LRT services are shown in Figure 1-15.

The Regional Connector would eliminate many transfers and alleviate crowding at 7th St./Metro Center Station. In addition, it will reduce the number of transfers from the Metro Gold Line to the Metro Red and Purple Lines at Union Station by providing new single-vehicle LRT service through the downtown area. This will shorten walking distances and trip times for all rail passengers bound for the Bunker Hill area.

The Regional Connector would also eliminate many transfers at Union Station, as many of the passengers traveling to the Financial District from East Los Angeles or Pasadena would likely stay on the Metro Gold Line trains and continue along the Regional Connector instead of transferring to the Metro Red Line. Metro's 2004 Metro Rail Onboard Survey indicates that relatively few Metro Gold Line riders currently continue beyond 7th St./Metro Center Station toward Long Beach on the Metro Blue Line. This could indicate a lack of travel demand between Pasadena and Long Beach.

Downtown-bound Metro Blue Line and Metro Expo Line trains will merge onto a single set of tracks at Washington Blvd. and Flower St. and travel along the existing Flower St. right-of-way to 7th St./Metro Center Station. Trains would then continue along the Regional Connector to Little Tokyo where the lines would again split, with Metro Blue Line trains

continuing to Union Station and Pasadena, and Metro Expo Line trains traveling to East Los Angeles. If Long Beach-Pasadena service and East Los Angeles-Culver City service each operate with 5-minute peak hour headways, the Regional Connector tracks would see trains every 2 ½ minutes in each direction. This means that any at-grade intersections would see trains approximately every 75 seconds, or one to two trains per signal cycle.

The Regional Connector would allow for more efficient train maintenance, as it would link the Metro Gold Line and Metro Blue Line maintenance facilities via new LRT track. Because the Metro Gold Line has only a light-duty maintenance yard, trains must currently be loaded onto trucks and driven to the Metro Blue Line yard in Long Beach when they require major services. The Regional Connector would allow Metro Gold Line trains to simply deadhead to Long Beach along the service tracks, eliminating the need for costly trucking and expediting their arrival to the yard.

In addition, connecting the LRT lines as a single network enables vehicles to be stored and operated on multiple lines. Currently, storage surplus on one LRT network is not available to the other network. The Regional Connector would make centralized vehicle maintenance and storage facility serving the entire network possible.

1.8.2 Transit Usage

As the largest employment center in Los Angeles County, there are unique opportunities in the PSA for residents to live near their jobs in an area with dense transit service. While the Regional Connector would not extend rail transit service into previously un-served regions of the County, it will broaden coverage within downtown Los Angeles and speed rail trips through the area by eliminating transfers. Both of these improvements would result in time savings; new stations mean shorter walking distances for many current passengers and fewer transfers mean less time spent waiting for trains and buses.

The ridership benefits of increasing trip speeds have been demonstrated in Los Angeles by the Metro Rapid program. The 2002 Demonstration Program Final Report noted that the implementation of the rapid bus service led to 23-29 percent improvement in trip speeds, an increase from 9mph to 12mph. While this difference may seem small, ridership on the Wilshire/Whittier corridor increased by 42 percent as a result. The other demonstration corridor, Ventura Blvd., experienced a ridership increase of 27 percent.

The Regional Connector is expected to result in similar increases in ridership among Metro Blue Line and Gold Line passengers. The transfer between the Red/Purple and Blue Lines at 7th St./Metro Center can currently take one to five minutes during peak hours, three to ten minutes during off-peak hours, and five to eight minutes on weekends. The transfer between the Metro Red or Purple Line and Gold Lines at Union Station takes three to eight minutes during peak hours, five minutes during off-peak hours, and five minutes on weekends.

By eliminating these transfers, assuming speeds similar to the Metro Red Line, the Regional Connector could reduce travel times by:

- five to 13 minutes during peak times,
- eight minutes during off-peak times, and
- eight minutes on weekends.

1.8.3 Regional Population and Employment Growth

Much of the greater Los Angeles metropolitan area consists of fairly dense populations which are expected to grow by the year 2030. Figures 1-16 and 1-17 show the regional population densities in 2005 and the 2030 projection, respectively. In 2005, areas of highest population density were found in Central Los Angeles, Hollywood, Southgate, East Los Angeles, and the Westside.

Population densities will increase throughout the region, particularly in those with already-high density. Significant increases in density will develop in the South Bay and the Eastside, particularly along the I-10 corridor.

Areas of high population density tend to have workers who need to travel to employment centers throughout the region. Figures 1-18 and 1-19 show the regional employment densities in 2005 and projected in 2030, respectively.

In 2005, the highest employment densities overlapped the PSA in Central Los Angeles. Areas of moderate employment density included Westwood, Santa Monica, Hollywood, Culver City, Pasadena, the South Bay and East Los Angeles. Employment densities are expected to increase in census tracks around these employment centers. The improvement of transit services in downtown will help bring workers from areas of higher population density and lower employment density to the PSA, where the highest concentration of employment opportunities is located. The Regional Connector will also improve access to areas of moderate employment density by eliminating transfers and reducing travel time for commuters.

Current transit usage in the region is the highest in Central Los Angeles, with additional areas of moderate transit usage in the Westside, Hollywood, Pasadena, the South Bay, and Pasadena, as shown in Figure 1-20. Transit usage is projected to increase in these areas by 2030, as shown in Figure 1-21. The highest transit usage areas are found along the existing Metro Red Line and Metro Purple Line corridors. There is also high transit usage in the Westside area where there are many students who are reliant on public transportation.

Additional transit opportunities created by the Regional Connector for commuters on the Metro Blue and Gold lines are expected to increase the number of trips along the corridors of both. The Regional Connector will alleviate congestion on the already heavily-used Metro Red and Purple Lines by eliminating the need for Metro Blue and Gold line commuters to transfer through them.

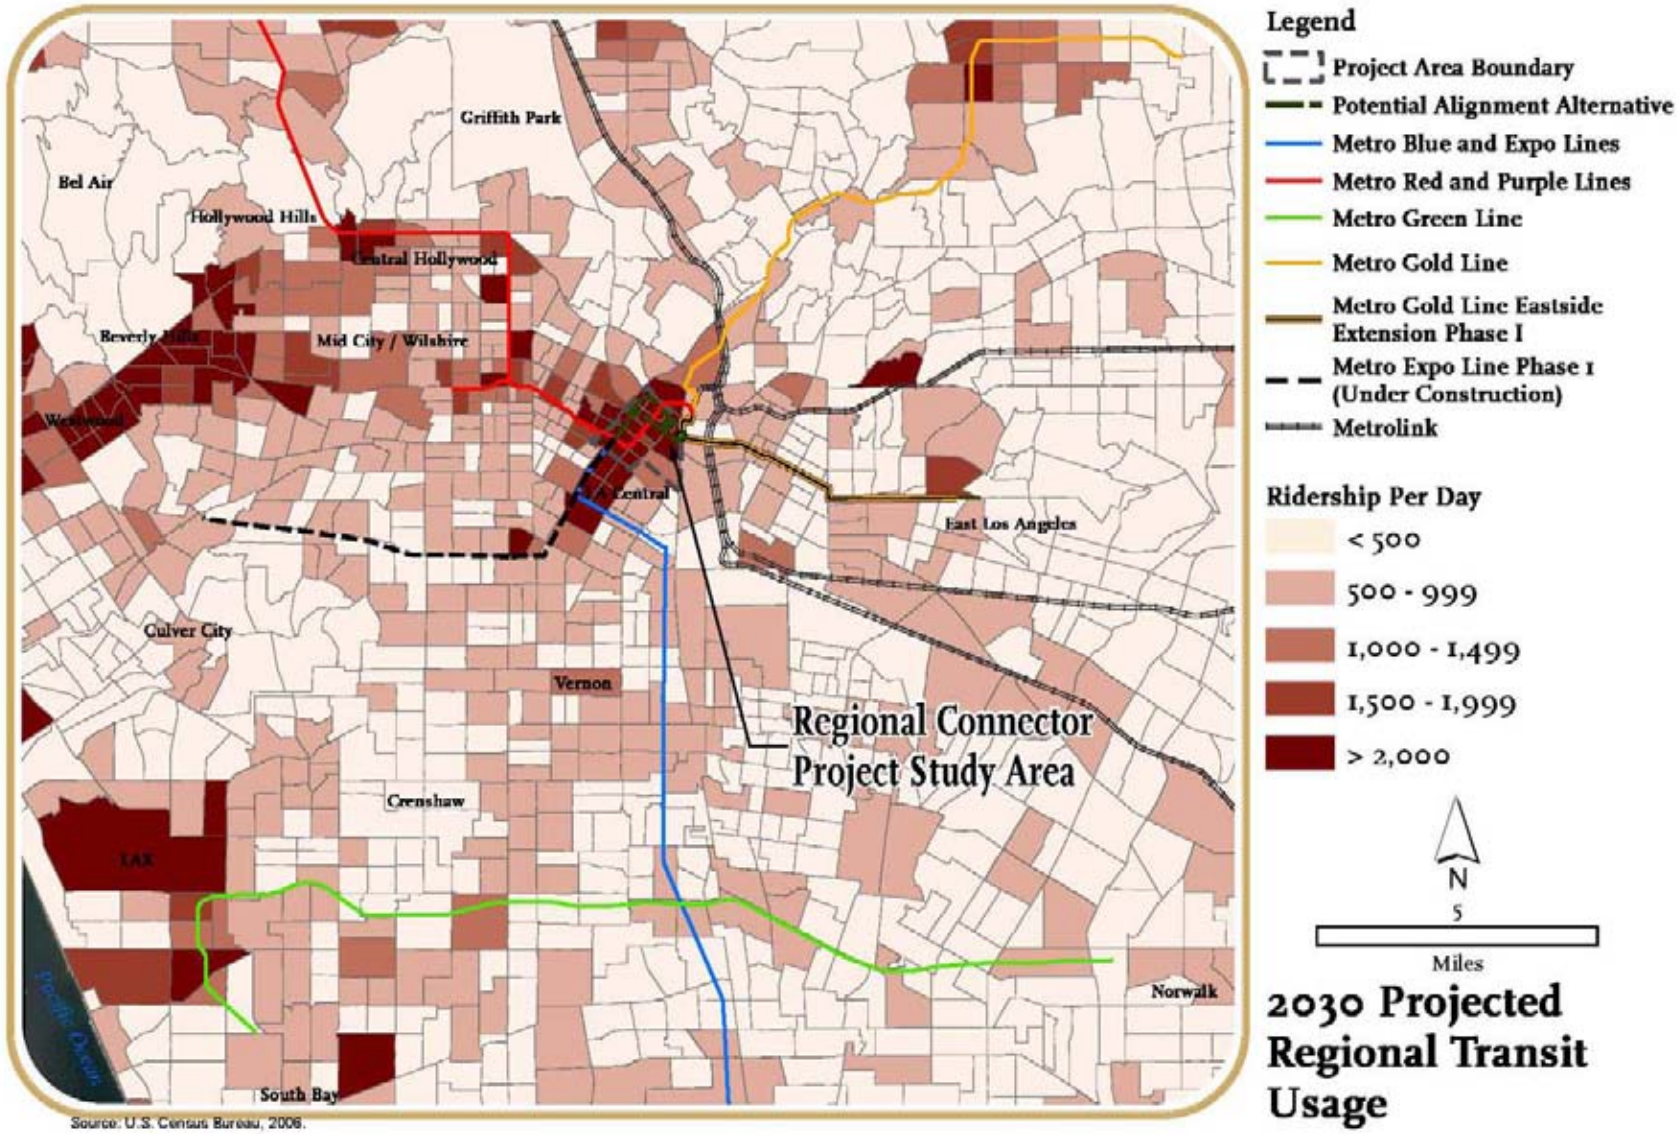

Figure 1-20 2030 Regional Transit Usage

1.8.4 Significant Transit-Dependent Populations in the Project Study Area

The PSA can be characterized as more transit-dependent than the County as a whole because of its dense population, proportionately low income levels, number of households with zero vehicles, and public transportation users. A significant portion of the County's transit riders live and/or work within the PSA; this is projected to increase through 2030. Improvements in transit service would help to mitigate impacts associated with the increased concentration of transit-dependent communities in and around the Regional Connector PSA.

Population, Households, and Employment

Census tracts with the largest populations (greater than 2000 people) are found within the PSA east of Main St. between 1st St. and 7th St. and east of San Pedro St. between Temple St. and 1st St. According to SCAG projections, in 2030, slightly less growth is expected in the PSA compared to the whole County. The population in the PSA is expected to grow by about 18 percent from about 18,000 in 2005 to 21,000 people in 2030.

The largest growth in the PSA is projected in two locations:

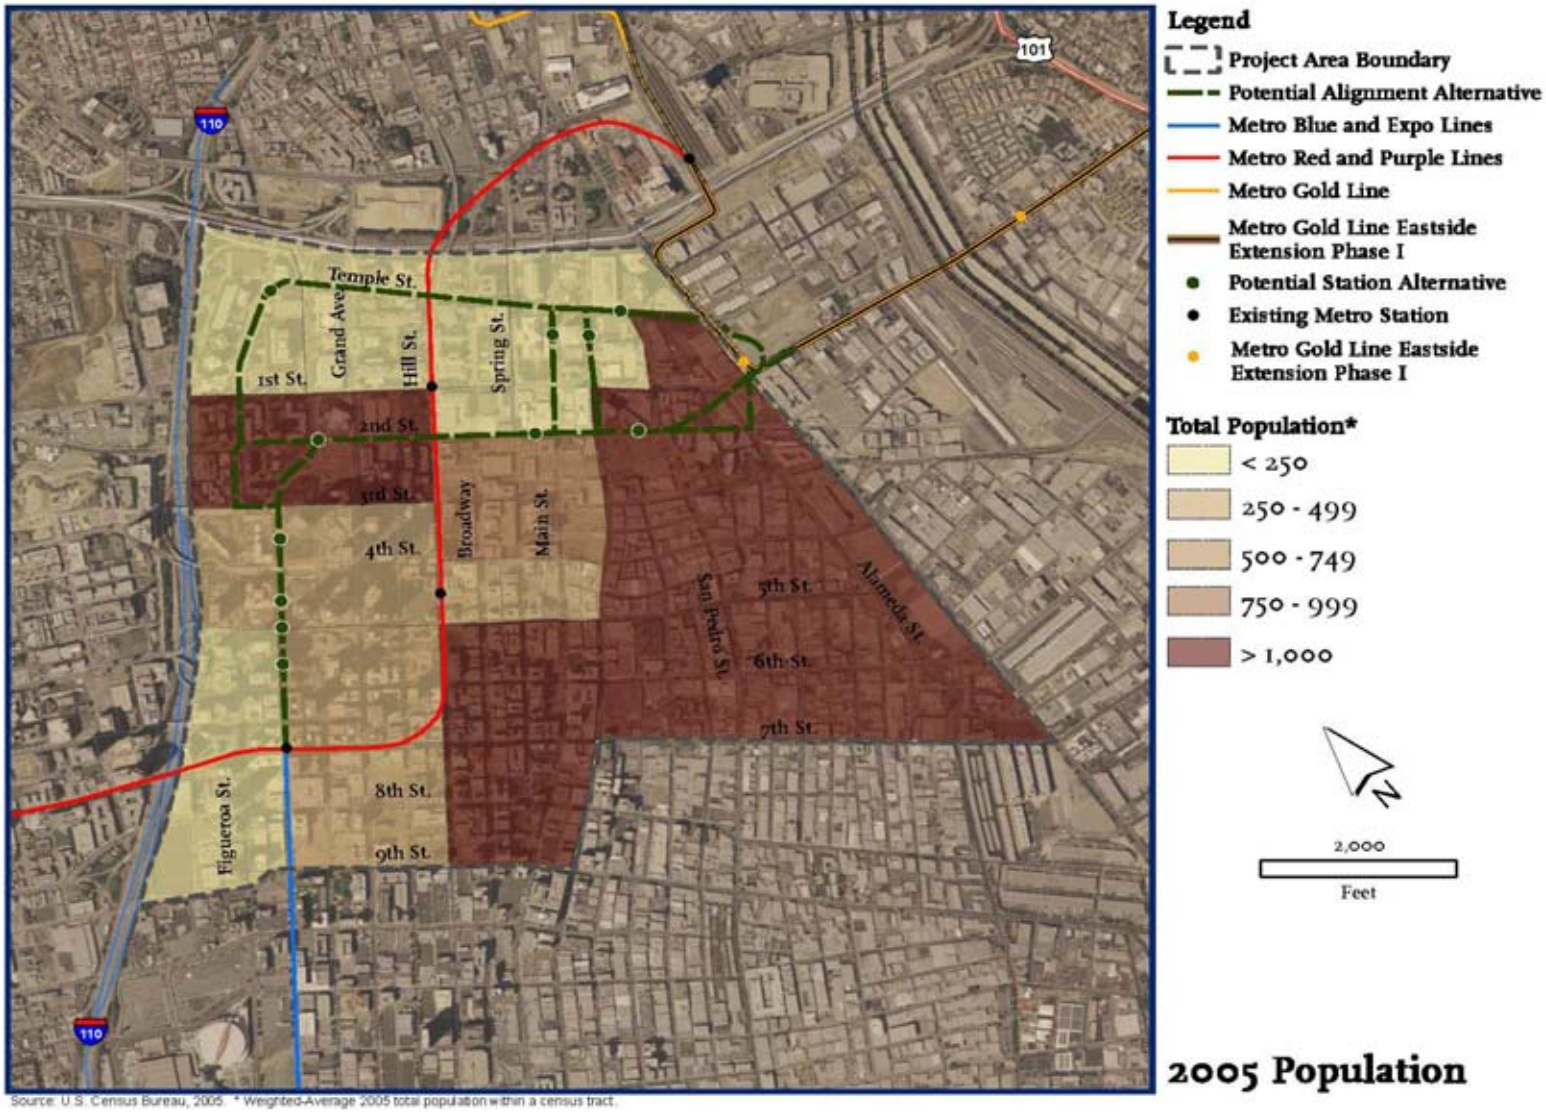
- the area bounded by SR-110, Hill St., 1st St., and 3rd St., which will increase from between 1,500 to 1,999 people to over 2,000 people; and
- the area bounded by Hill St., Main St., 7th St., and 9th St., which will increase from 1,000 to 1,499 people to 1,500 to 1,999 people.

Projected population is based on fairly conservative estimates made by SCAG in 2005. Figures 1-22 and 1-23 show the distribution of existing and projected total population within the PSA.

Several planned high-rise residential projects in the PSA contribute to the high level of expected growth. These include the Park Fifth condominium project at 5th and Hill Streets, the Block 8 condominium and rental project under construction between 2nd, 3rd, San Pedro, and Los Angeles Streets, and the 8th & Grand condominium and retail project at 8th St. and Grand Ave.

The total number of households are also projected to increase 27 percent from about 9,600 in 2005 to 12,200 in 2030, which is higher than the 25 percent projected for the County.

The employment base is projected to increase by about 12 percent from over 168,000 individuals in 2005 to over 188,000 in 2030. Current and projected employment within the PSA are both between three and four percent of total County employment.



Source: U.S. Census Bureau, 2005. * Weighted-Average 2005 total population within a census tract.

Figure 1-21 2005 Population in PSA

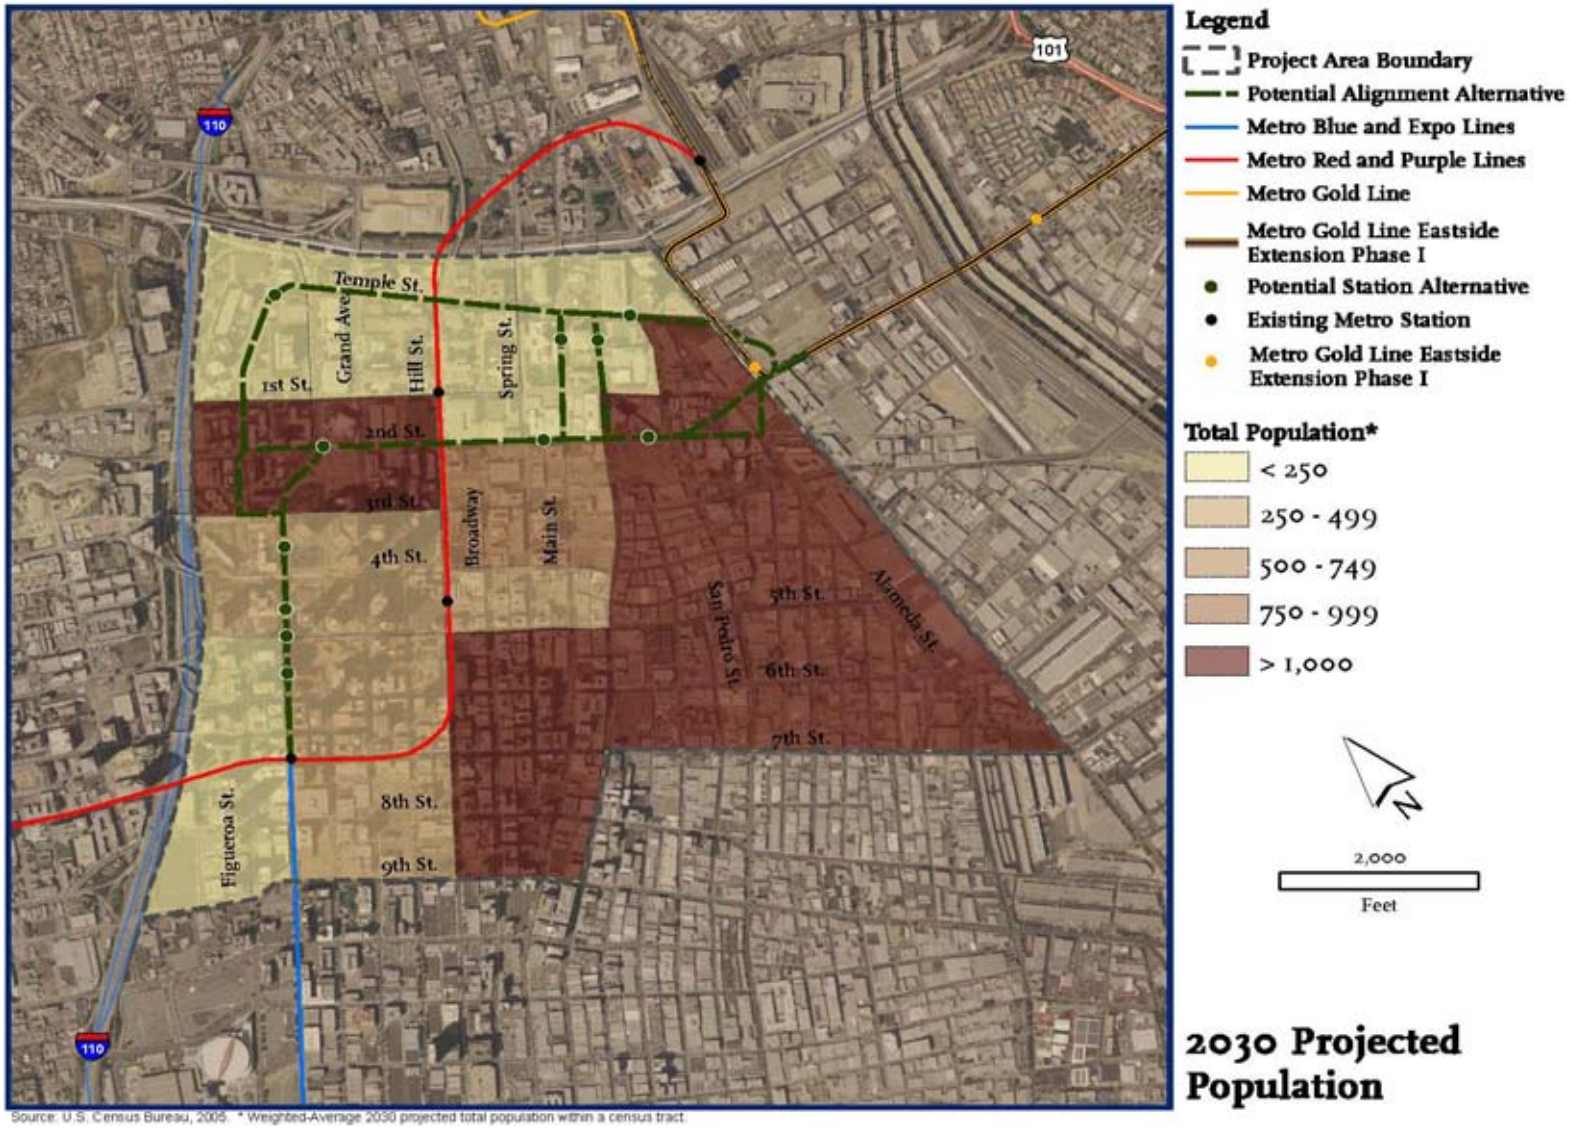


Figure 1-22 2030 Population in PSA

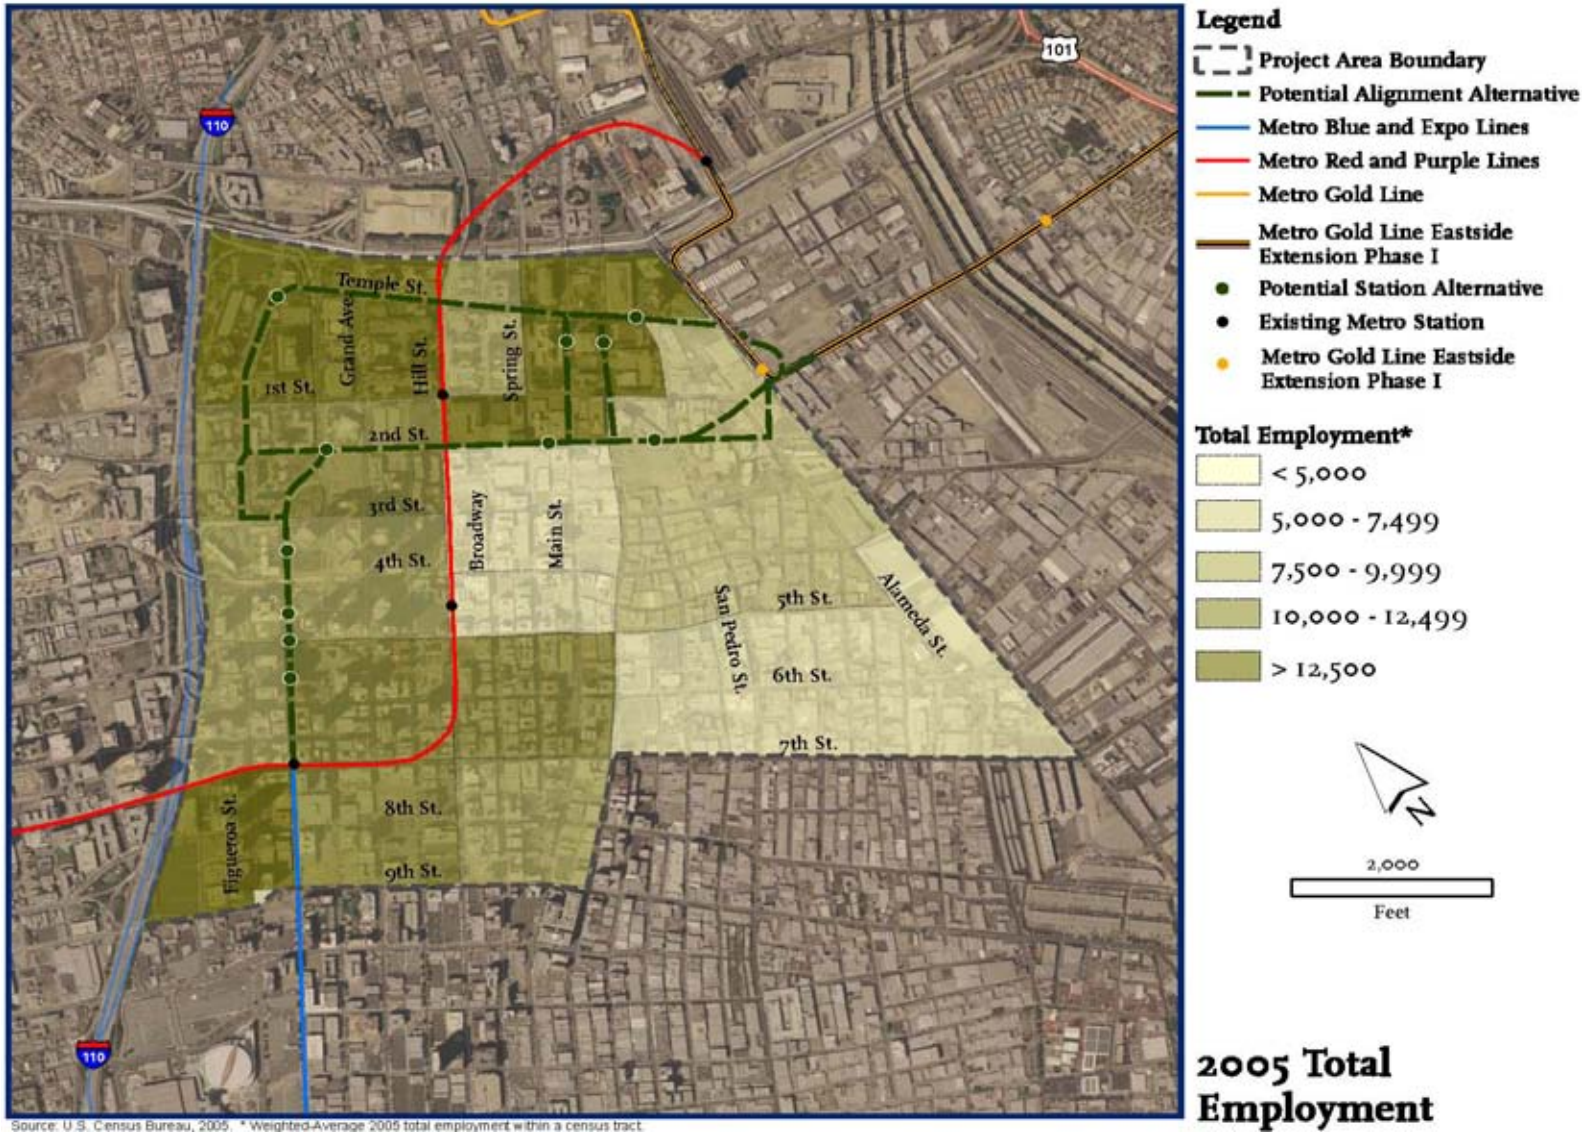

Figure 1-23 2005 Employment in PSA

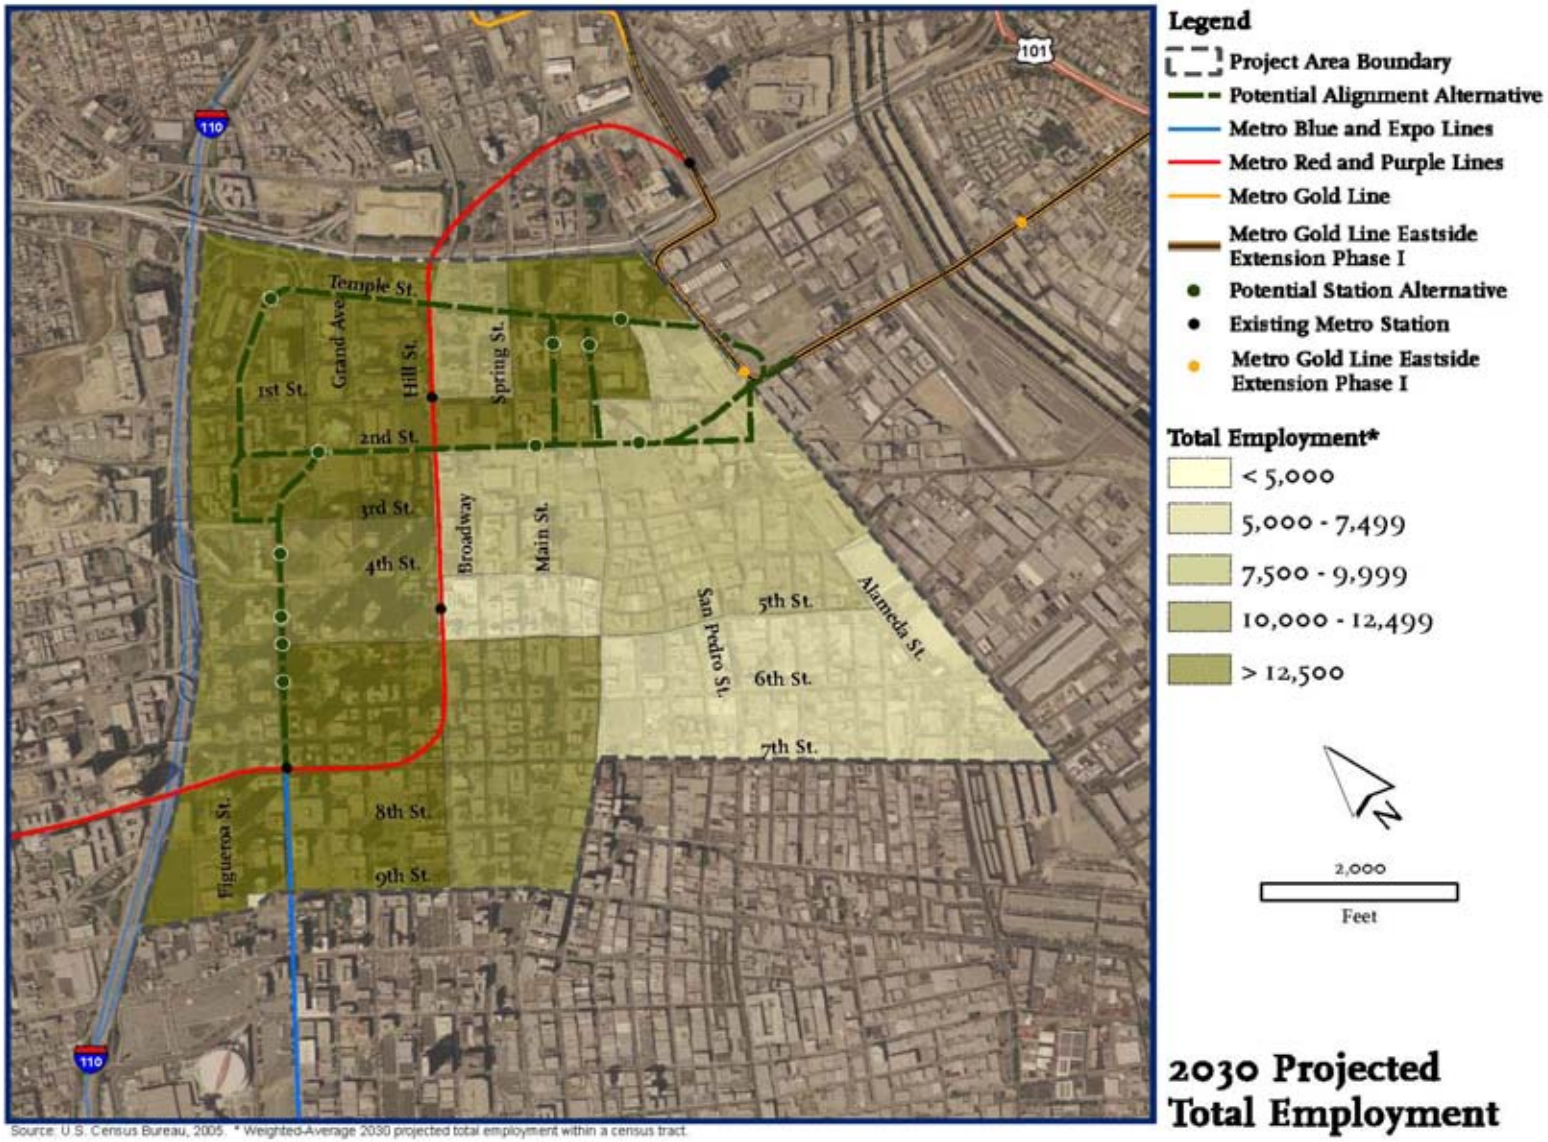

Figure 1-24 2030 Employment in PSA

Figure 1-24 shows the distribution of employment in the PSA in 2005. At that time, total employment in a majority of the census tracts within the PSA was over 5,000, with areas of highest concentration (greater than 12,500 jobs) in three locations:

- the area bounded by SR-110, Flower St., 7th St., and 9th St.;
- the area bounded by SR-110, Hill St.,US-101, and 1st St.; and
- part of the area bounded by Hill St., Alameda St., US-101, and 2nd St.

A large employment base indicates that a significant number of workers commute within, into, and out of the PSA. Figure 1-25 shows the projected distribution of employment in 2030.

Table 1-15 summarizes the PSA's projected growth in population, households and employment relative to the entire County.

Table 1-15 Population, Household, and Employment Growth

	2005	2030	Forecast Increase Between 2005-2030
Population			
PSA	17,795	20,738	16.5%
LA County	10,010,315	12,193,030	21.8%
PSA % of LA County	0.18%	0.17%	---
Households			
PSA	9,673	12,287	27.0%

Employment			
PSA	168,328	188,591	12.0%
LA County	4,644,010	5,651,043	21.7%
PSA % of LA County	3.62%	3.34%	---

Source: SCAG, 2005 data and 2030 projections

Household Income

Socioeconomic trends in the PSA are correlated to transit-dependent communities; household income is an important factor. In 2005, the PSA had about 7,000 low-income households, about 2,000 medium-income households, and only about 400 high-income households.

Low-income households include those households considered to be living in poverty. The US Census Bureau's defined 2005 poverty threshold as an annual average salary of $12,755 for a two-person household. Low-income households represented about 75 percent of the PSA's total households. The high proportion of low-income households underscores the need for public transit.

Figure 1-26 shows the distribution of low-income households in 2005. Census tracts within the PSA that have greater than 1,000 low-income households were:

- the area bounded by SR-110, Hill St., 1st St., and 3rd St.; and
- the area bounded by Hill St., Alameda St., 5th St., and 7th St.

Figure 1-27 shows the projected distribution of low income households in 2030. The number of low-income households is projected to increase by roughly 26 percent to about 9,000 in 2030.

Age Distribution

Demographic data are presented in 1.4 Demographics. Figure 1-28 shows the distribution of residents age 65 and over in the PSA. The senior population is highest west of Hill St. and south of 1st St. Figure 1-29 shows the distribution of residents age 18 and under in the PSA. The youth population is found primarily in the southern part of the PSA, south of 5th St.

Young and elderly residents within the PSA are more likely to depend on public transit because of inability to drive or lack of private vehicle accessibility.

Public Transportation Ridership and Vehicle Accessibility

Nearly 70 percent of the households in the PSA have no car. Figure 1-9 shows the distribution of households with no available vehicles.

Figure 1-30 shows the percentage of the employed population age 16 and over who lived in the PSA relied on public transportation in 2005. Twenty-three percent of employed residents age 16 and over rely on public transit for their commuting needs. Some of the PSA's transit-dependent population live within convenient walking distance (one-quarter to one-half mile) of the Regional Connector termini, while the rest will be able to easily access the Regional Connector with a bus or rail transfer. When comparing vehicle accessibility and public ridership patterns in the Regional Connector PSA, the trends suggest that even households in the PSA with one or more cars have a higher propensity to use public transportation than similar households elsewhere in the County.

There are also a large number of commuters from outside the PSA who utilize transit to get to employment and other opportunities within the PSA. As explained earlier in this section, they will benefit from the development of the Regional Connector.

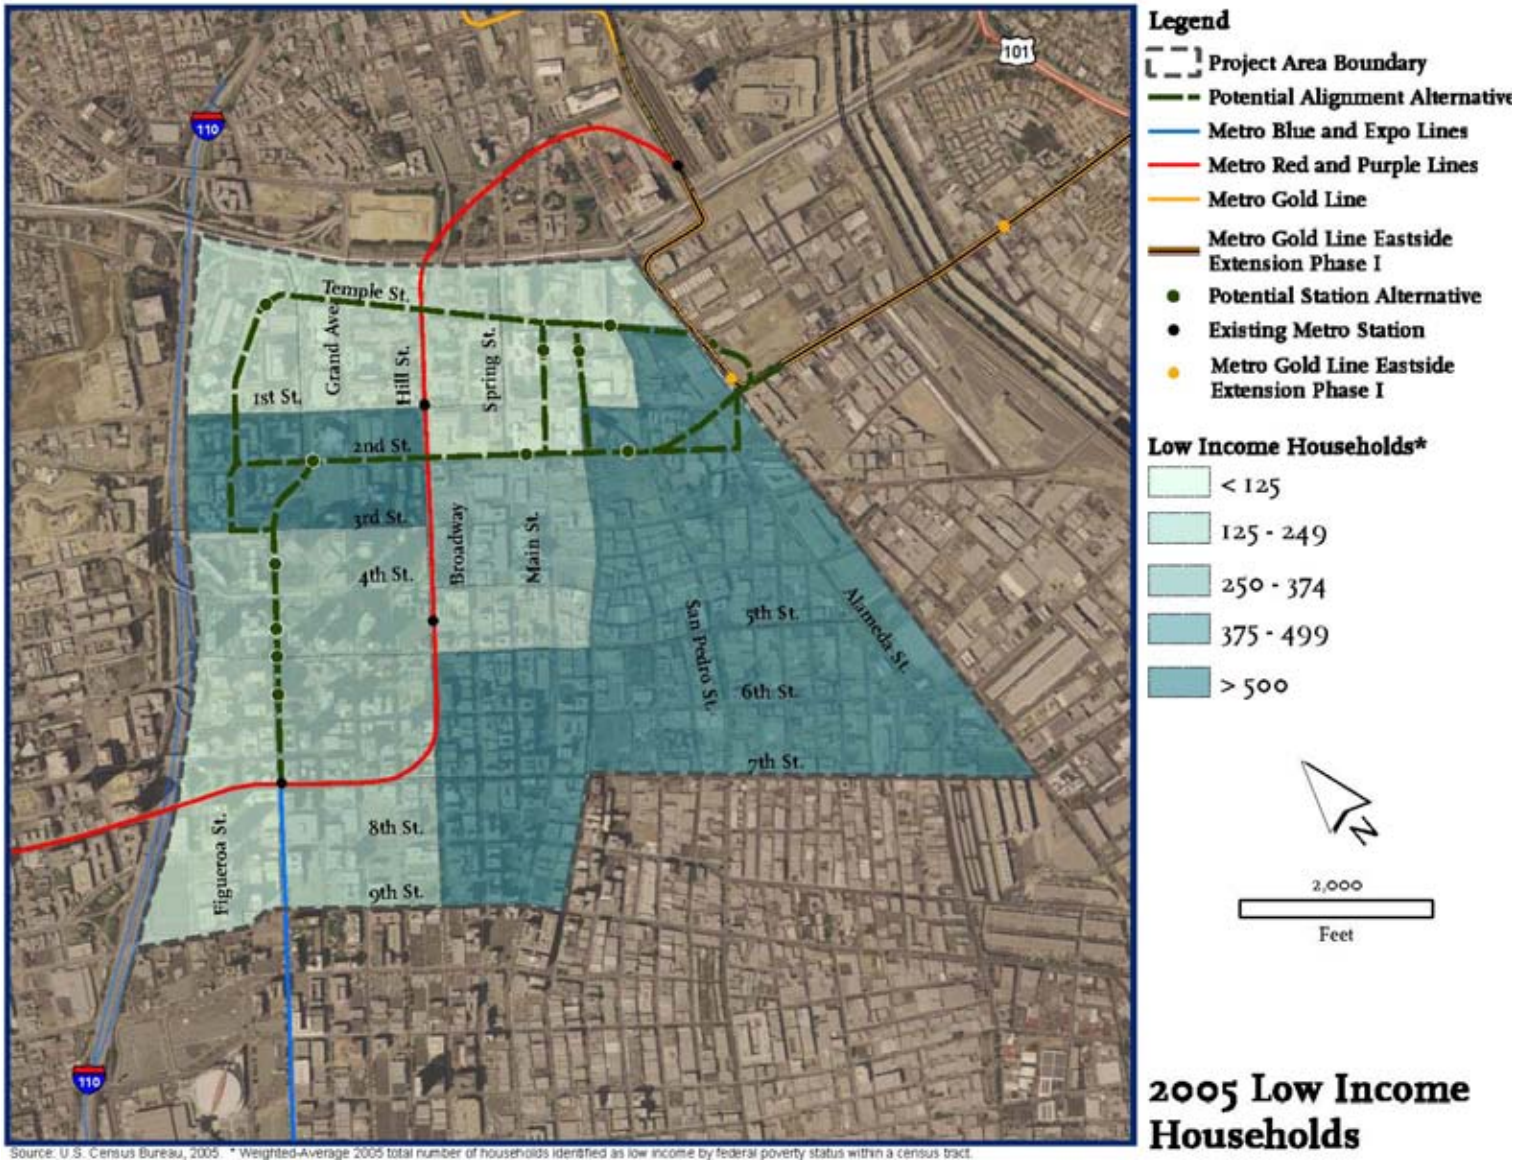

Figure 1-25 2005 Low Income Households

1.8.5 Project Study Area Population and Employment Growth

Providing public transportation to densely-populated areas can increase ridership by making transit more accessible to a larger population. Population and employment density data for the PSA are presented in 1.4 Project Study Area Demographics. The areas of highest population density are found in two locations within the PSA:

- the area bounded by 1st St., 3rd St., SR-110, and Hill St.; and
- the area south of 5th St. and east of Hill St.

Figure 1-31 shows the distribution of population densities in 2005.

The highest employment density exists in the PSA in the area bounded by US-101, 3rd St., SR-110, and Hill St. Figure 1-32 shows the distribution of employment densities in 2005.

Population and employment densities are projected to increase in the PSA in 2030. Average population density is projected to grow to roughly 13,600 persons per square mile, and average employment density is expected to be nearly 124,000 employees per square mile. Figures 1-33 and 1-34 show projected 2030 population and employment densities.

1.8.6 Travel Demand Justifies the Need for Transit Services

Traffic patterns in the PSA are discussed in 1.6 Performance of the Travel System. Table 1-17 presents traffic volumes within the PSA, illustrating the high volume of vehicles on the arterial network. These high volumes in concert with high pedestrian traffic result in blockages at many intersections within the PSA. The result is a strong and growing demand for a high-capacity transit alternative.

1.8.7 Local Land Use Policies and Guidelines that Support Transit

Recognizing the significant limitations on construction or expansion of roadways within the PSA, there is increased focus on increasing the use of public transit rather only making roadway improvements for personal vehicle travel.

County of Los Angeles General Plan

The County's General Plan establishes a number of goals and corresponding policies that support the development of public transit.

- Goal C-1: An accessible circulation system that ensures the mobility of people and goods throughout the County.
  - Policy C1.1: Expand the availability of transportation options throughout the County
  - Policy C1.2: Encourage a range of transportation services at both the regional and local levels, especially for transit dependent populations.
  - Policy C1.3: Secure an affordable countywide transportation system for all users.
  - Policy C1.4: Maintain transportation right-of-way corridors for future transportation.
- Goal C-2: An efficient circulation system that effectively utilizes and expands multi-modal transportation options.
  - Policy C2.1: Support the linking of regional transportation systems.
  - Policy C2.2: Expand transportation options throughout the County.

Downtown Design Guidelines

The Community Redevelopment Agency of the City of Los Angeles (CRA) has drafted design guidelines for all new developments within downtown Los Angeles. These guidelines provide incentives for residential development by complementing or modifying code requirements such as density limits. With the overall goal of creating a livable downtown, guidelines focus on providing the following:

- a broad range of housing types;
- accessible transportation with emphasis on walking, biking, and transit other than autos;
- shops and services within walking distance to housing;
- safe, visually-pleasing and walkable streets;
- parks and other gathering places near to shops and services; and
- public recreational open space within walking distance to home.

The guidelines set forth specific standards for design and construction, including use of sustainable materials and practices, preserving historically- and culturally-significant buildings, and supporting environmental and aesthetic resources. The guidelines ultimately call for developers to consider pedestrians and not cars in their design process. The objective is to create a cohesive transition along blocks while creating inviting and open spaces that encourage pedestrian traffic. As outlined above, increasing public transit options is one way to meet this objective.

Little Tokyo Planning & Design Guidelines

As a result of recent resurgence and popularity in the Little Tokyo district of downtown (see Figure 1-1 for a map), a set of design guidelines was created with the intent of encouraging individual expression and continuity of the surrounding environment through building and street design, while enhancing elements and aesthetics that are significant to the Japanese-American Community. In addition to the preservation of existing physical and cultural spaces, the guidelines identify specific standards for new developments and streetscapes in order to maintain continuity throughout. Street dedication requirements, such as those in place for new development east of Alameda St. between Temple St. and 1st St., promote pedestrian- and transit-friendly designs which support cohesiveness through the corridor while maintaining cultural integrity. This, in turn, will enhance pedestrian activity and increase the attractiveness of walking and transit use in the area.

CommuteSmart®

Metro provides services through CommuteSmart® to help people find alternatives to a single-person car commute such as carpooling, vanpooling, park-and-ride, and public transit. CommuteSmart® also assists employers to set up rideshare programs, create incentives for commuting, and perform ongoing assessments and training. Improvement

of public transit options while promoting the use of public transit would increase ridership more than either done alone.

1.9 Potential Transit Markets

Potential transit markets are two-fold for the Regional Connector:

- the activity centers and major destinations that include public and private uses, density of population and employment, and major travel patterns that traverse the PSA;
- travel patterns through the PSA, since the Regional Connector would link over 50 miles of Metro LRT service from Pasadena to Long Beach, and from Culver City to the Eastside and everywhere in between.

This AA will result in projections of ridership generated by people moving within the PSA and through the PSA to get to and from homes, jobs, services, and entertainment.

Key advantages for the Regional Connector presented by the PSA are the easy bus connections provided by the dense transit network, convenient regional and intercity rail interface, and the location of activities and services within walking and biking distance of each other.

1.9.1 Activity Centers and Destinations

Several activity centers exist within the PSA. These include Educational, Recreational, Business/Industrial and Commercial centers. Figure 1-35 illustrates activity centers within the PSA.

Downtown has long been considered a major destination for employment and services; it is experiencing a resurgence as a center for entertainment and the arts, and increasingly, residential living.

Bunker Hill

The Bunker Hill District is located generally between First St. on the north, Hill St. on the east, Third St. on the south, and Figueroa St. on the west. Major downtown destinations located within Bunker Hill include the Walt Disney Concert Hall, Museum of Contemporary Art (MOCA) and several high-rise office towers, senior and market-rate housing, hotels and commercial/retail centers. Bunker Hill offers over 3,200 residential units mainly in mid- and high-rise buildings.

Large development projects planned for this area include Civic Park and the Grand Avenue Development Project, which will transform this area into a regional arts, entertainment, and residential destination. The Grand Avenue Development is a $3 billion project that includes 3.6 million square feet of development with 449,000 square feet of retail. It is currently planned for 2,600 housing units, almost doubling the existing number of units in the area.

Civic Center

Bordering Bunker Hill to the northeast is the Civic Center, which serves as a hub for City, County, State, and Federal government with the second-largest concentration of civic buildings in the country. The Cathedral of Our Lady of the Angels, the Ahmanson Theater, Mark Taper Forum, and the Dorothy Chandler Pavilion are other major destinations in this district.

Civic Center is undergoing active redevelopment. The new headquarters for the state Department of Transportation (Caltrans) District 7 has recently been completed, development of the new Los Angeles Police Department Headquarters is underway, and construction of a U.S. Federal Courthouse is soon to begin.

Little Tokyo

East of Civic Center is Little Tokyo, which serves as the center of the largest Japanese-American community in the continental United States. The Japanese American National Museum and The Geffen Contemporary at MOCA are located here, along with a lively shopping district.

The popularity of Little Tokyo is evidenced by the active residential development underway, with recently completed and current projects adding more than 2,000 residential units. Significant developments in the early planning stages include a 4.5-acre site adjacent to the Little Tokyo Arts District Station of the Metro Gold Line. Early concepts from developers identified high-density combination of office and housing with strong connections to the adjacent Metro Gold Line Eastside Expansion.

Toy District

The Toy District is a 12-block shopping area with over 500 retail businesses located south of Little Tokyo and north of Central City East. Development here is centered on mixed-use. The proposed Medallion building, one of several projects currently under construction, will provide 192 residential lofts and over 200,000 square feet of retail space.

Financial Core

The Financial Core District is located south of Bunker Hill and is dominated by high-rise office buildings. The Central Library, built in 1926, destroyed by fire in 1986, and rebuilt, expanded, and re-opened in 1993 is located here. Other landmarks in this district include the Millennium Biltmore Hotel (built in 1923) and Pershing Square (dating back as far as 1866 as a park).

The proposed 2.7-million square-foot, four-phase Metropolis mixed-use development will be located in the southwestern end of the Financial District. Phase I of this project, which began construction in 2008, will provide 360 residential units. Park Fifth is another major planned 76-story high-rise development across from Pershing Square and will include over 700 condos and a 200-room hotel.

Historic Core

To the east of the Financial Core is the Historic Core District, containing a large concentration of historic and architecturally-significant buildings, including the Bradbury Building (built in 1893). The Grand Central Market (dating back to 1917 as an open-air market) and the Broadway Historic Theater District (with theaters dating back to the early 1900s) are destinations in this district.

Development here is focused on conversion of old neglected buildings into lofts and apartments. The Historic Core experiences high volume retail sales on Broadway St., which is a largely sidewalk-oriented retail district. Due to the shortage of parking in the area, the retail district is reliant on public transit to bring patrons to the neighborhood.

Jewelry District

The largest jewelry district in the U.S. and second largest in the world is located southwest of the Historic Core, where 5,000 businesses generate billions of dollars in revenue.

Development in this area includes the proposed construction of 875 condominium units at 8th St. and Grand Ave. Like the Historic Core, parking is in short supply and the district attracts a high volume of retail sales.

Central City East

The Central City East District is located south of the Toy District and consists primarily of commercial uses, including wholesale buildings and warehouses. The Flower Market, produce, fish and food processing industries as well as import/export businesses employ nearly 20,000 people in this area. Housing in this district consists mainly of the 6,500 single-room occupancy hotel units. This area is also important in providing social services, including alcohol treatment, mental health services, and job training.

Outside of the Project Study Area

Other important downtown development projects outside of the PSA include the recently-opened LA Live, a 4-million square foot complex of retail, restaurants, office, theater, hotel, parking, and residential space adjacent to the Staples Center.

Regional Activity Centers and Destinations

Due to the improved linkages provided by the Regional Connector, LRT will be enhanced throughout the region thereby attracting new ridership on existing lines.

Key regional activity centers that will attract riders to ride seamlessly through the PSA to get destinations that, today, require more than one transfer, include:

- University of Southern California via Metro Expo Line
- Los Angeles Trade Technical College via Metro Blue Line
- Downtown Long Beach via Metro Blue Line

- Downtown Culver City via Metro Expo Line
- Crenshaw District via Metro Expo Line
- Downtown Pasadena via Metro Gold Line
- Old Town Pasadena via Metro Gold Line
- South Pasadena via Metro Gold Line
- Chinatown via Metro Gold Line
- City of Compton via Metro Blue Line
- Highland Park via Metro Gold Line
- Boyle Heights via Metro Gold Line Eastside Extension
- Arts District via Metro Gold Line Eastside Extension
- East Los Angeles Civic Center via Metro Gold Line Eastside Extension
- East Los Angeles College via Metro Gold Line Eastside Extension
- Los Angeles Coliseum via Metro Expo Line
- Los Angeles County Museum of Natural History via Metro Expo Line
- Watts via Metro Blue Line

1.9.2 Local Redevelopment Plans and Transit Improvements

Many of the communities in the PSA are focusing on redevelopment projects to meet increasing residential and commercial demands. Several large commercial centers or mixed-use developments have been identified within the PSA. These centers are typically ideal locations for public transit services due to the large number of patrons and opportunity to alleviate inbound and outbound traffic congestion.

Following are some of the current CRA projects in the PSA:

- 2nd St. Connection – This project, financed mostly by Metro and Surface Transportation Program-Local funds, will complete Upper 2nd St. between Grand Ave. and Olive St. Construction on the connection is underway.
- Bunker Hill Design for Development – This project would amend the 1971 Design for Development (DFD) and increase the maximum floor area ratio in the Bunker Hill Redevelopment Area from 5.0 to 6.0. This would in turn allow 20 percent more square footage than the current DFD. The project is currently in the Environmental Impact Report (EIR) phase.

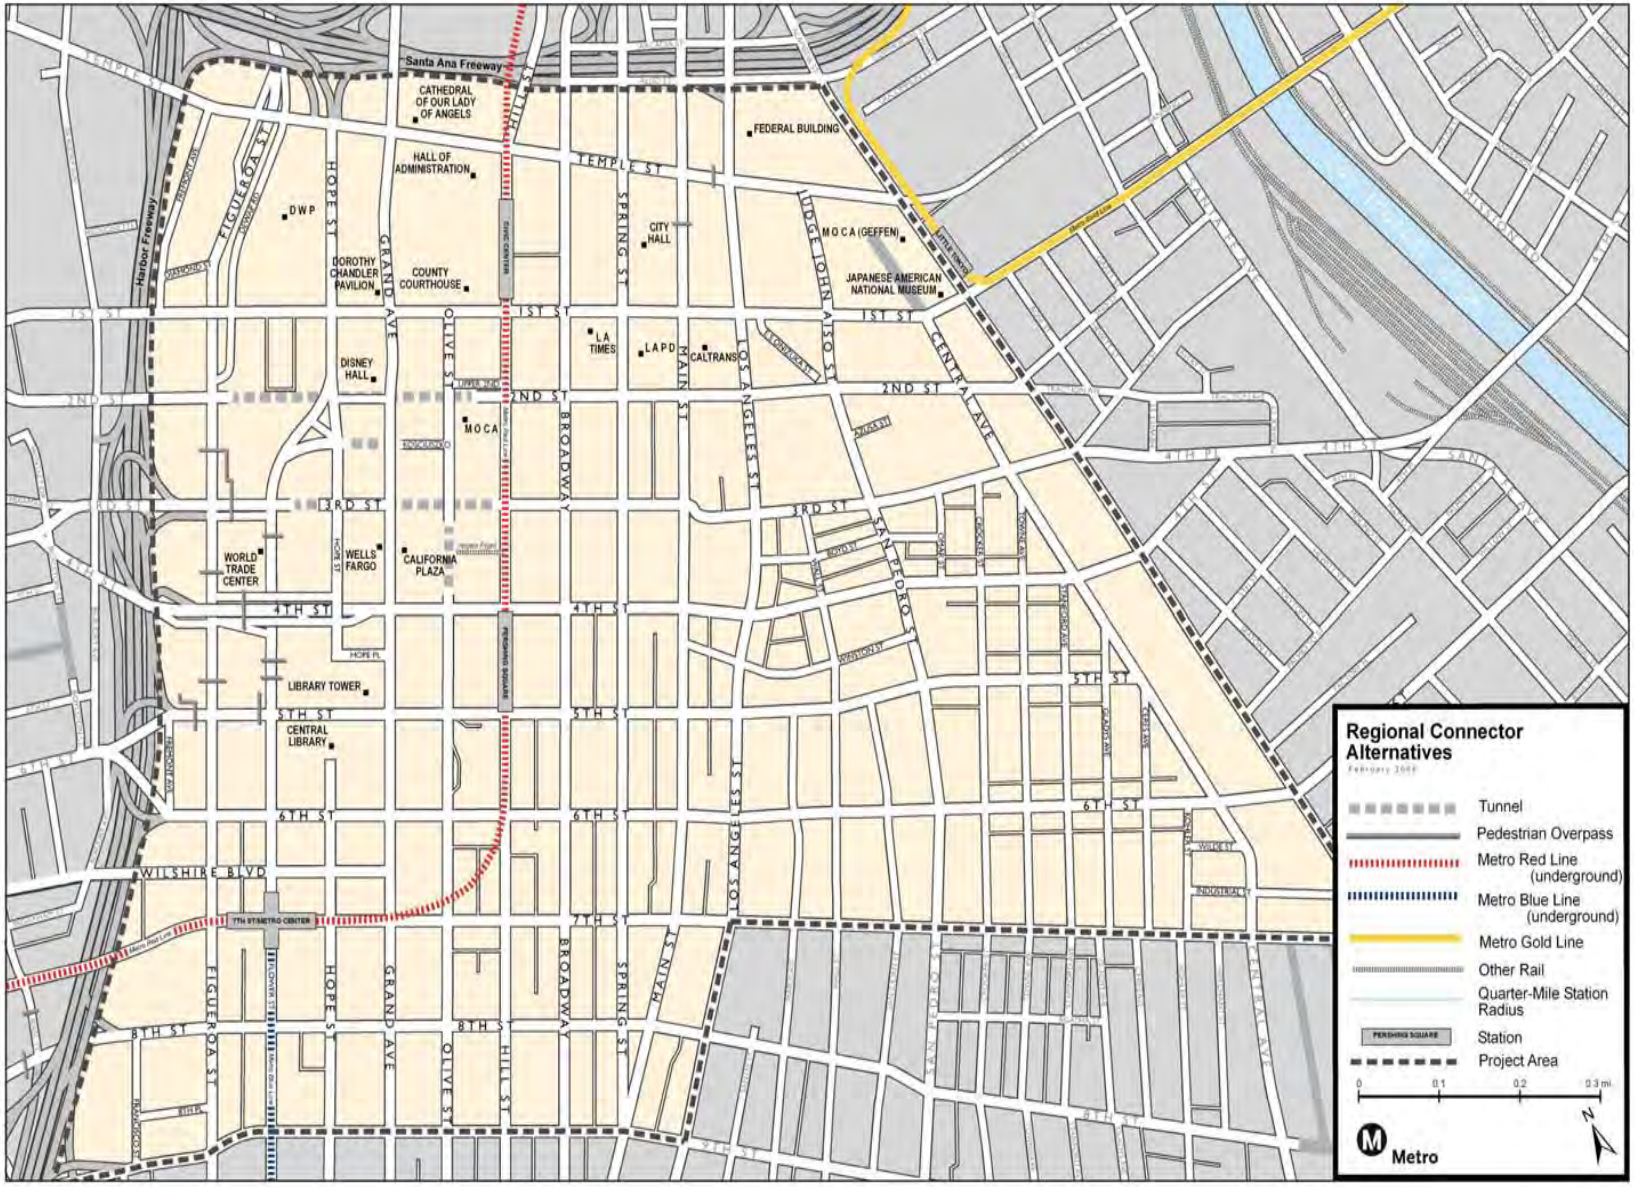

Figure 1-34 Activity Centers within PSA

- Grand Avenue Project – This project consists of a full-scale redesign of Grand Ave. as well as the addition of a 16-acre park in the Civic Center and 3.9 million square feet of retail, hotel, and office space.

- Parcel Y-1 Development – Under this plan, the existing Angels' Knoll Park will be developed into a third California Plaza office tower, potentially with retail and residential space. The project is currently in the DFD and EIR phase.

- Los Angeles Sports and Entertainment District/L.A. Live! – Large portions of this project are open as of this writing, but some are still under development. This project creates a major sports and entertainment destination just south of the Financial District, surrounding the existing Los Angeles Convention Center and Staples Center. Additional auditoriums and theaters, as well as retail and office space, will be added by the end of 2009. Condominium and rental apartment buildings are presently under construction. This redevelopment project is located one block south of the PSA, within one-quarter mile of the Pico Ave. on the Metro Blue and Expo Lines. The Regional Connector LRT alternatives directly connect the Metro Gold Line and Eastside Expansion lines to the complex.

- Park Fifth – An EIR is currently being prepared for a new high-rise residential building on 5th St. between Hill and Olive Streets, proposed as the tallest U.S. residential structure west of Chicago. The project will contain market-rate condominium units, a five-star hotel, and ground floor commercial space.

- 8th & Grand – This is a condominium project with ground floor restaurants and retail located on 8th St. between Grand Ave. and Olive St. The project was approved by the CRA Board and the City Council in 2006.

- Mangrove Site – CRA issued a request for proposals which closed in late 2007 for the parcel adjoining the future Metro Gold Line Little Tokyo/Arts District Station at 1st and Alameda Streets. CRA hopes to pursue a mixed-use project on the site with market rate and affordable residential units, commercial space, and public parking. The site is located east across Alameda St. from the PSA.

- Block 8 Mixed Use – This parcel in Little Tokyo is located between 2nd, 3rd, San Pedro, and Los Angeles Streets. The proposed development will include affordable rental units, market-rate condominium and rental units, commercial space, and open space. The site plan includes a mid-block walkway between San Pedro and Los Angeles Streets and is currently under construction.

- Metropolis Project – Located on the southwest corner of 8th and Francisco Streets, this recently-approved development will add 2.8 million square feet of new condominium, office, hotel, and retail space.

- Little Tokyo Central Avenue Art Park – This project involves redeveloping the closed section of Central Ave. between Temple and 1st Streets into a landscaped community park and underground parking facility linking the existing MOCA, The Japanese American National Museum, and Go For Broke monument.

- The Medallion – This project seeks to replace a surface parking lot with market-rate apartments and commercial space on a site located between Main, Los Angeles, 3rd, and 4th Streets. Construction on Phase 1 of the project has begun, and Phase 2 relies on the demolition of the existing Downtown Women's Center (see next project).

- Downtown Women's Center Relocation/Expansion – This project will remove the existing Downtown Women's Center on San Pedro St. between 4th and 5th Streets in order to make way for The Medallion. The City will renovate its Renaissance Building as the new Women's Center, and will provide an additional 75 permanent housing units and eight day rest beds for homeless women. CRA is currently reviewing development plans for the relocation/expansion project.

- Residential Hotels Rehabilitation Program – Under this plan, CRA will acquire approximately 30 single-room occupancy hotels, lease them to non-profit housing operators, and preserve the units as low-income housing. CRA cites public ownership as a means of cleaning up crime-ridden slum hotel areas within the PSA.

Additionally, CRA is preparing development plans for the Central Industrial District, located in the southeast portion of the PSA. The City does not have any Specific Plan areas within the PSA; however there are three in the downtown area that border the PSA:

- Alameda District (North of the PSA) covers Union Station and the surrounding parcels.

- Los Angeles Sports and Entertainment District (South of the PSA) includes the L.A. Live development, Staples Center, the Convention Center, and surrounding parcels slated for high-density development.

- Central City West (West of the PSA) covers the area immediately west of the 110 freeway.

1.9.3 Air Quality and Environmental Sustainability

The City is one of the most congested metropolitan areas in the nation and has been designated as a federal non-attainment area for air quality. The growing concern over global climate change and poor air quality is a predominant concern for Southern California. The use of fossil fuels for transportation generates large amounts of carbon dioxide (a greenhouse gas) emissions, which continue to disrupt progress toward improved air quality. Vehicle-related emissions account for over one-third of all air pollutants in the County.[5]

[5] SCAG 2006 State of the Region Report Executive Summary

During the 1990s, the County saw a significant increase in transit use. In 2002, SCAG reported that the City ranked 7th in the nation in public transit usage.[6] These changes are due in large part to investments in the regional public transportation system.

Investments in public transportation can contribute to alleviating the air quality challenges faced by the region and mitigating the negative effects suffered by Southern California residents. The Regional Connector will contribute to improved mobility by increasing the speed and convenience of the rail system, thereby providing a more viable alternative to the automobile. As a result, projected degradation of air quality will be reduced (at a minimum) or reversed (at a maximum) through reduced automobile-related greenhouse gas emissions in the region.

1.9.4 Travel Demand and Patterns

Historic growth patterns have resulted in a multi-centered region with multiple transportation corridors converging in the PSA. The transportation network includes 9,000 lane-miles of freeway, more than 42,000 lane-miles of arterials, and several large public transit service providers.[7] Yet growth of the transportation system has not kept pace with population growth and increases in transportation demand. As the population in the region doubled from 1960 to 2000, highway miles increased by less than 30 percent.[8] The congestion caused by insufficient transportation lanes affects both personal travel and goods movement. The majority of the congestion is from travel on the highways and local arterial network regardless of transportation mode. If the current trend persists, travel delays are expected to rise to 5.4 million person hours by 2030, more than double currently experienced delays, which will deeply affect highway productivity.[9] Expanding the public transportation system will provide more choices for commuters and potentially reduce travel demand and patterns on major highway and arterial systems.

The PSA is at the central core of activity for the County. The PSA is ranked very high as a destination zone for people coming from outside of the PSA. For instance, over 50,000 daily trips (approximately 25 percent of external trip destinations) are made for work from the greater Eastside, to Central Los Angeles. The CBD is also one of the top attractors of trips from the Westside. In 2006, of the more than 53,000 daily person trips from the PSA to other parts of Central Los Angeles, 11,000 were on public transit.

Among passengers riding on the Metro Gold Line from Pasadena to Union Station, nearly three-quarters transfer to the Metro Red Line for continued service into other parts of the City. Figures 1-36 and 1-37 illustrate travel patterns to and from the PSA.

[6] SCAG 2002 State of the Region Score Card
[7] SCAG 2004 RTP Chapter 2
[8] SCAG 2004 RTP Executive Summary
[9] SCAG 2004 Draft RTP PEIR

1.9.5 Summary of Public Transit Markets

The PSA is located in the crossroads of the region's transportation system because of historic development and population growth patterns. It contains the highest concentration of jobs in the County. Improving access to and through the PSA is a vital part of a larger strategy for meeting the economic, social, and environmental goals of the region.

Areas with large and growing populations represent a large public transit market because of high travel demands on already-congested public transit, roads, and freeways. As described in Section 1.8.4, the total population in the PSA is projected to increase by almost 25 percent by 2030, increasing the population density. High population densities can increase potential ridership on public transit.

Increasing economic development and employment opportunities in the PSA also increases the size of the public transit market. Employment is expected to increase by about 15 percent by 2030. This will increase demands for public transit from commuters wishing to avoid travel in private vehicles during peak traffic hours on roads and freeways.

Improving public transit connectivity in the PSA offers opportunities to increase ridership through access to regional transit markets. Balanced local land use and transportation policies can reduce auto travel and support more pedestrian-friendly, mixed-use and transit-oriented developments throughout the region.

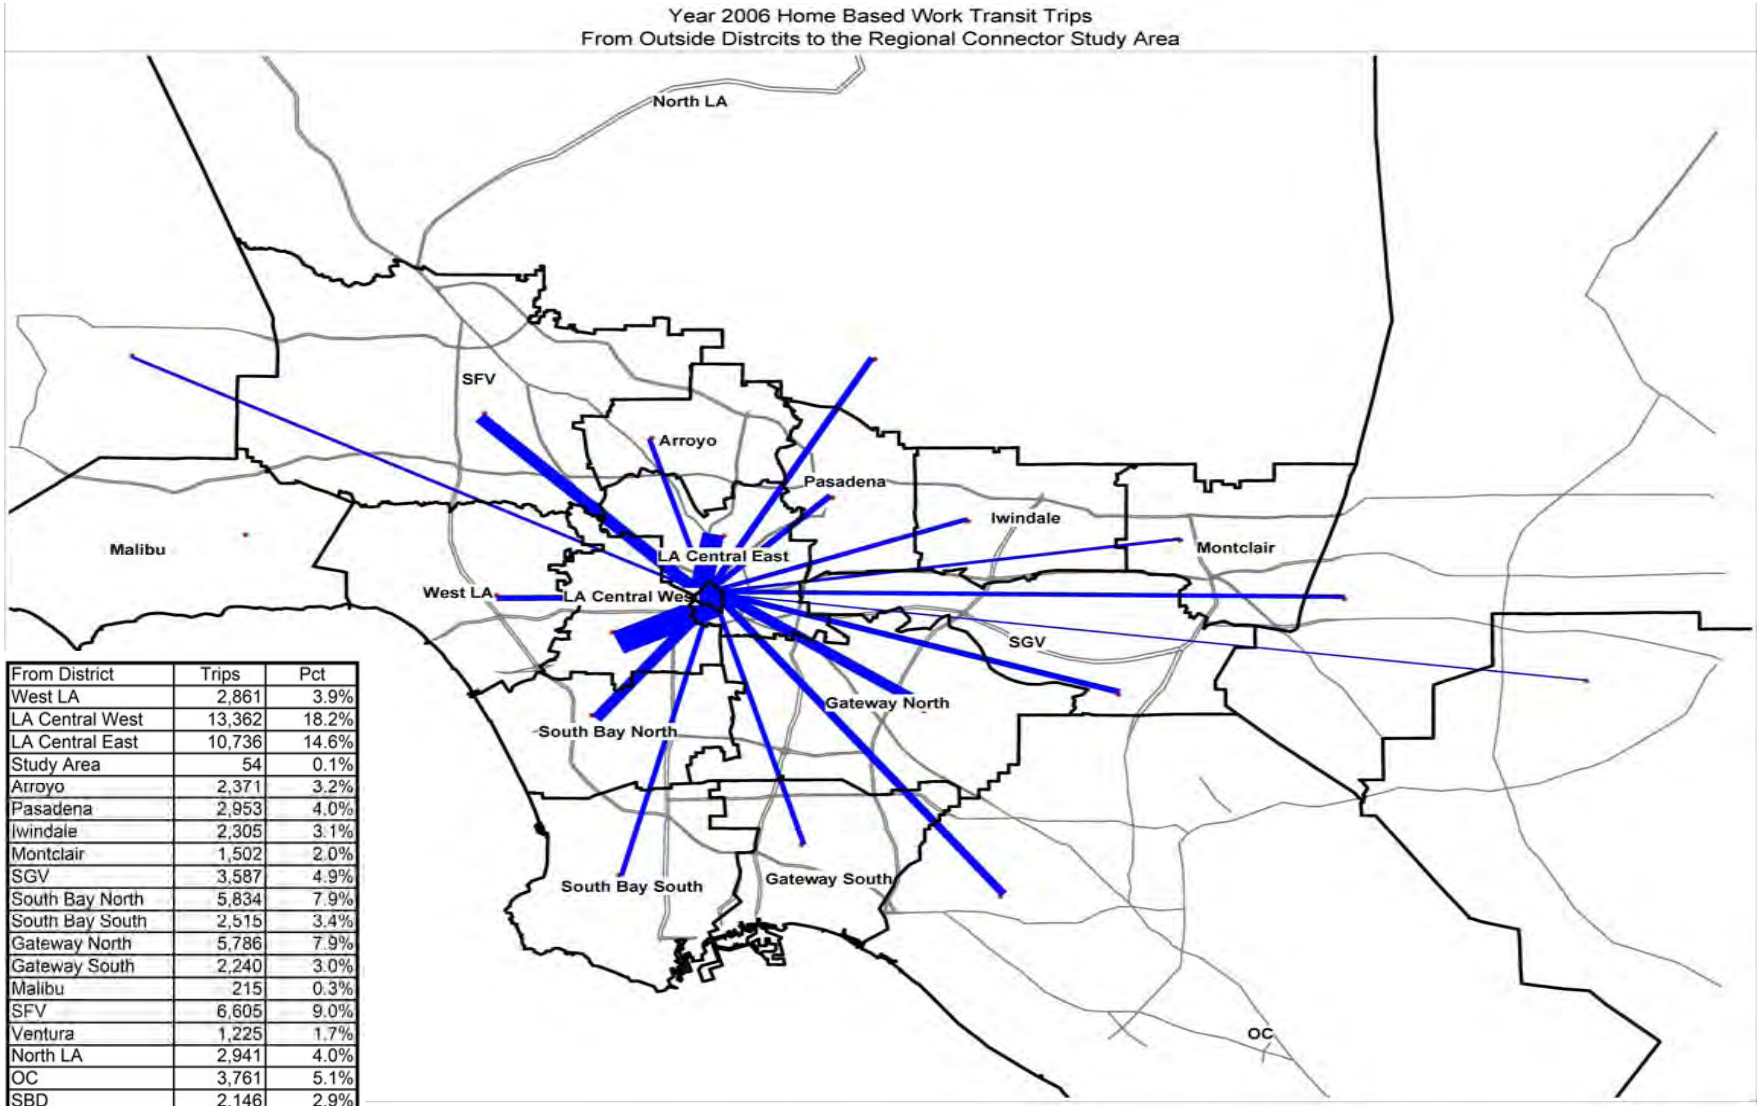
Public transit provides an alternative means of personal mobility, supports increases in demands to alternatives to private transportation, and contributes to improving the quality of life in metropolitan communities.

Transit facilities, services and centers are best when they are customer-friendly, community-oriented and well-designed. A network of transit-based centers and corridors, supported by in-fill development, maximizes the use of existing infrastructure, supports transit ridership, reduces automobile air pollution and preserves natural areas. These improvements will help improve the region's economic vitality, quality of life, and environment.

1.10 Goals and Objectives

The purpose of the Regional Connector is to improve the connections within the existing Metro Rail system and eliminate the need for existing transfers. The project will also expand Metro Rail coverage within downtown. A set of goals was identified at the outset of the project to identify the potential of each alternative to meet these objectives.

These goals and objectives were generated during the early scoping process to reflect input from public agencies, community groups, and individual stakeholders. They address major considerations regarding:



From District	Trips	Pct
West LA	2,861	3.9%
LA Central West	13,362	18.2%
LA Central East	10,736	14.6%
Study Area	54	0.1%

Figure 1-36 Travel Patterns from PSA in 2006

- maximization of transportation benefits,
- integration of the project with local land use enhancements, and
- building a system that is compatible with the dense downtown environment.

The goals are:

Goal 1 - Improve Mobility and Accessibility both Locally and Regionally

Develop an efficient and sustainable level of mobility within the County to accommodate planned growth and a livable environment.

Goal 2 - Provide a Cost Effective Transportation System

Develop a project that provides sufficient regional benefits to justify the investment.

Goal 3 - Provide a Safe and Secure Alternative Transportation System

Develop a project that is safe for riders, pedestrians and drivers while meeting the region's need for security.

Goal 4 - Achieve a Financially Feasible Project

Develop a project that maximizes opportunity for funding and financing that is financially sustainable.

Goal 5 – Support Public Involvement and Community Preservation

Incorporate the public in the planning process and balance the benefits and impacts while preserving communities in the area, such as Little Tokyo, the Arts District, Bunker Hill, Civic Center, and the Historic Core.

Goal 6 - Support Efforts to Improve Environmental Quality

Develop a project that minimizes environmental impacts.

Goal 7 – Support Community Planning Efforts

Support the progression of the regional center as an integrated destination and a dynamic and livable area accommodating projected growth in a sustainable manner.

1.11 Role of This Alternatives Analysis

This AA is intended to provide a more in-depth review of the most promising alternatives identified during prior screening processes. The report describes how eight alternatives were identified from an initial 32 conceptual alternatives for screening. The report then summarizes the evaluation leading to the selection of the two most-promising alternatives for final screening and refinement.

To determine which of the two most-promising alternatives would best achieve the project goals, the AA compares each alternative's transportation benefits and impacts, environmental effects, financial feasibility, and level of community support. The report concludes with a comparative summary of each screened alternative's performance under these criteria and recommends a shorter list of preferred alternatives for further study in a subsequent DEIS/DEIR phase.

Section 2 Alternatives Considered

2.1 Evaluation Method

The process used to develop alternatives, screen them, and select a Locally Preferred Alternative (LPA) is shown in Figure 2-1 and described below.

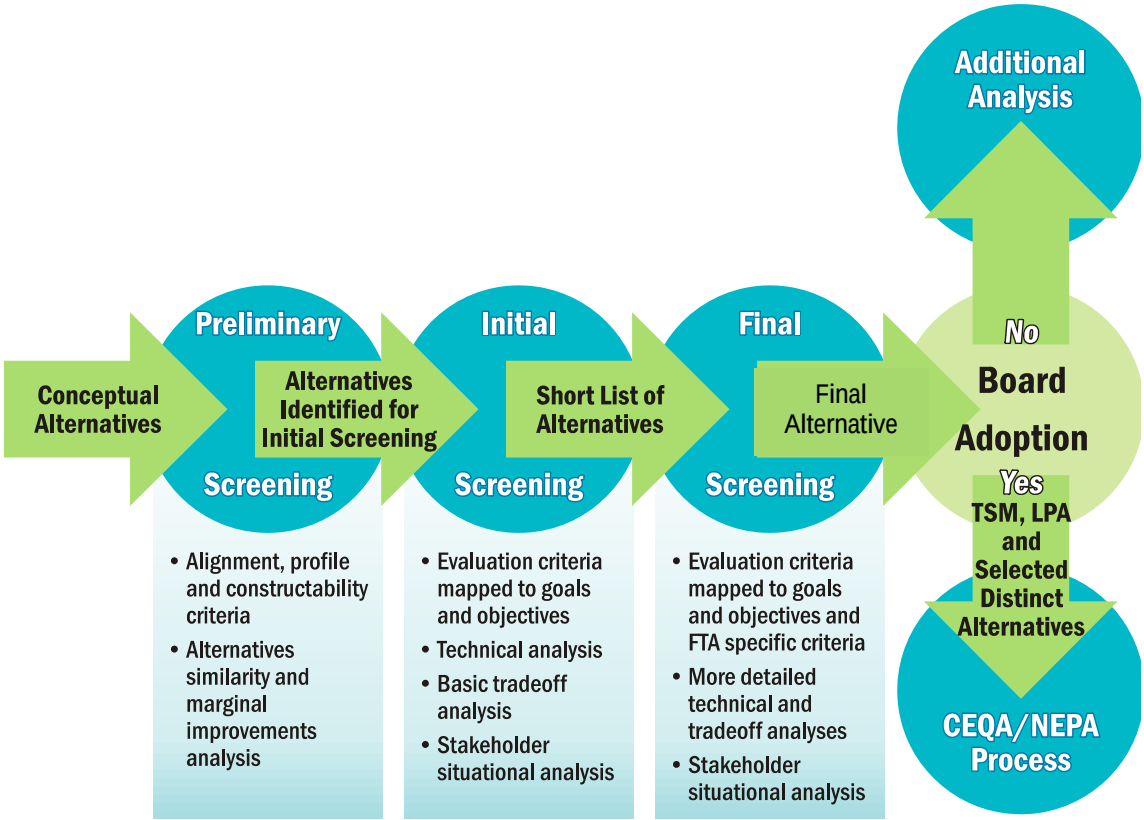

Figure 2-1 Project Process

- Conceptual Alternatives – Alternatives were identified based on previous studies and an evaluation of changed conditions. Alternatives previously studied but no longer viable due to changes in land use, availability of property, and/or efficiency, flexibility, and cost due to construction of new Metro Rail lines were eliminated. There were 36 Conceptual Alternatives identified, the extents of which are shown in Figure 2-2.

Figure 2-2 Regional Connector Potential Corridors

- Preliminary Screening – Based on input received from the Early Scoping process and initial engineering analysis, the initial set of conceptual alternatives was screened based on clear issues related to constructability, right-of-way constraints, impacts of configurations and operational concerns. This preliminary screening resulted in eight Alternatives Identified for Initial Screening. The preliminary screening is documented in the Draft Alternatives Identification Report (January 2008).

- Initial Screening – The eight Alternatives Identified for Initial Screening were evaluated according to the goals, objectives, and evaluation criteria established for the Regional Connector using a multi-criteria comparison method. The Initial Screening resulted in a reduced set of promising alternatives for which details for engineering, environmental and urban design opportunities and issues will be developed. The Initial Screening is documented in the Draft Initial Screening of Alternatives Report (April 2008).

These steps are discussed in more detail below.

2.1.1 Previous Studies

The Regional Connector was originally conceived in 1993 as part of the Metro Blue Line extension to Pasadena. The project was not pursued due to lack of funding availability as well as a plan to use the Metro Red Line as an interim link until the system matured. Since 1993, a few studies were conducted to determine new alternatives considering the changing land uses and expanding Metro Rail system. An overview of these past studies is presented in Section 1.3, Past Studies.

2.1.2 Metro/FTA Scoping

According to the Federal Transit Administration (FTA) New Starts criteria, a scoping period during the AA must be conducted in order to inform the public, organizations, and local, regional, state, and federal agencies on all issues concerning the project, including benefits, costs, and impacts. Early Scoping for the Regional Connector was initiated with the publication of the Early Scoping Notice in the Federal Register on October 31, 2007 and continued for 30 days.

A Public Notice was developed to inform the public of Early Scoping on the project, associated meetings, and other opportunities to provide input concerning the scope of the AA. A copy of the Public Notice, as well as other detailed Scoping Information, can be found in the Project Early Scoping Report, March 2008.

2.1.3 Screening Criteria

The Alternatives Identified for Screening were selected based on their feasibility given the street configuration and dense development in downtown. Several light rail alignments were adapted from previous studies and reports, and additional ones were added and synthesized from combinations of others. Particular thought was given to routes providing better coverage of major activity centers within the PSA between 7th St./Metro Center Station and the Metro Gold Line Eastside Extension.

Some of the formerly proposed routes were not considered because they made use of previously vacant parcels where new dense developments have since been constructed. Some of these parcels included the new location of City Police Department (LAPD) Headquarters, the Grand Avenue Project, and Caltrans Headquarters. Alignments which required a significant number of acquisitions and/or relocation were also removed from consideration. Some smaller, narrow street alignments that were previously surrounded by industrial uses now have adjacent dense residential developments nearby; these noise-sensitive land uses would be incompatible with light rail in a narrow right-of-way.

Some previous studies had identified alternatives that included a significant amount of aerial configuration, as seen in Figure 2-3, with the purpose of reducing impacts to vehicular traffic and allowing for easier grade changes. However, comments received during the Early Scoping period showed little public support for aerial configurations due to aesthetics and sensitive land uses. Also, it was determined that traffic improvements would not be fully achieved as lane reductions would still be necessary for aerial beam supports.

Figure 2-3 Aerial Bridge

Other alignments which were screened and removed from consideration included those which considered a new extension from the recently constructed Metro Gold Line LRT bridge over US-101, as seen in Figures 2-4 and 2-5. Those proposed alignments would require a major alteration and, in some instances, complete demolition and reconstruction. These options would not be financially feasible for the project.

Figure 2-4 LRT Bridge over US-101

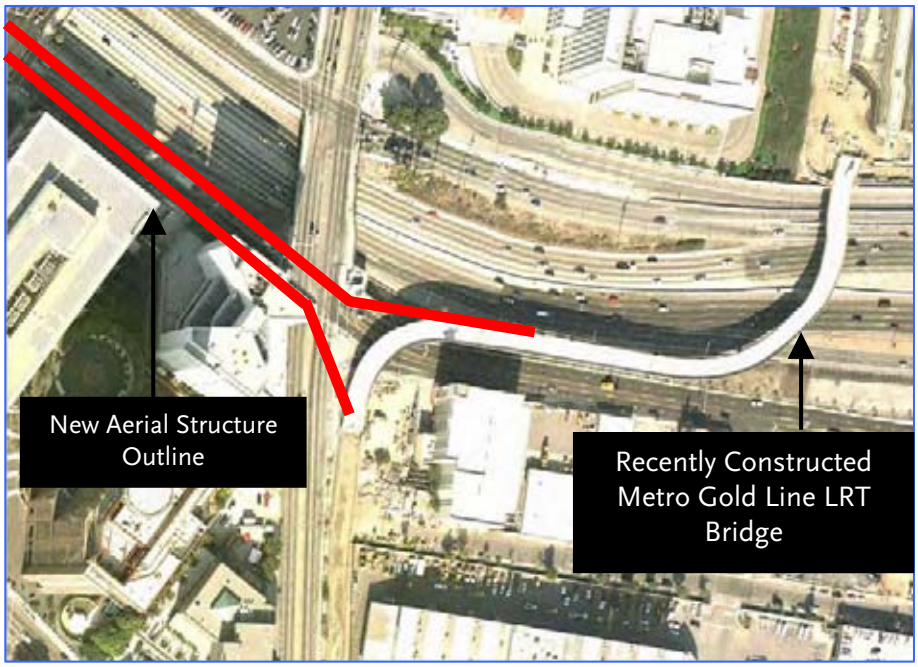

Figure 2-5 LRT Bridge Extension

Finally, a number of previous studies included the possible use of the 3rd St. tunnel for one segment. After further evaluation to the current conditions of the tunnel, it was determined that the tunnel could not be used in either a single or dual-track configuration. The tunnel, as seen in Figure 2-6, is located directly below residential housing. Modifications could result in increased noise and vibration for residents, and constructability difficulties due to the narrow width.

Figure 2-6 3rd St. Tunnel

2.1.4 Screening Criteria Development

Beginning with the goals discussed in Section 1, specific objectives were developed for the Regional Connector. Initial and Final Screening Criteria for each objective were developed during Early Scoping with input from the community and public agencies. The Initial and Final Screening Criteria were developed in the form of specific and detailed performance measures. Table 2-1 summarizes the Regional Connector goals, objectives, Initial Screening Criteria, and Final Screening Criteria.

2.2 Alternatives Identified for Initial Screening

Following completion of Preliminary Screening, eight Alternatives for Initial Screening were identified. A corridor description is provided for each alternative, including alignment configurations and station locations, in Table 2-2. Maps and engineering plans for each alternative are shown in Figure 2-7 to 2-17. A summary of known issues and opportunities is presented in Table 2-3.

2.3 Result of Initial Screening

Each of the alternatives was evaluated in detail with regard to the Initial Screening Criteria. Table 2-4 through Table 2-10 summarizes the results of Initial Screening for Goals 1 though 7, respectively, of the project.

2.4 Short List of Alternatives

Following Initial Screening, two of the most promising alternatives were selected for the Short List of Alternatives: the At-Grade Emphasis LRT Alternative and the Underground Emphasis LRT Alternative. Final Screening will include these alternatives, along with a No Build Alternative and Transportation System Management (TSM) Alternative, which are described below.

2.4.1 No Build Alternative

The No Build Alternative includes all existing transportation facilities as well as all committed transportation projects outlined in the Metro Long-Range Transportation Plan (2001) and SCAG Regional Transportation Plan (2004). This includes the Metro Gold Line Eastside Extension scheduled to open by the end of 2009, the first and second phases of the Metro Expo Line scheduled to open in 2010, and the second phase of the Metro Rapid Bus expansion plan scheduled to be completed in 2008.

These transportation options were discussed in detail in Section 1.5 Transportation Facilities and Services and Section 1.6 Performance of the Travel System. Figure 2-18 shows the existing public transportation system in the PSA that serves as the No Build Alternative. Appendix B contains a list of transit lines serving the PSA and Appendix C shows the lines that closely parallel the general route of the Regional Connector.

Table 2-1 Regional Connector Goals, Objectives, and Performance Measures

Goal	Objectives	Initial Screening Criteria (Performance Measures)	Final Screening Criteria (Performance Measures)
1 Support Community Planning Efforts *Support the progression of the regional center area as an integrated destination and a dynamic and livable area accommodating projected growth in a sustainable manner*	▸ Support land use policies and Community Plans ▸ Support and coordinate with development and redevelopment efforts ▸ Support the City's effort to improve urban design and the pedestrian environment by contributing to a healthy environment ▸ Support efforts to improve safety and security for downtown residents, employees and visitors ▸ Support transit dependent communities	▸ Population, *Population Density, Households, Household Density for year 2030 ¼ mile of alignment* ▸ Transit *Oriented Design supportive plans and policies in place (Score 1 -worst to 5 -best)* ▸ Number *of jobs, employment density for year 2030 within a ¼ mile of alignment* ▸ Number *of direct connections to key activity centers within ¼ mile of alignment (Score 1 -worst to 5 -best)* ▸ Number *of opportunities for redevelopment within ¼ mile of alignment (underdeveloped or underutilized properties along alternative alignment)*	▸ *Number of planned development projects in the area over the next 10 years, including residential/office space/commercial units within a 1/4 mile of stations* ▸ *Number of connections with sidewalks that support the City's Downtown Street Standards*
2 Support Public Involvement and Community Preservation *Incorporate the public in the planning process and balance the benefits and impacts while preserving communities in the area, such as Little Tokyo/Arts District, Bunker Hill, Civic*	▸ Balance the benefits and impacts to low income and minority communities ▸ Enable workers and visitors to gain access to the regional center to increase its economic vitality and benefit from its economic opportunity	▸ *Evaluation of potential disproportionate effects: Environmental justice effects will be evaluated per CEQA/NEPA requirements (Score 1 to 5)* ▸ *Initial areas identified for potential acquisitions for stations and alignment (does not include actually in construction) within ¼ mile of alignment* ▸ *Evaluation of potential disproportionate effects: Number of low* income *HH within¼ mile of proposed alignment* ▸ *Number of residents by ethnicity within ¼ mile of alignment (US Census)* ▸ *Urban fit potential for alignment and for stations, including physical scale, visual fit, and cultural preservation (Score 1 to 5)* ▸ *Percentage of service grade separated* ▸ *Community Acceptance (High, Medium, Low)*	▸ *Number of potential acquisitions* ▸ *Percentage of service grade separated* ▸ *Evaluation of potential disproportionate effects and risk to environmental justice populations related to construction activities (Score 1 to 5)* ▸ *Urban fit potential, including pedestrian accessibility and urban design enhancement opportunities (Score 1 to 5)*

Table 2-1 Regional Connector Goals, Objectives, and Performance Measures

Goal	Objectives	Initial Screening Criteria (Performance Measures)	Final Screening Criteria (Performance Measures)
Improve Mobility and Accessibility both Locally and Regionally 3 *Develop an efficient and sustainable level of mobility within LA County to accommodate planned growth and a livable environment*	▸ Improve the connectivity of the regional transit service and provide a more attractive travel alternative for residents, workers and visitors in the region ▸ Facilitate sustainable regional development ▸ Increase ridership of the Metro transit system and reduce single occupancy trips ▸ Maintain or enhance transit services to the transit dependent ▸ Improve travel time for transit users system-wide ▸ Improve person throughput ▸ Reduce growth of congestion in corridor	▸ *Increase in daily transit boardings (amount of transit users increased compared to No Build)* ▸ *New daily transit trips compared to No Build and Transportation System Management (TSM) alternatives* ▸ *Traffic impacts (Number of intersections with E or F Level of Service)* ▸ *Reduction in number of transfers system-wide by operational plan of alignment (daily reductions at US & 7th St./Metro)* ▸ *Total number of lanes reduced (cumulative for all streets)* ▸ *Number of potentially impacted intersections* ▸ *Peak period travel time through Regional Connector Alignment (including 5 min for each transfer)* ▸ *Number of left turn pockets affected* ▸ *Number of parking spaces potentially affected* ▸ *Number of driveways affected* ▸ *Daily hours of transportation user benefits (Compared to No Build)*	▸ *Hours of transportation user benefits* ▸ *Congestion relief (Reduction in highway travel demand in the corridor)* ▸ *Comparison of highway, bus, and fixed guideway peak period travel times between major travel pairs (Run times, head ways, average speed, station spacing)* ▸ *Peak period travel time (door to door)* ▸ *Travel time savings (Union Station to 7th/Flower)* ▸ *Reduction in Vehicle Miles Traveled (VMT) (VMT compared to No Build)* ▸ *Assessment of expandability (Score 1 to 5)*

Table 2-1 Regional Connector Goals, Objectives, and Performance Measures

Goal	Objectives	Initial Screening Criteria (Performance Measures)	Final Screening Criteria (Performance Measures)
4 Support Efforts to Improve Environmental Quality *Minimize adverse environmental impacts*	▸ Minimize adverse environmental impacts ▸ Implement mitigation measures to reduce environmental effects to acceptable levels ▸ Reduce emissions and improve air quality	▸ *Noise (Number of curves for LRT alignment)* ▸ *Potential visual impacts to notable architectural resources within ¼ mile of alignment (Score 1 to 5)* ▸ *Number of Potential Sensitive Receptors within ¼ mile of alignment (Score 1 to 5)* ▸ *Potential impacts to historically significant locations within ¼ mile alignment (Score 1 to 5)* ▸ *Geologic and geotechnical issues along alignment (Score 1 to 5)*	▸ *Expected level of impacts after mitigation to biological, social, and physical resources will be evaluated per CEQA/NEPA requirements (Score 1 to 5)* ▸ *Reductions in PM10, NOx, and SOx emissions* ▸ *Reduction in carbon footprint for average user*
5 Provide a Cost Effective Alternative Transportation System *Develop a system that serves as an alternative to travel economically*	▸ Increase ridership on the Metro system ▸ Minimize cost per passenger ▸ Maximize travel time savings	▸ *Rough order of magnitude annual O&M (2008$) costs per alignment (millions)* ▸ *User cost - Cost effectiveness compared to No Build ($/hour of transit user benefit)*	▸ *Annualized cost per hour of transit system user benefit compared to No Build and Transportation System Management (TSM) alternatives* ▸ *Annual O&M costs*
6 Achieve a Financially Feasible Project *Develop a project that maximizes opportunities for funding and financing and that is financially sustainable*	▸ Opportunities for private/public funding ▸ Opportunities for Federal and outside funding	▸ *ROM Capital costs — total and per mile per alignment (2008$) (millions)* ▸ *Evaluation of availability and eligibility of capital funds at federal/state/local levels to construct, operate and maintain (Score 1 to 5)*	▸ *Capital cost estimate disaggregated by right of way (ROW), guideway, stations, yards, and vehicles on a cost per mile basis*

Table 2-1 Regional Connector Goals, Objectives, and Performance Measures

Goal	Objectives	Initial Screening Criteria (Performance Measures)	Final Screening Criteria (Performance Measures)
7 Provide a Safe and Secure Alternative Transportation System *Develop a project that is safe for riders, pedestrians, and drivers while meeting the regions needs for security*	▸ Secure entire alignment, stations, track and other facilities ▸ Develop direct and indirect safety measures that exceed safety precautions typical of the Metro system ▸ Develop a system that balances the need for accessibility and mobility with security ▸ Develop a system that uses accessibility and mobility as measures for safety and security	▸ *Safety – determined to be able to provide measures typical of requirements per ADA, per typical CPUC requirements, fire life safety guidelines, and per Metro Design Guidelines for access to and from stations (amount grade separated) (Score 1 to 5)* ▸ *Number of emergency facilities located within ¼ mile of the alignment, i.e., fire stations, police stations, hospitals.* ▸ *Number of public events within ¼ mile of alignment*	▸ *Number of crossing with high pedestrian activities on a daily basis* ▸ *Number of events along the alignment* ▸ *Number of potential issues related to accessibility and line of sight for pedestrians and vehicle drivers (Score 1 to 5)*

Table 2-3 Constraints and Opportunities

General Station Location	Alignment	Constraints/Issues	Opportunities
2nd St. between Main St. and Spring St.	1a, 1b, 4a, 4b	*Narrow ROW on 2nd St *LAPD Headquarters currently under construction may cause traffic/emergency issues *Pedestrian safety outside high volume location *Station set back from street onto LAPD property	*Newly revitalized 2nd St. restaurants/bars/art spaces would be easily accessible *Station would be located in central location to LA Times, LAPD, Caltrans and only 1 block from City Hall and Civic Center *Modern/architectually significant design can be incorporated into LAPD Headquarters *Station will serve adjacent Little Tokyo community and Block 8 residential housing
Flower St. between 5th St and 6th St.	1a, 2, 7	*Station must be located considerably below Arco Plaza underground shopping center- geotechnical/soil issues *Arco Plaza underground shopping center - physical as well as noise, vibration	*Opportunity to incorporate station into Arco Plaza shopping center *Opportunity to incorporate station into Central Library *Central location to financial/business core
Flower St. between 3rd St and 4th St.	1b, 3b, 4a	*Station is located in partially isolated area *Station is located underneath pedestrian bridge - contruction issues *Station may cause security issues at World Trade Center	*Station is located adjacent to World Trade Center *Station is located within walking distance of business as well as residential properties
Temple St. between Los Angeles St. and Judge John Aiso St.	2	*Station is located adjacent to federal buildings as well as new metropolitan detention center which may cause security issues *Transient activity at station would need constant vigilance	*Station is adjacent to Civic Center *Station is located next to arts' centers such as MOCA's Geffen, The Japanese American Museum, and the future Children's Art Park *Station design may tie into the adjacent arts institutions *Opportunities to revitalize the LA Mall
Dewapp St. between Figueroa St. and Hope St.	2	*Structural issues on elevated Dewapp St *DWP property availability *Pedestrian safety at station and Hope St. due to 101 fwy on/off ramps	*Station serves city offices such as DWP, Health Services Administration, and the Los Angeles building *Station is located adjacent to Grand Ave Project and arts' centers such as Dorothy Chandler and Disney Hall *Station is one block from Our Lady of the Angels Cathedral
Flower St. between 4th St. and 5th St.	9a, 4b, 5, 8	*Station located under Bonaventure Hotel - noise/vibration issues	*Station is located in central location to financial core and LA Library *Central location and popular stop among tourists and visitors to downtown Los Angeles
Grand Avenue Development	3a, 3b, 4a, 4b, 5, 6, 7, 8	*Adverse effects to 2nd St. tunnel structure *Incorporation of station into residential housing above *Incorporation of station adjacent to Grand Ave Project underground parking/storage/facilities *Location of entrance/exit portal on street level	*Incorporation of station design and artwork with the Grand Ave Development *Ideal location for tourists and visitors to arts/theater districts - encourage activity *Exit from station would be located at the top of Bunker Hill, making for easier pedestrian movement *Station portals can serve both upper Grand Ave as well as businesses on 3rd and Flower
Main St. and Los Angeles St. between Temple St. and 1st St. (Couplet)	3a, 3b	*Station is located on City Hall Parcel - possible security issues *Station would cause for removal of public open space	*Station serves Civic Center and public services buildings *Station is located one block from Little Tokyo district *Station can serve as 'link' for the eastern portion of future Civic Park
Los Angeles St. between Temple St. and 1st St.	7	*Station would require removal of center median/trees on Los Angeles St. *Station is adjacent to metropolitan detention center - possible security issues	*Station serves Civic Center and public services buildings *Station is located one block from Little Tokyo district
2nd St. between Main St. and Spring St.	5,8	*Station may conflict with LAPD underground facilities *Station may conflict with LA Times underground facilities	*Station does not impact surface level traffic and/or narrow 2nd St. ROW *Station serves surrounding Civic and arts establishments *Station is within reasonable walking distance of Little Tokyo district and Historic Core
2nd St. between Los Angeles St. and San Pedro St.	6	*Station and portals may cause noise issues for Block 8 residential development above	*Station is adjacent to Little Tokyo district and may incorporate art/cultual architecture *Station is in relatively close distance to all Little Tokyo residential housing *Opportunity to incorporate station into Block 8 development *Station is located adjacent to Historic Core and new Arts districts along 3rd St.
6th St. and Flower St. (Under Intersection)	6	*Station must be located considerably below Arco Plaza underground shopping center- geotechnical/soil issues *Arco Plaza underground shopping center - physical as well as noise, vibration	*Opportunity to incorporate station into Arco Plaza shopping center *Opportunity to incorporate station into Central Library *Central location to financial/business core

Table 2-4 Goal 1: Support Community Planning Efforts

Goal 1: Support Community Planning Efforts	*Support land use policies and Community Plans *Support and coordinate with development and redevelopment efforts *Support the City's efforts to improve urban design and the pedestrian environment by contributing to a healthy environment *Support efforts to improve safety and security for downtown residents, employees and visitors *Support transit dependent communities

Table 2-6 Goal 3: Improve Mobility and Availability both Locally and Regionally

Goal 3:
Improve Mobility and Accessibility both Locally and Regionally

*Improve the connectivity of the regional transit service and provide a more attractive travel alternative for residents, workers and visitors in the region
*Facilitate sustainable regional development
*Increase ridership of the Metro transit system and reduce single occupany trips
*Maintain or enhance transit services to the transit dependent
*Improve travel time for transit users system-wide
*Improve person throughput
*Reduce growth of congestion in corridor

Note for 3c,3e,3f,3h,3i:
Assumptions:
-Center running LRT with center stations.
-Train envelope (influence area) for one center running track and no station is 13 feet = one lane width.
-Train envelope (influence area) for one center running track with center station is 26 feet = two lane widths.
-Train envelope (influence area) for two center running tracks and no station is 26 feet = two lane widths.
-Train envelope (influence area) for two center running tracks with center station is 39 feet = three lane widths.
-For all alternative alignments it is assumed that at least one traffic lane will be available and operational in each direction.
-Right of way will be provided if difference between the street curb to curb width and the train envelope is less than the width needed to accomodate a traffic lane in each direction of travel.

Figure 2-18 No Build Alternative

2.4.2 Transportation System Management

The TSM Alternative (Figure 2-19) imitates the proposed light rail link between 7th St./Metro Center Station and Union Station using two shuttle bus routes. Buses would run frequently, perhaps just a few minutes apart during peak hours, and the routes would be designed to move passengers between the two stations as quickly as possible. Intermediate stops would provide additional transit coverage of Bunker Hill, Little Tokyo, and the Civic Center. A variety of bus sizes could be used to tailor capacity to demand, ranging from 30-ft. DASH style buses to 60-ft. articulated buses.

In addition to frequent headways, the TSM Alternative could employ a Transit Priority System (TPS) similar to the ones currently used on Metro Rapid Lines within the City. Due to the constant pick up and discharge of passengers, buses usually fall out of synchronization with signal progression, lengthening the time spent at red lights. Installation of a TPS system or re-coordination of the signals along the TSM would counter this effect.

In a TPS, transponders mounted to the undersides of the buses would trigger detector loops embedded in the pavement in advance of each signalized intersection along the route. Upon detecting the bus, the City's central Automated Traffic Surveillance and Control (ATSAC) system would trigger the signal controller to grant additional time on the green light to the oncoming bus (usually 10-15% of the total cycle time), up to once per cycle. The existing Metro Rapid Lines have shown that the TPS keeps buses moving quickly, reduces trip times, and increases passenger throughput. Use of existing or creation of new bus-only lanes where right-of-way is available could also improve travel speeds.

There are two proposed alignments for the TSM Alternative, described below.

Grand/Temple/Los Angeles Alignment: This alignment is similar to the existing LADOT DASH Line B service. Buses travel from Chinatown to 7th St./Metro Center Station using Los Angeles St., Temple St., and Grand Ave. The route could be easily modified to serve the Little Tokyo/Arts District Station by using Alameda St. instead of Los Angeles St. between Temple St. and Union Station. Service currently operates every 8 minutes, but the frequency could be increased to make the line more convenient to Regional Connector passengers. This alignment provides good coverage of the Bunker Hill and Civic Center areas, but bypasses most of Little Tokyo.

Figueroa/Flower/2nd/3rd/Alameda Alignment: This alignment would take advantage of the existing northbound bus-only lane on Figueroa St. and the light usage of 2nd and 3rd Streets by other bus services. TPS would be easier to implement here because buses would only travel in one direction along most streets, eliminating signal priority conflicts between two competing buses. The alignment passes by both the Little Tokyo/Arts District Station and Union Station, so easy connections would be available to both East Los Angeles- and Pasadena-bound passengers. This route provides good coverage of Little Tokyo and the southern edge of the Civic Center, but passengers would be required to undertake a two-block uphill climb to reach Bunker Hill.

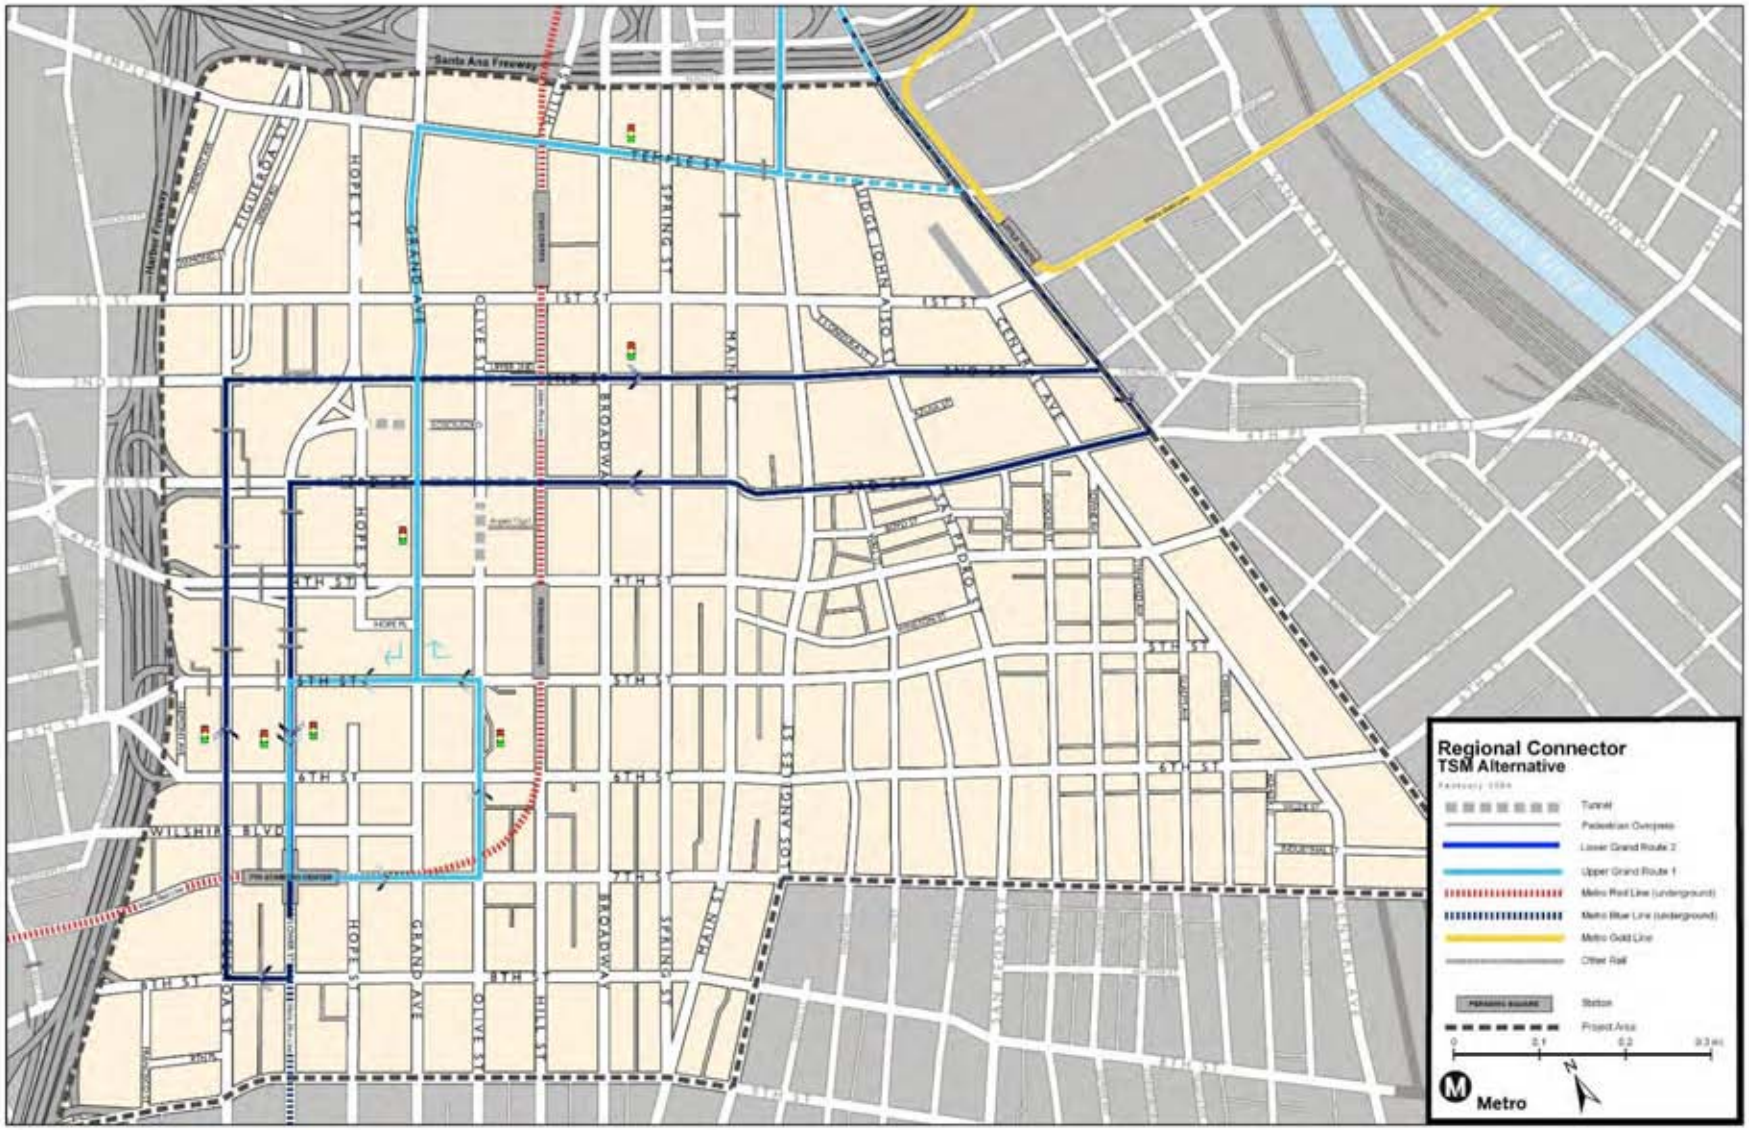

Figure 2-19 TSM Alternative

Bus speeds along the two TSM Alternative alignments were approximated using eight time runs (two per route, per direction) conducted during the afternoon peak period on Monday, May 5, 2008. Table 2-11 through Table 2-16 show the distance between arbitrarily-selected time points along each route, the time it took to traverse each segment, and the corresponding speed. The time runs were performed without pulling over to simulate picking up and discharging passengers, so an estimated dwell time of thirty seconds was used to account for the time penalty of stopping. Both of the TSM bus routes have two terminal stops and six intermediate stops, so the total dwell time estimate added to each run was three minutes.

Overall, the calculations predicted average bus speeds of 9-12mph, a range similar to the observed speeds of Metro's local bus service. Thus, a typical trip on the Upper Grand TSM route during the weekday afternoon peak period would take approximately 11-13 minutes and a trip on the 2nd St. route would take 11-15 minutes.

The time runs were conducted using a small car, which was capable of much better handling, braking, and acceleration performance than a typical bus. Data limitations arose as a result of not having an actual transit bus available to conduct the time runs. The car attained much shorter trip times than the TSM bus service likely would for a number of reasons. While the driver avoided maneuvers that would be difficult for a bus to perform, it also would have been unsafe and disruptive to traffic flow for a passenger car to drive slowly enough to imitate the speed of a bus. Similarly, pulling over and stopping at each of the proposed TSM bus stops would have interrupted existing bus service and violated the "no stopping anytime" restriction signs posted at the bus zones.

Another potential source of delay in bus service is the tendency for buses to fall out of the aforementioned synchronization with street signal progression; buses would then have additional wait time at red lights. The 30-second dwell time was used to account not only for the time that the bus would actually be stopped, but also the slower speed and additional red light wait time that would be incurred.

Another data limitation arose at one intersection along the Upper Grand TSM route where only buses are allowed to turn left (7th St. and Olive St.). In order to proceed along the route without violating the left turn restriction, the driver had to estimate the wait time needed to make the left turn, then detour around the block to continue north on Olive St. It is unlikely, however, that this deviation from the TSM route significantly affected the recorded trip time.

2.4.3 At-Grade Emphasis LRT Alternative (Options A and B)

The At-Grade Emphasis LRT Alternative, as shown in Figure 2-20, will provide a direct connection from the Metro Gold Line at Temple St. to the existing underground 7th St./Metro Center Station with at least three new station locations in between. The At-Grade Emphasis LRT Options A and B are identical, with the exception of the station locations on Flower St. It is assumed that street-running trains will operate by existing traffic signals and will not require crossing gates and bells.

Description

In this alternative, dual-track service from the Metro Gold Line at Temple Street is extended using a "Y" track configuration across Alameda St., utilizing existing traffic and parking lanes to travel. The tracks would extend to the west across Alameda St. and run along the south side of Temple St. An existing Mechanically Stabilized Earth (MSE) ramp connects tracks from the bridge over US-101 to the tracks on surface just north of Temple St. In order to accommodate the turning radius for the trains, the ramp will need to be adjusted to provide a steeper grade.

As trains continue west on Temple St. in a dual-track configuration, the track will return to the center of Temple St. As the track arrives at Los Angeles St., the alignment splits into two single-track alignments. One track would continue west to Main St. while the other track would continue south on Los Angeles St. The track alignments would run on the eastern side of both streets and a split station would be planned for each track alignment just north of 1st St. The track alignments then would continue south across 1st St. At 2nd St., the track on Los Angeles St. heads west where it then reconnects with the track on Main St. Both track alignments would return to a dual-track configuration.

At 2nd St., adjacent to Broadway Ave. and Spring St., another split station is possible if property was acquired and easements provided on adjacent properties. This station is currently optional and will be further analyzed for ridership and cost implications in the next phase of the project. With or without a station, the street would be transit-dedicated with the two travel lanes and two parking lanes reduced to a single travel lane primarily for access to parking lots or loading zones. This type of configuration would extend from Los Angeles St. to Hill St.

As the track alignment continues west past Hill St., it would be on the southern side of the street and enter into the existing 2nd St. tunnel. This alignment would then reduce the 2nd St. tunnel from four travel lanes to one or two travel lanes, pending further detailed engineering. About halfway through the 2nd St. tunnel, the alignments then would veer to the south, through the existing tunnel wall. This would place the alignment in close proximity to Grand Ave., near the second station.

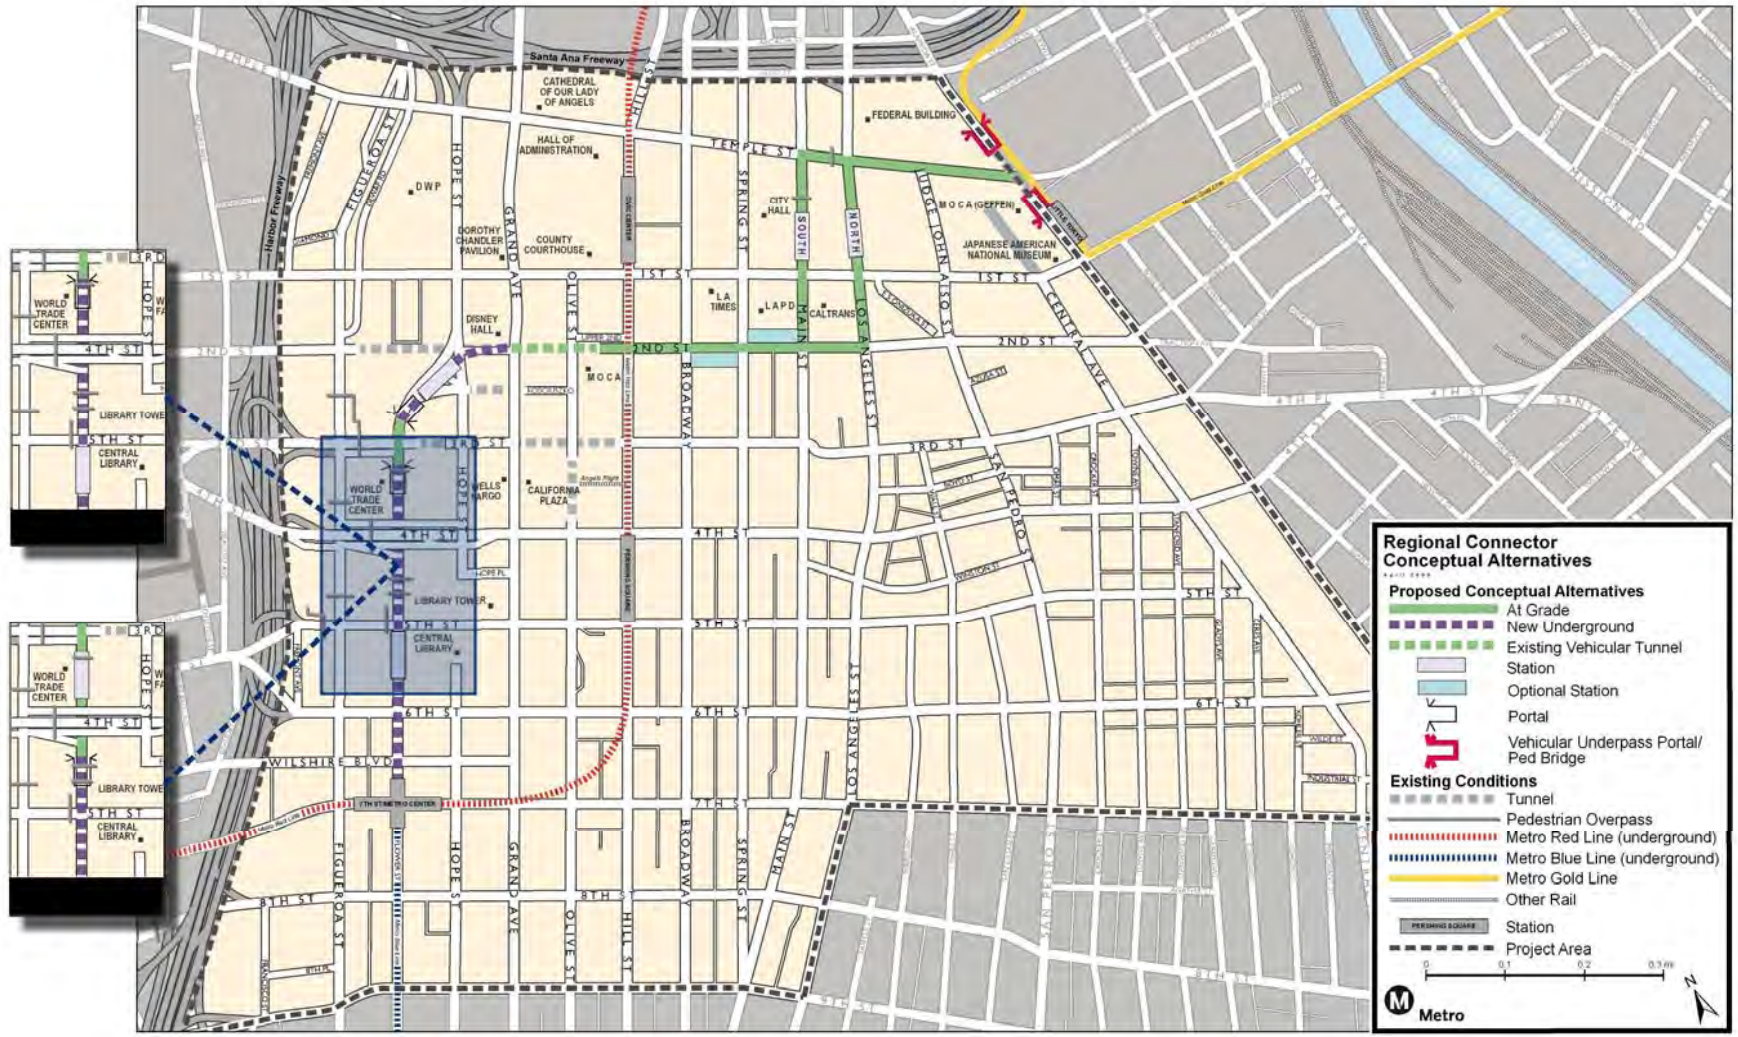

Figure 2-20 At-Grade Emphasis LRT Options A & B

Using the natural grade change of the hillside, the alignment would then resurface from a portal, off-street, just north of 3rd St. It would cross 3rd St. at-grade and continue south on Flower St. A third station is contemplated on or under Flower St., either at-grade south of 3rd St. or underground south of 5th St. In either case, south of 3rd St. and north of 5th St., the track alignment then enters into a portal in order to be fully underground before reaching 5th St. The underground track alignment then directly connects to the 7th St./Metro Center Station under Flower St.

Construction

Construction of this alternative assumes using the center of the street for staging and construction of the at-grade areas. Utilization of the 2nd Street tunnel for construction will also be necessary. Cut and cover construction techniques will be used for the underground segment from 7th St. and Flower St. to 3rd St. and Flower St. as well as at the Grand Avenue Station. Locations adjacent to the alignment may be used for some storage, vehicle equipment, offices and materials. Those locations will be identified when further engineering is conducted during the later phases of this project and as part of the EIR/EIS process.

Conclusion

The At-Grade Emphasis LRT Alternative accomplishes many of the goals and objectives of this project. Both options connect major activity centers within the PSA while introducing an element of pedestrian integration through the at-grade configuration. The couplet arrangement along Main St. and Los Angeles St. provides for creative ways to integrate the system through urban design with the surrounding Civic Center and municipal activities as well as the growing Little Tokyo community. An at-grade system allows pedestrians to view and understand the direction of a train. The alternative also provides a unique opportunity to incorporate an integrated pedestrian transit mall along 2nd St.

Figures 2-21 through 2-47 provide examples of alignments, station locations, and urban design elements. For display purposes, characteristics of the at-grade station on Flower St. in Option B are shown. All other renderings pertain to both Options A and B.

2.4.4 Underground Emphasis LRT Alternative

The Underground Emphasis LRT Alternative, as shown in Figure 2-48, uses the same type of "Y" dual-track configuration as the At-Grade Emphasis LRT Alternative.

Description

From the Little Tokyo/Arts District Station, the tracks lead at-grade southwest across 1st and Alameda Streets. Here, the property within the area bounded by Central Ave., 1st St., Alameda St., and 2nd St. would be acquired to construct a portal and create twin tunnels.

The twin tunnels would extend west under 2nd St. to a new station in the vicinity of 2nd and Los Angeles Streets. The alignment continues west underground with a second new station in the vicinity of Grand Ave. near 2nd St. The alignment then veers south to a final underground station in the vicinity of Flower St. and 5th St. The tunnels then continue south to connect to the existing 7th St./Metro Center Station.

Figure 2-46 At-Grade Emphasis LRT Option B – Flower St. and Station Looking South

Figure 2-47 At-Grade Emphasis LRT Option B – Flower St. and Station Looking South from 3rd St.

Construction

Tunnel boring machines (TBM) would be required to create the twin tunnels. Cut and cover construction techniques will likely be utilized for the new underground stations and staging area for the launching of TBMs.

As additional details are developed on this alternative, the specific locations of and need for ancillary facilities will be identified.

Conclusion

The Underground Emphasis LRT Alternative also accomplishes many of the project objectives. Many of the comments received in Early Scoping supported an underground configuration due to the dense development in the PSA and reducing adverse impacts to traffic congestion and personal safety.

Figure 2-48 Underground Emphasis LRT Alternative

In consideration of the built-out environment of downtown, this analysis was conducted to identify available and appropriate station and portal locations which would benefit the most users and best-integrate with the surrounding street-level environment.

Due to the high traffic and pedestrian volume on Alameda St., a rail underpass at the Little Tokyo/Arts District Station would keep vehicular, pedestrian, and rail movements separate, smoothing the flow of each through the area. This location, on the north eastern edge of Little Tokyo, would serve as a gateway into the growing community and could create an opportunity to create a vibrant and engaging center of street-level activity.

Figures 2-49 through 2-63 show examples of alignments, station locations, and urban design elements.

2.4.5 Station Locations

The At-Grade Emphasis LRT Alternative and Underground Emphasis LRT Alternative have a set of station locations which serve various parts of the PSA. Station locations were chosen through the investigation of past studies, the current downtown dynamics and travel characteristics, and track alignments.

2.4.5.1 Underground Station on Flower St.

The underground station on Flower St. would be between 5th and 6th Streets in the heart of the Financial District. The station would serve the extremely high density of workers in the surrounding businesses, including the Bonaventure Hotel, 444 Flower, Arco Plaza, and the Central Library. As seen in Figure 2-64, the station has a center platform. Station portals would be located on the eastern and western side corner of Flower St. at 5th St. These locations allow users to come up to street level and instantly assess their surroundings.

The area is an important activity center in the PSA, surrounded by notable business towers as well as tourist attractions. Previously, the idea of possibly creating a joint use station with adjacent businesses had been analyzed, specifically at the Bonaventure Hotel and the underground Arco Plaza (now City National Plaza). Further analysis must be conducted in order to evaluate the possibilities. Opportunities to create pedestrian linkages and bike centers also exist, which will reenergize these underutilized urban spaces.

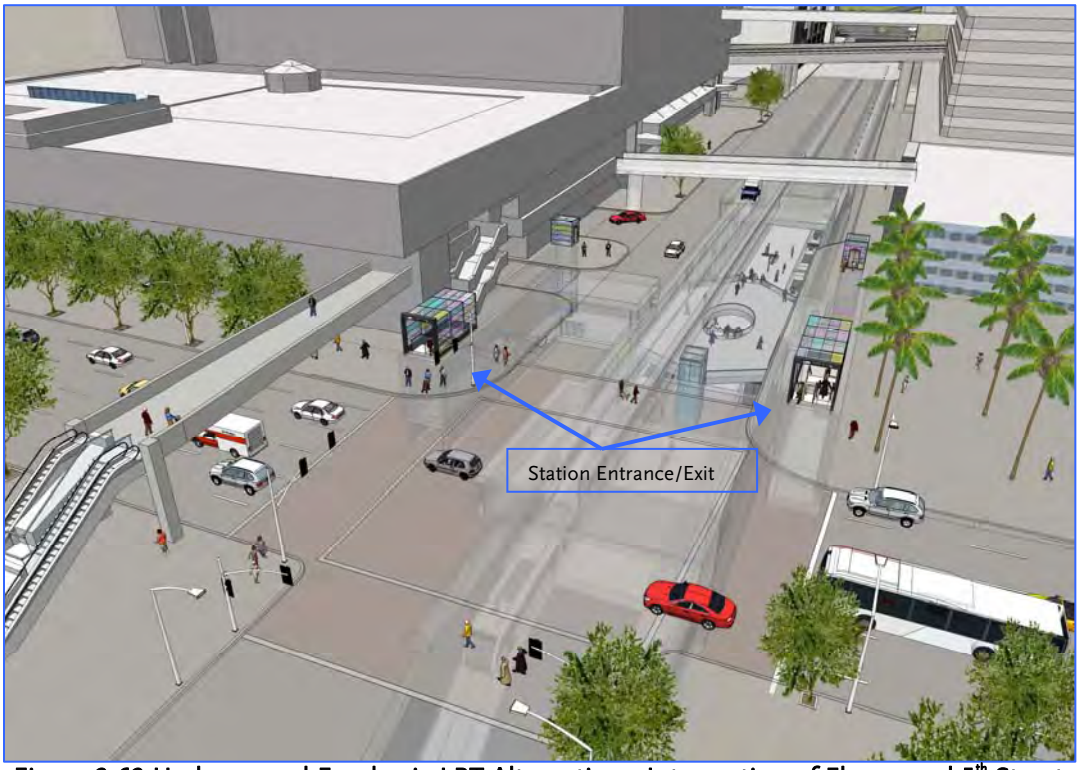

Figure 2-62 Underground Emphasis LRT Alternative – Intersection of Flower and 5th Streets Looking Northwest

Figure 2-63 Underground Emphasis LRT Alternative – Flower St. Looking North from 5th St.

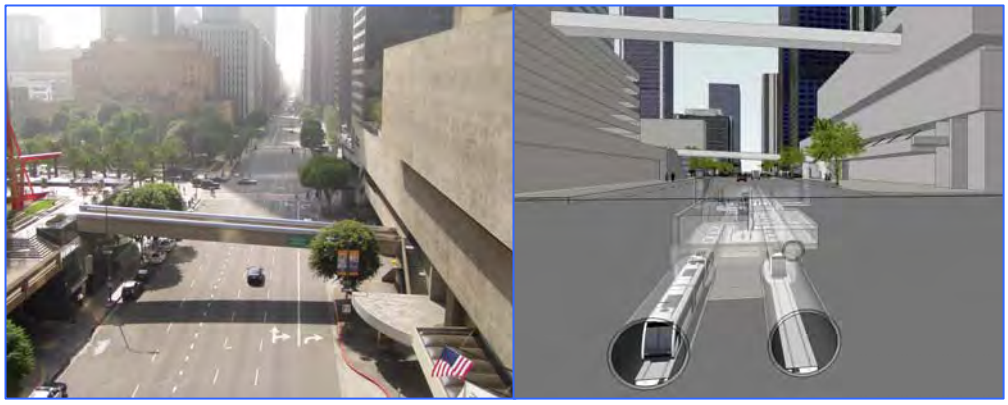

Figure 2-64 Underground Station on Flower St.

2.4.5.2 At-Grade Station on Flower St.

The at-grade station on Flower St. would be located between 3rd and 4th Streets. The station would have a center platform for northbound and southbound trains on either side as well as two lanes of traffic for vehicular movements, as seen in Figure 2-65. The station utilizes stairs on either end, allowing for users and pedestrians to enter/exit onto crosswalks, one located across the 3rd St. intersection and the other located mid-block on Flower St. between 3rd and 4th Streets.

The station would be on the northern end of Flower St. in front of the World Trade Center and BP Plaza. Traditionally an underutilized space, this station provides an opportunity to re-introduce a vibrant urban experience through the use of street treatments, landscaping, and street furniture. Because the station location is close to an important on-ramp to US-110, the use of these elements can soften the overall environment and make it more pedestrian and transit-friendly.

The World Trade Center is a multiuse facility which, apart from being home to a number of import/export companies and law offices, teams with teaching institutions to provide instruction and classroom locations for students. A station in this location would support these activities in addition to improving access to the Financial District.

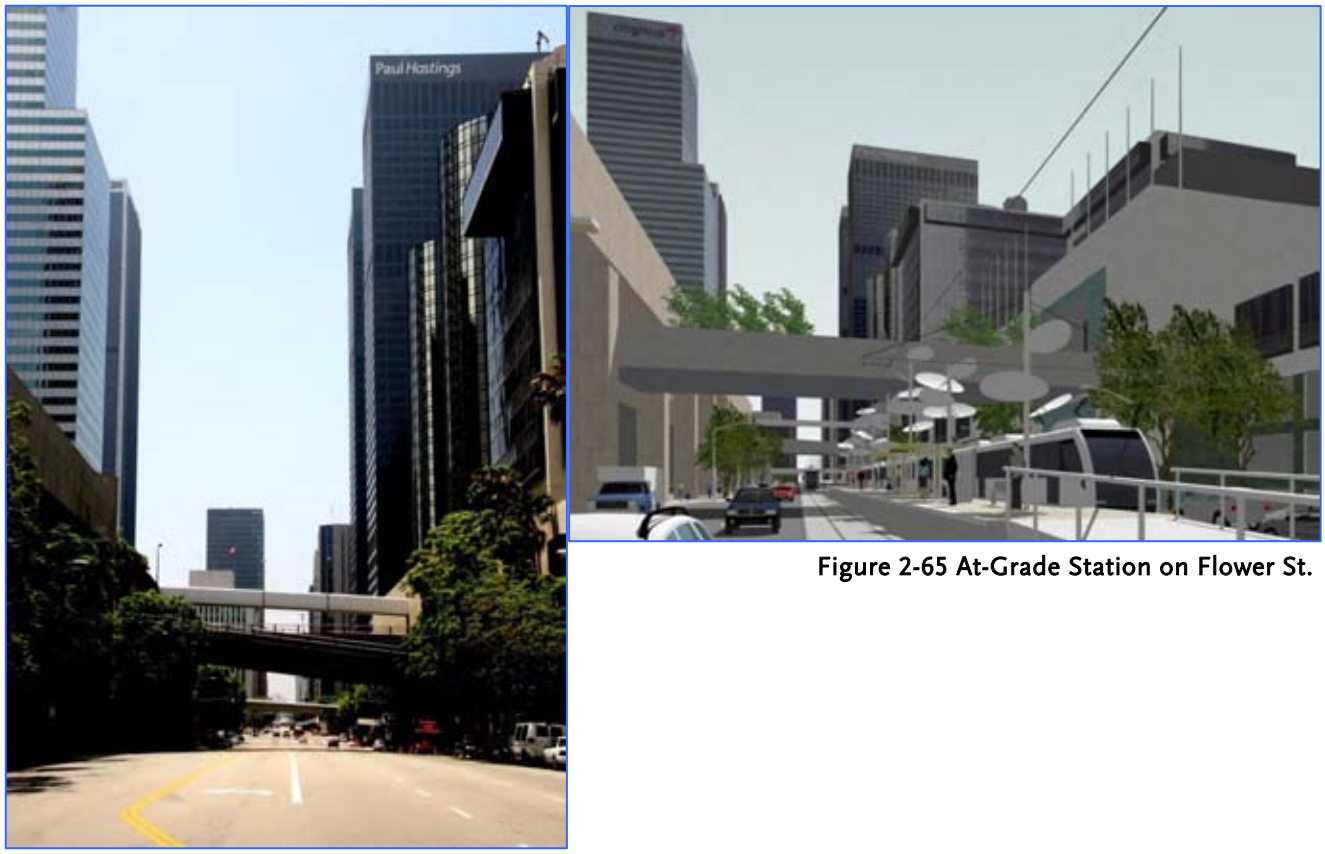

Figure 2-65 At-Grade Station on Flower St.

2.4.5.3 Grand Avenue Station

The Grand Avenue Station would be located under the 2nd St. vehicular bridge. Because the station tunnel would be diagonally-angled, access to both upper and lower Grand Ave. is possible. This station is part of the Grand Avenue Project, a much larger vision by the City to create a vibrant new regional center with mixed commercial, residential, and entertainment uses. The Grand Avenue Project is projected to be a first-class destination point not only for city residents but for tourists alike. The station would be incorporated into other underground facilities and provide direct access to the street. Comments received during Early Scoping indicated high interest in having a station in this location.

2.4.5.4 Split Station (City Hall)

The At-Grade Emphasis LRT Alternative has a split station with platforms on both Main St. and Los Angeles St, as shown in Figure 2-66. The Main St. platform is located on the eastern side of the street and is used by southbound trains. The Los Angeles St. platform is also located on the eastern side of the street and is used by northbound trains. The width of both streets allows for four lanes to remain for vehicular traffic.

The split platform design allows for transit users and pedestrians alike to have a free flowing through passage in the outdoor plaza area, while providing visual directions for train movements. The station is situated on the eastern portion of the Civic Center and is walking distance from federal and municipal buildings as well as new developments which have high levels of activity, such as the LAPD Headquarters currently under construction and the Caltrans building. The Little Tokyo community is also within 2 blocks of the station, which makes this a good location for a variety of users.

Figure 2-66 Split Station (City Hall)

Located next to historically-significant City Hall, the station design incorporates elements which would maintain the feel of the existing environment. Urban design treatments can be used to enhance the station identity and give the user a unique transit experience.

2.4.5.5 Underground Station on 2nd St.

The underground station on 2nd St. is located between Main St. and Los Angeles St. The station is a center platform configuration and sits directly beneath the newly constructed LAPD Headquarters building. Portals are located on either side of 2nd St. at Los Angeles St. as seen in Figure 2-67. Although the street environment in this location is very dense and built-out, the portals fit well in terms of visibility and location. The portal on the southern side is adjacent to the St. Vibiana Arts complex and Little Tokyo Library; on the north it is next to the Caltrans building.

Figure 2-67 Underground Station on 2nd St.

The station supports the eclectic street environment of residents and downtown workers. Currently, there are various residential developments which are planned or under construction in this vicinity. The St. Vibiana Arts complex is a planned residential development which will have over 300 units. Across the street is the Block 8 development which will play a significant role in shaping the Little Tokyo community while at the same time creating the missing 'link' along the 2nd St. corridor. These residential complexes, along with many redeveloped buildings, are breathing life back into this district which is now home to a variety of sidewalk restaurants, bars, and art galleries.

2.4.5.6 Optional Station on 2nd St.

The At-Grade Emphasis LRT Alternative has an optional split station on 2nd St. between Main St. and Broadway St. One station would be located directly in front of the new LAPD Headquarters with an elevated platform which would create a secured, green open space on the parcel. A second station would be located on the south side of 2nd St. between Spring St. and Broadway St. All pedestrian movements at all intersections would remain the same; however, east-west vehicular traffic would not be allowed due to the space needed for train movements. Currently, the parcel adjacent to the station between Spring St. and Broadway St. serves as a surface parking lot. Plans for a residential complex have

been identified. Other surrounding buildings include the Los Angeles Times headquarters and the future home of the Federal Courthouse. The station area is shown in Figure 2-68.

This split station serves many purposes. Still centrally located to the Civic Center and within walking distance of Little Tokyo, the station is closer to the western end of 2nd St. and Broadway St. During Early Scoping, some comments indicated interest to incorporate a station on Broadway St., a main corridor in the PSA. Currently, the City has a plan called 'Bring Back Broadway' to rehabilitate businesses and create a major activity center. The location of the split station would support the needs of people traveling to Broadway St. while supporting future plans such as the possible addition of a trolley line. Coordination with the 'Bring Back Broadway' committee will be needed in order to remain up-to-date on project developments in the future.

Figure 2-68 Optional Station on 2nd St.

Conclusion

The alternatives recommended for further study will provide a direct connection from the Metro Gold Line at Alameda St. to the existing underground 7th St./Metro Center Station with at least three new stations in between. As the project continues to be refined from an environmental and engineering perspective, alignments, station locations and configurations may need to be adjusted. In addition, supporting ancillary facilities such as traction power substations, ventilation shafts, and station emergency exits will be detailed in the next phase of the study.

Section 3 Transportation Issues and Analysis

3.1 Introduction

This section summarizes the existing transportation system in downtown that would be affected by the proposed Regional Connector. Impacts to the transportation system for each alternative under consideration (At-Grade Emphasis LRT, Underground Emphasis LRT, TSM, and No Build) will be provided in the following sections.

3.2 Transit Analysis

The build alternatives consist of LRT links. Other transit technologies such as monorail, personal rail transit, "people mover," commuter rail, heavy rail, and trolley/streetcars were eliminated from consideration because they require a transfer, are incompatible with the current transportation system, or are not cost-effective.

In addition, year 2030 transit ridership forecasts for the build alternatives are presented. Only transit lines that parallel the proposed operating plans for the Regional Connector project (between Pasadena and Long Beach, and between East Los Angeles and Culver City) are presented in this section. A more detailed listing of all lines passing through the downtown area, all of which could potentially provide transfers to the Regional Connector, can be found in the Section 1.5.

3.2.1 Existing Service

Downtown Los Angeles has the highest concentration of transit service in the County. Ten transit operators manage three existing rail transit lines, two rail lines currently under construction and scheduled for operation by 2010, and 112 bus routes through the PSA. The transit operators are:

- Antelope Valley Transit Authority (AVTA)
- Gardena Municipal Bus Lines
- City of Santa Clarita
- City of Santa Monica (Big Blue Bus)
- Foothill Transit
- LADOT
- Metro
- Montebello Bus Lines
- Orange County Transportation Authority (OCTA)
- Torrance Transit

Figure 3-1 Project Study Area

Services vary considerably in speed, frequency and capacity. The types of service provided include traditional line-haul bus service, peak-hour freeway express buses, downtown circulator shuttles, LRT, and HRT. Although Metro and LADOT carry the majority of the passengers, other operators provide peak-hour, peak direction commuter bus service as well. In addition to public transit services, several high-rise office tenants also offer shuttle bus service to Union Station for their employees.

Almost all streets in the downtown area are served by buses during the peak hours, often with five minute or shorter headways (frequency). Bus service runs in a grid pattern with the predominant flow of passengers traveling in an east-west direction. There are heavily utilized bus lines that run in the north-south direction as well. The most heavily-served streets are 1st St., the 5th St./6th St. couplet, Hill St., Broadway, the Main St./Spring St. couplet, and the Grand Ave./Olive St. couplet.

Almost all of the bus lines in the PSA could double as rail feeder lines and provide transfers to the Metro Rail system along the Regional Connector, as the Regional Connector stations would be positioned within two or three blocks of most bus lines serving the downtown area.

Tables 3-1 through 3-4 summarize the bus lines that currently parallel Metro Rail lines that would feed into the Regional Connector. Each table shows the bus routes with their destinations, hours of operation, and peak hour frequencies.

Table 3-1 Bus Routes Paralleling the Future Gold Line Eastside Extension Service					
Operator	Line	Mode	Weekday Hours of Operation	Peak Hour Frequency	Route Description
Metro	18	Local Bus	24 Hours	3 mins	Wilshire Center - Montebello via 6th St. and Whittier Blvd.
Metro	30/31/ 330	Local/Limited Stop Bus	24 Hours	4 mins	Pico-Rimpau - Monterey Park via Pico Blvd. and E 1st St.
Metro	62	Local Bus	5AM-11PM	15 mins	Hawaiian Gardens via Telegraph Rd.
Metro	66/366	Local/Limited Stop Bus	4AM-1AM	2 mins	Wilshire Center - Montebello via 8th St. and Olympic Blvd.
Metro	68/84	Local Bus	24 Hours	8 mins	West LA - Montebello via Washington Blvd. and Cesar Chavez Ave.
Metro	720	Rapid Bus	4AM-1AM	4 mins	Wilshire Blvd. - Whittier Blvd. Rapid
Metro	770	Rapid Bus	5AM-9PM	8 mins	Garvey Ave. – Cesar Chavez Ave. Rapid
LADOT	Dash Boyle Heights/East LA	Dash	7AM-7PM	20 mins	Herbert & Whittier via Wabash, Gage Ave. and Rowan
Montebello	40	Local Bus	5AM-10PM	8 mins	Montebello and Whittier via Beverly Blvd.
Montebello	341	Limited Stop Bus	7AM-9AM 4PM-6PM	30 mins	Montebello and Whittier via Beverly Blvd.
Montebello	342	Limited Stop Bus	7AM & 5PM	One Trip	Montebello and Whittier via Beverly Blvd.
Montebello	343	Limited Stop Bus	7AM-8AM 5PM-6PM	30 mins	Montebello and Whittier via Beverly Blvd.

Table 3-2 Bus Routes Paralleling the Existing Pasadena Gold Line Service					
Operator	Line	Mode	Weekday Hours of Operation	Peak Hour Frequency	Route Description
Metro	78/79/ 378	Local/ Limited Stop Bus	5AM-1AM	10 mins	Arcadia via Huntington Dr. and Las Tunas Dr.
Metro	81/381	Local/ Limited Stop Bus	5AM-1AM	7 mins	Eagle Rock – Exposition Park via Figueroa St.
Metro	83	Local Bus	24 Hours	10 mins	Eagle Rock via York Blvd.
Metro	485	Freeway Express Bus	5AM-12AM	20 mins	Altadena via El Monte Busway, Oak Knoll Ave. and Lake Ave.

Table 3-3 Bus Routes Paralleling the Existing Blue Line Service					
Operator	Line	Mode	Weekday Hours of Operation	Peak Hour Frequency	Route Description
Metro	53	Local Bus	24 Hours	6 mins	Carson via Central Ave.
Metro	55/355	Local/Limited Stop Bus	24 Hours	5 mins	Imperial Blue/Green Lines via Compton Ave.
Metro	60	Local Bus	24 Hours	6 mins	Artesia Blue Line via Long Beach Blvd.
Metro	753	Rapid Bus	5AM-9PM	10 mins	Central Ave. Rapid
Metro	760	Rapid Bus	5AM-8PM	8 mins	Long Beach Blvd. Rapid Bus
Metro	445	Freeway Express Bus	5AM-7PM	30 mins	San Pedro via Harbor Transitway, 1st St. and Pacific Ave.
Metro	446/447	Freeway Express Bus	5AM-12AM	15 mins	San Pedro via Harbor Transitway, Avalon Bl. and Pacific Ave.

Table 3-4 Bus Routes Paralleling the Future Exposition Line Phase 1 Service					
Operator	Line	Mode	Weekday Hours of Operation	Peak Hour Frequency	Route Description
Metro	33/333	Local/Limited Stop Bus	24 Hours	2 mins	Santa Monica via Venice Blvd.
Metro	35/335	Local/Limited Stop Bus	4AM-12AM	10 mins	West LA via Washington Blvd.
Metro	37	Local Bus	4AM-11PM	10 mins	Beverly Hills via Beverly Blvd./West LA via Adams Blvd.
Metro	40	Local Bus	24 Hours	10 mins	Redondo Beach via Hawthorne Blvd.
Metro	42	Local Bus	5AM-12AM	12 mins	LAX via Martin Luther King Jr. Blvd.
Metro	439	Freeway Express Bus	5AM-9PM	40-60 mins	Aviation Green Line via Culver City
Metro	740	Rapid Bus	6AM-9PM	15 mins	Hawthorne Blvd. Rapid
LADOT	CE437	Freeway Express Bus	7AM-9AM 4PM-6PM	15-30 mins	Venice/Marina del Rey/Culver City
Big Blue Bus	10	Freeway Express Bus	6AM-9PM	15 mins	Santa Monica (Nonstop) via I-10

3.2.2 No Build Alternative

Transit service under the No Build Alternative is focused on the preservation of existing services and projects. By the projection year of 2030, the Metro Expo Line and the Metro Gold Line Eastside Extension Phase 1 will have opened, and some bus service will have been reorganized and expanded to provide connections with the new rail lines. The transit network within the PSA will otherwise be largely the same as it is now. The anticipated year 2030 No Build transit services are summarized here:

Rail Lines:

- Metro Gold Line from Union Station to Pasadena. This route is a 13.6-mile light rail transit line along the northeastern edge of the PSA.

- Metro Blue Line from Downtown Long Beach to 7th St./Metro Center Station. This 22-mile LRT line travelling south from the PSA is the first modern light rail system in Los Angeles.

- Metro Red and Purple Lines from North Hollywood and Wilshire/Western to Union Station through the 7th St./Metro Center Station. These routes comprise a 17.4-mile HRT system that connects 7th St./Metro Center Station to Union Station and other major destinations in downtown Los Angeles, Hollywood, and the San Fernando Valley. The two lines share tracks within the PSA. Because light rail trains cannot operate on heavy rail tracks, LRT passengers wishing to travel between 7th St./Metro Center Station and Union Station are required to transfer to the Metro Red and Purple Lines or buses such as Metro Local or LADOT DASH routes.

- Metro Gold Line Eastside Extension from Union Station to East Los Angeles. Lying to the east of Downtown Los Angeles, this six-mile long LRT line is expected to be complete and operational in 2009.

- Metro Expo Line from 7th St./Metro Center Station to Culver City. This 8.5-mile route is scheduled to open in 2010, directly connecting Downtown Los Angeles with the dynamic Westside.

The Metro Blue Line, which ends at 7th St./Metro Center Station, does not directly connect to the Metro Gold Line, as seen in Figure 3-2. Currently, passengers have to use the Metro Red and Purple Lines or buses to travel between 7th St./ Metro Center Station and the Metro Gold Line at Union Station.

Bus Lines:

Bus service in the PSA would predominantly remain the same through the year 2030 No Build condition with increased headways for some of the heavily travelled lines. Increases along the lines listed in Tables 3-1 through 3-4 would help transport more passengers into downtown along the rail corridors that would be joined by the Regional Connector.

Commuter Service:

Amtrak and Metrolink would continue to provide commuter rail services to Union Station from other cities in the region. Arriving passengers have the choice of transferring to the Metro Red and Purple Lines, LADOT DASH bus service, or other buses or shuttles to continue their trips to the Central Business District or other parts of the City.

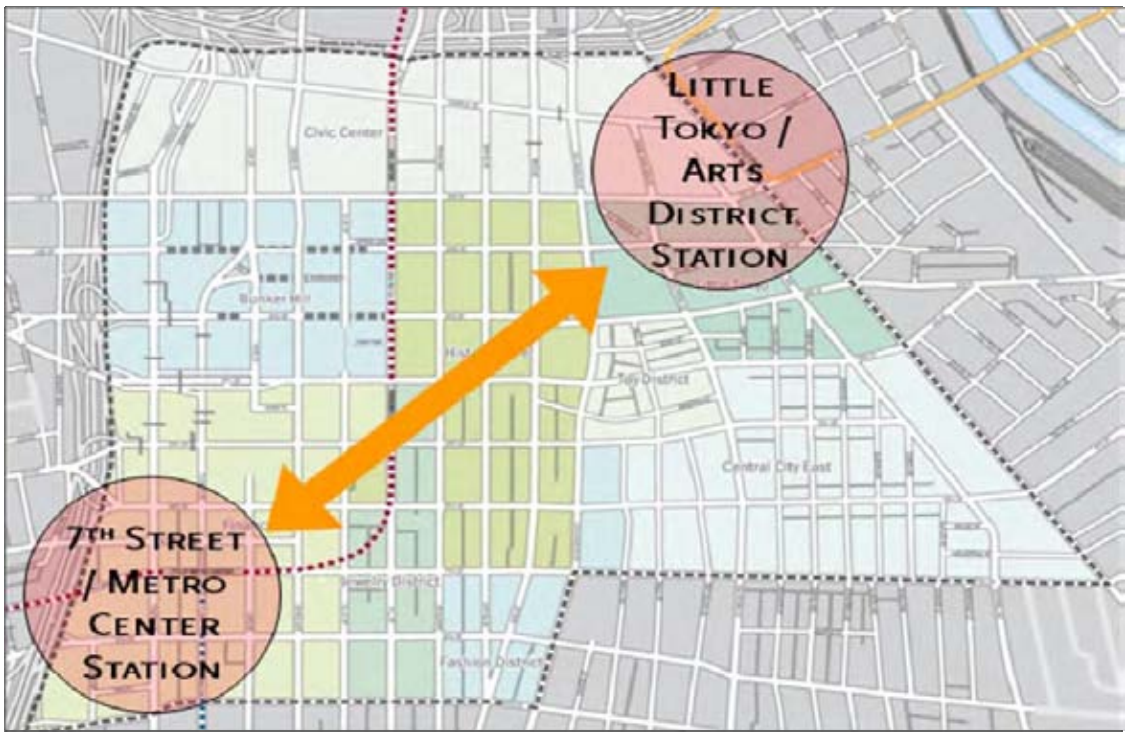

Figure 3-2 Gap in the Light Rail System

3.2.3 Transportation System Management (TSM) Alternative

This alternative consists of shuttle bus routes instead of a light rail link between the 7th St./Metro Center Station and Union Station. Two shuttle routes are designed to move passengers between the two stations:

Grand/Temple/Los Angeles Alignment: The alignment is assumed to follow the same route as part of the existing LADOT DASH Route B service, proceeding from Union Station to 7th St./Metro Center using Los Angeles St., Temple St., and Grand Ave. Shuttle buses will run less than eight minutes apart, providing coverage of the Bunker Hill and Civic Center areas.

Figueroa/Flower/2nd/3rd/Alameda Alignment: This route will utilize the existing northbound bus-only lanes on Figueroa St., 2nd St. and 3rd St., which are lightly used by other bus lines. The alignment passes by both the Little Tokyo/Arts District Station and Union Station, and provides good coverage of Little Tokyo and the southern edge of the Civic Center.

The shuttle routes would be operated by Metro, and could use vehicles ranging from 30-foot shuttle buses to 60-foot articulated buses. They would run every few minutes during peak periods, and peak hour bus-only lanes would be created where possible by restricting parking on streets that do not already have dedicated all-day bus lanes. Similar to the Metro Rapid Bus lines, a TPS will also be employed where possible to increase bus speed and efficiency.

3.2.4 At-Grade Emphasis LRT Alternative

The alignment of this alternative extends from the underground 7th St./Metro Center Station, heads north under Flower St., resurfaces to at grade north of 4th St. in the case of Option A (or just north of 5th St. in the case of Option B), enters Bunker Hill, and turns northeast through a new entrance to the existing 2nd St. tunnel. The alignment continues along 2nd St. and splits into an at-grade couplet configuration traveling north Main and Los Angeles Streets with one track on each roadway. Then it heads east on Temple St., realigns into a dual track configuration just north of the Little Tokyo/Arts District Station on Alameda St.

Due to the high volume of trains that will traverse the Regional Connector, an automobile underpass and pedestrian overpass would be constructed at the intersection of Temple and Alameda Streets to eliminate pedestrian-train and automobile-train conflicts.

This alignment includes both underground and at-grade configurations, with 46 percent of the route underground (38 percent if the underground tracks on Flower St. surface at 5th St. instead of 4th St.), serving the Civic Center, Grand Ave., and the Financial District. Conversion of 2nd St. to a pedestrian-friendly transit mall is assumed. This alternative will reduce the number of traffic lanes and on-street parking spaces. Under this plan, at-grade LRT construction activities will reduce the automobile capacity of 2nd St. As a result, traffic is likely to divert to adjacent parallel streets such as 1st St. and 3rd St., but the roadway capacity along these streets will remain unchanged, as with the No Build Alternative. Congestion along these streets will likely increase.

3.2.5 Underground Emphasis LRT Alternative

This alignment begins at the underground 7th St./Metro Center Station and heads north under Flower St., then turns northeast under the Grand Avenue Project development and heads east under the 2nd St. tunnel. It continues east under 2nd St. until it rises to street level on the lot northeast of 2nd St. and Central Ave. and crosses Alameda St. to connect to the Metro Gold Line tracks.

This alignment is 94 percent underground, with a single at-grade crossing at 1st and Alameda Streets. This grade crossing will feature an automobile underpass and pedestrian overpass so as to remove nearly all conflicts between pedestrians, automobiles, and trains at this intersection. The underground stations provide service to the Civic Center, Little Tokyo, Grand Ave., and Financial Districts. Due to the fact that this alignment is predominantly underground, permanent impacts on traffic operations, roadway capacity and mobility along 2nd St. will be minimized. Construction impacts would occur at station sites, portals, and above cut and cover tunnel sections, but would be temporary.

3.2.6 Ridership

For all of the alternatives under consideration, ridership is affected by travel time, fares, length of segments, and choice of alignment and configuration. One major benefit of a project like this is the increase in the overall transit ridership that the new service produces. The change in ridership is estimated for all relevant transit services in the area including buses and rail.

Ridership generated by each alternative, based on year 2030 forecasts, was then compared to that produced by the No Build and TSM Alternatives. Model runs were performed for the No Build, TSM, At-Grade Emphasis LRT, and Underground Emphasis LRT Alternatives.

Table 3-5 shows the projected year 2030 total transit trips for each alternative. The build alternatives would increase ridership on urban rail (Metro Rail) while reducing bus ridership and slightly reducing commuter rail (Metrolink) ridership, which can be explained as a shift from other transit services to rail when the Regional Connector is built. For example, a small share of the riders currently using Metrolink's Cal State LA, Montebello, Commerce, and Norwalk stations may switch to the Metro Gold Line Eastside Extension or the Metro Blue and Green Lines to take advantage of the improved trip times to downtown. The results suggest that fewer than 400 passengers would make this switch.

The Regional Connector would attract riders for crosstown trips that can be taken without transferring between transit lines. Since the number of new rail riders is greater than the reduction in bus riders, the Regional Connector is anticipated to attract more commuters to the transit system.

For urban rail trips, the net increases over the No Build Alternative range from about 12,200 daily trips for the At-Grade Emphasis LRT Alternative Option A and 13,500 for the At-Grade Emphasis LRT Alternative Option B to 16,000 for the Underground Emphasis LRT Alternative. When compared to the TSM Alternative, the added daily trips range from 13,000 for the At-Grade Emphasis LRT Alternative Option A, 14,300 for the At-Grade Emphasis LRT Alternative Option B, to 16,900 for the Underground Emphasis LRT Alternative. Commuter rail would experience only a slight decrease in ridership.

Overall, total transit trips under the build alternatives increase by 0.5 to 0.7 percent, or 7,600 to 10,200 new daily trips, when compared to the No Build and TSM Alternatives, respectively, due to the improved transit connectivity and frequency provided by the Regional Connector. The increase in boarding's on the light rail lines feeding into the Regional Connector will be 7 to 10 percent compared to No Build because more people will be attracted to the system by the faster service. The new reduced transfer light rail service will also eliminate 17,000 to 20,000 daily transfers to and from the Metro Red and Purple Lines.

Of the two build alternatives, the Underground Emphasis LRT Alternative tends to capture the greatest amount of new transit trips, in terms of both urban rail trips and total transit trips, while the At-Grade Emphasis LRT Alternative follows closely behind.

Table 3-5 Year 2030 Daily Transit Trips

	No Build	TSM	At-Grade LRT (Option A)	At-Grade LRT (Option B)	Underground LRT
Local Bus	839,375	839,166	837,009	836,702	836,181
Express Bus	30,787	30,512	30,723	30,716	30,698
Transitway Bus	102,396	101,866	101,655	101,597	101,563
Rapid Bus	211,266	214,022	210,295	210,185	209,886
BRT	7,463	7,463	7,428	7,413	7,458
Bus Subtotal	1,191,287	1,193,029	1,187,110	1,186,613	1,185,786
Urban Rail	248,194	247,377	260,391	261,660	264,242
Commuter Rail	76,337	76,362	75,934	75,934	75,989
Transit Subtotal	1,515,818	1,516,768	1,523,435	1,524,207	1,526,017

When comparing the TSM and No Build Alternatives, the TSM Alternative results in a nominal increase in bus ridership of about 1,700 additional daily trips, which appears to be the effect of increased frequency coupled with the shuttle bus connection between 7th St./Metro Center and Union Station.

Since a high concentration of bus service already exists in the downtown area linking the two stations, the proposed shuttle bus service is unlikely to function as an essential improvement. The difference in total transit ridership between the TSM and No Build Alternatives is only 950, which is not as dramatic as the increases associated with the LRT build alternatives. Accordingly, the proposed build alternative shows much better ridership performance than the No Build and TSM Alternatives, with the Underground Emphasis LRT Alternative expected to produce the highest amount of new ridership.

Urban Rail Boardings

Table 3-6 summarizes the year 2030 forecasted rail line daily boardings for each of the alternatives. Daily boardings represent the total number of boardings in the North-South Line and East-West Line connected by the Regional Connector, including the Metro Gold Line to Pasadena, the Metro Gold Line Eastside Extension, the Metro Blue Line and the Metro Expo Line. New boardings are presented for each alternative as increments over the No Build and TSM alternatives.

Although the TSM Alternative has a total daily ridership higher than the No Build Alternative, it has the fewest urban rail boarding's, resulting from the additional transfers needed when using the new shuttle buses to link 7th St./Metro Center Station and Union Station. The build alternatives will result in significant increases in rail boarding's along the North-South and East-West LRT lines, compared to both the No Build and TSM Alternatives, ranging from about 10,900 to 15,500 daily boarding's.

Table 3-6 Year 2030 Urban Rail Boardings on LRT Lines Joined by the Regional Connector

Alternative	Daily Boardings	Incremental New Urban Rail Boardings Over No Build	Incremental New Urban Rail Boardings Over TSM	Boardings at New Stations
No Build	154,805	N/A	962	N/A
TSM	153,843	N/A	N/A	N/A
At-Grade Emphasis LRT Option A	165,691	10,886	11,848	15,098
At-Grade Emphasis LRT Option B	167,615	12,810	13,772	15,057
Underground Emphasis LRT	169,288	14,483	15,445	12,457

As for total daily ridership on the entire transit system, the Underground Emphasis LRT Alternative is expected to produce the highest number of boardings each day, though it will yield fewer boardings at the new stations than the at-grade alternative.

3.3 Roadway Analysis

This section summarizes traffic volumes and operating conditions at key roadway segments and intersections within the PSA. Existing daily, AM peak and PM peak traffic volume data were obtained from LADOT. An analysis under existing conditions was performed for the key roadway segments using daily traffic volumes and the key intersections using AM and PM peak hour turning movement data.

The roadway segment analysis was performed using a Volume-to-Capacity (V/C) ratio of the average daily traffic (ADT). Existing volumes were obtained from LADOT and the capacity was based on the roadway's General Plan facility type classification.

For intersections, the AM and PM peak hour volumes were analyzed using the Intersection Capacity Utilization (ICU) methodology, which determines a V/C ratio based on the critical intersection approach movements and a corresponding Level of Service (LOS). The LOS is a qualitative measure used to describe traffic flow conditions, ranging from excellent flow (LOS A) to overloaded, stop-and-go conditions (LOS F). Level of service definitions and corresponding V/C ranges are presented in Table 3-7.

Tables 3-8 through 3-10 summarize the existing operating conditions for the key intersections, roadway segments, and freeways in the PSA. All of the key study intersections currently operate at LOS D or better during both the AM and PM peak hours. The only exception is the intersection of Alameda and 1st Streets, which currently operates at LOS F in the AM peak hour.

Table 3-7 Level of Service Definitions		
Level of Service	Volume/Capacity Ratio	Definition
A	0.000 - 0.600	FREE FLOW. No vehicle waits longer than one red light and no approach phase is fully used.
B	0.601 - 0.700	REASONABLY FREE FLOW. An occasional approach phase is fully utilized; many drivers begin to feel somewhat restricted within groups of vehicles.
C	0.701 - 0.800	STABLE FLOW. Occasionally drivers may have to wait through more than one red light; backups may develop behind turning vehicles.
D	0.801 - 0.900	APPROACHING UNSTABLE FLOW (acceptable for urban settings). Delays may be substantial during portions of the rush hours, but enough lower volume periods occur to permit clearing of developing lines, preventing excessive backups.
E	0.901 - 1.000	UNSTABLE FLOW (practical capacity). Represents the most vehicles intersection approaches can accommodate; may be long lines of waiting vehicles through several signal cycles.
F	>1.000	FORCED OR BREAKDOWN FLOW. Backups from nearby locations or on cross streets may restrict or prevent movement of vehicles out of the intersection approaches. Tremendous delays with continuously increasing queue lengths.

Most of the key roadway segments currently operate at LOS D or better except for three locations which operate at LOS E. Two of these locations are on 2nd St. and the third location is on Alameda St.

All of the freeways serving downtown operate at LOS F during peak hours in at least one direction. As evidenced by the previous tables, traffic congestion on the local freeways is worse than on streets in the PSA. This is largely because freeways congregate both downtown-bound traffic and traffic passing through to other areas. On I-10 east of downtown, and on SR-60 and US-101, traffic operates at a speed acceptable for urban settings in the reverse peak direction during peak hours (i.e., away from downtown in the mornings and toward downtown in the evenings). However, I-10 west of downtown and I-110/SR-110 operate at LOS F in both directions during both commute peaks.

In order to estimate the impacts of the proposed alternatives on the downtown roadway system, future traffic volumes were projected for the year 2030. The travel demand model was used to identify the annual growth rate at key intersections and roadway segments between the model base year and the 2030 forecast year. At most of the key locations, the model's annual growth rate was found to be around one percent or less. Consequently, a conservative annual growth rate of one percent was used to forecast the existing (2007) traffic volumes over 23 years to the year 2030 horizon. However, at several locations where the model growth rate substantially exceeded one percent, the greater rates from the model were utilized. This occurred along Flower St., where an annual growth rate of 1.4 percent was used, and in the southbound direction on Alameda St., where an annual growth rate of 1.75 percent was used.

Based on the future daily and peak hour traffic volumes that were developed, the future LOS at each key intersection and roadway segment location was calculated for the No Build, TSM and build alternatives. In general, the difference in future traffic volumes between the No Build and TSM Alternatives is minimal; for this AA, it is assumed that they will be the same. For each build alternative, the traffic impacts were compared to the No Build and TSM Alternatives. Vehicular circulation through the downtown area will be affected by the proposed project, but the level of impact will depend on the alternative alignment being evaluated, as noted in the following sections.

At-Grade Emphasis LRT Alternative

For the at-grade segments of the At-Grade Emphasis LRT Alternative, the two LRT tracks will typically occupy a 26-foot wide surface right-of-way bordered by mountable curbs. It is expected that this width will increase to 39 feet at center platform station locations. Vehicular and pedestrian crossings would be limited to traffic signal-controlled intersections, with the signal phasing modified to provide adequate green time for the LRT vehicles to safely cross. For safety reasons, no uncontrolled mid-block vehicular crossings of the tracks would be permitted. Access to existing parking structures, parking lots, loading docks and commercial frontage will be affected by the at-grade LRT facilities. Left-turn parking access and egress is presently allowed at many downtown sites. However,

the at-grade LRT facilities will eliminate uncontrolled mid-block left-turns, and thus modify existing approach and departure traffic patterns.

The proposed At-Grade Emphasis LRT alignment travels at-grade along 2nd St. and it is assumed that this street would be dedicated as a transit-only roadway between the tunnel and Los Angeles St. This segment of 2nd St. would be closed to through traffic and provide only emergency vehicle access and local access to adjacent properties. As a result of this proposed change in street circulation, through traffic currently using 2nd St. would be diverted to parallel roadways such as 1st and 3rd Streets. East of Los Angeles St., 2nd St. would maintain its current physical features and operating characteristics.

The one-way transit couplet near City Hall along Main and Los Angeles Streets between 2nd and Temple Streets would consist of a single LRT track along each roadway. Both Main and Los Angeles Streets are wide enough to accommodate a single track and maintain acceptable vehicular operations. The curb-to-curb width of Temple St., between Main and Alameda Streets, is 62 to 71 feet, leaving one lane of traffic in each direction with potentially mountable curbs for use by emergency vehicles. Traffic operations along this segment of Temple St. will be affected by the lane reduction.

To minimize conflicts between rail, vehicular, and pedestrian traffic, and to minimize delays at the intersection of Temple and Alameda Streets, a vehicular underpass and a pedestrian overpass are proposed along Alameda St. to route the through traffic beneath the rail tracks and Temple St. Temple St. and the rail tracks would remain at-grade and the existing at-grade segment of Alameda St. would be lowered to pass under Temple St. Through traffic traveling north and south on Alameda St. would operate unimpeded without being stopped or delayed at the intersection. Through traffic traveling east and west on Temple St. would continue to operate at-grade with a signal to control the movements between the vehicular and rail modes of transportation. In addition, a one-lane southbound at-grade frontage road would be provided along Alameda St. to maintain access to the businesses and properties on the west side of the street.

Underground Emphasis LRT Alternative

The Underground Emphasis LRT Alternative alignment does not affect surface traffic except at the intersection of Alameda and 1st Streets, where the LRT alignment operates in an at-grade configuration. Consequently, vehicular circulation patterns along downtown streets adjacent to most of the alignment will continue to operate at current traffic flow patterns.

The future roadway LOS for this alternative will be the same as the No Build and TSM Alternatives except at the intersection of Alameda and 1st Streets. There, a vehicular underpass and pedestrian overpass are proposed to separate the heavy traffic volumes along Alameda St. from rail traffic to minimize delays. The proposed underpass would result in uninterrupted flow along Alameda St. in the north and south directions between 2nd and Temple Streets. Through traffic traveling east and west on 1st St. would continue to operate at-grade with a signal to control the movements between the vehicular and rail modes of transportation.

In addition, at-grade frontage roads would be provided along on both sides of Alameda St. south of the intersection, and on the southbound side of the street north of the intersection to maintain access to adjacent businesses and properties. A full northbound frontage road is infeasible because of the location of the rail tracks and the Metro Gold Line Eastside Extension's Little Tokyo/Arts District Station on the east (northbound) side of Alameda St.

The results of the future conditions LOS analysis at the key intersections and roadway segments for the No Build, TSM and build alternatives are presented in Tables 3-11, 3-12, and 3-13. During the AM peak hour, five intersections operate at LOS E or F for the No Build, TSM, and Underground Emphasis LRT Alternatives; this increases to seven intersections for the At-Grade Emphasis LRT Alternative.

Similarly, during the PM peak hour, five intersections operate at LOS E or F for the No Build and TSM Alternatives, versus only four for the Underground Emphasis LRT Alternative and 13 for the At-Grade Emphasis LRT Alternative. The roadway segment analysis provides similar results, with 12 segments operating at LOS E or F for the No Build, TSM and Underground Emphasis LRT Alternatives, and 14 for the At-Grade Emphasis LRT Alternative. It should be noted that the No Build, TSM and Underground Emphasis LRT Alternatives have six of the 12 locations operating at LOS F while the At-Grade Emphasis LRT Alternative has 11 of the 14 locations operating at LOS F.

3.3.1 Parking Evaluation

A preliminary parking analysis was performed to assess the number of on-street parking spaces that may be removed for the build alternatives. This section presents the effects that each alternative may have on the curb parking supply. In order to estimate parking losses, a field survey was performed to inventory the number of available on-street parking spaces. The street segments with an at-grade transit alignment were surveyed to collect the number of spaces and parking restriction information.

No Build, TSM, and Underground Emphasis LRT Alternatives

Neither the No Build nor the TSM Alternative would displace any existing parking spaces. The build alternatives will each have different parking impacts. With the proposed alignment almost completely underground, the Underground Emphasis LRT Alternative does not result in any loss of on-street parking spaces along 2nd or Flower Streets. However, the proposed underpass at 1st and Alameda Streets will result in the loss of existing parking spaces along the east side of Alameda St. near the intersection. Approximately 20 on-street spaces would be displaced. Construction of the Underground Emphasis LRT Alternative would temporarily displace parking spaces along the alignment, but they would be restored once work is completed.

At-Grade Emphasis LRT Alternative

The construction of at-grade tracks along 2nd St. and the need for adequate street widths to provide local access lanes will require the elimination of existing on-street parking and loading spaces to accommodate the At-Grade Emphasis LRT Alternative. This loss of parking may result in spill over to adjacent streets if parking on these streets is readily available. As shown in Table 3-15, the total number of parking spaces lost under the At-Grade Emphasis LRT Alternative will total 88, with 35 of the spaces located on 2nd St. between Hill and Los Angeles Streets. All of the lost parking spaces would be in the Civic Center area, and no parking would be displaced in Little Tokyo. In addition, nine spaces may also be lost along the south side of Temple St. west of Alameda St. due to the proposed underpass.

Table 3-15 Number of Existing Parking Spaces on 2nd Street																
Street	Side	Hill to Broadway			Broadway to Spring			Spring to Main			Main to Los Angeles			TOTAL		
		Park	Load	Drive-Way	Park	Load	Drive-way	Park	Load	Drive-way	Park	Load	Drive-way	Park	Load	Drive-way
2nd St	North	0	0	0	0	0	1	0	0	0	0	0	0	0	0	1
	South	9	1	0	7	0	1	4	4	1	10	0	9	30	5	11
TOTAL		9	1	0	7	0	2	4	4	1	10	0	9	30	5	12

Consequently, it will be necessary to implement mitigation measures, such as off-street parking facilities to replace the lost curb spaces. After the selection of a preferred alternative, Metro would have to work closely with the affected entities to develop plans to minimize the parking losses.

3.4 Summary of Transportation Analysis

In an effort to better inform decisions made on such a significant investment, this section provides a summary of major transportation issues such as ridership, traffic impacts and parking losses related to each alternative based on a comparative evaluation.

No Build Alternative

Implementation of the No Build Alternative will result in the lowest total daily transit ridership of 1.5 million passengers and the second fewest urban rail daily combined boardings of approximately 155,000 for the Metro Blue Line, Pasadena Gold Line, Gold Line Extension, and Expo Line.

For the No Build Alternative, two key intersections operate at LOS E and three operate at LOS F during the AM peak hour. The remaining intersections operate at LOS D or better. The number of intersections operating at LOS E and F is three and two, respectively, during the PM peak hour. In addition, 12 roadway segments operate at LOS E or LOS F.

This alternative will not displace any existing on-street parking or loading spaces or reduce the number of traffic lanes.

TSM Alternative

This alternative has the fewest daily urban rail boardings, about 154,000, for the Metro Blue Line, Pasadena Gold Line, Gold Line Extension, and Expo Line combined, since it consists of shuttle bus service. Although the TSM Alternative results in fewer rail boardings, it will produce approximately 1.5 million total transit trips each day, 950 more daily trips than the No Build Alternative. Thus, the TSM Alternative is expected to slightly improve overall transit service.

Like the No Build Alternative, the TSM Alternative has two key intersections operating at LOS E and three operating at LOS F during the AM peak hour. The remaining intersections operate at LOS D or better. The number of intersections operating at LOS E and F changes to three and two, respectively, during the PM peak hour. In addition, 12 roadway segments will operate at LOS E or LOS F.

Like the No Build Alternative, the TSM Alternative would not require the displacement of any existing on-street parking or loading spaces, or a reduction in traffic lanes.

At-Grade Emphasis LRT Alternative Option A

The At-Grade Emphasis Alternative with Option A ranks lowest with regard to ridership of the build LRT alternatives, with about 1.5 million total daily transit trips. However, it still creates 7,600 more daily trips than the No Build Alternative and 6,700 daily trips over the TSM Alternative. It also results in the fewest daily urban rail boardings of nearly 166,000 compared to Option B and the Underground Emphasis LRT Alternative, but far more than the No Build and TSM Alternatives.

The at-grade operation along 2nd St. will result in the reduction of roadway capacity and the diversion of through traffic to adjacent roadways such as 1st St. to the north and 3rd St. to the south. However, local access will be maintained to serve the adjacent businesses and office buildings. This shift in traffic flow patterns will cause seven key intersections to operate at LOS E or LOS F in the AM peak hour, and 13 during the PM peak hour. A total of 14 roadway segments will operate at LOS E or F, with the majority operating at LOS F.

The operation of at-grade LRT service along 2nd St. will necessitate the removal of 35 on-street parking and loading spaces. In addition, approximately 9 spaces may also be lost along the south side of Temple St. just west of Alameda St.

At-Grade Emphasis LRT Alternative Option B

The At-Grade Emphasis Alternative with Option B ranks second in ridership and urban rail boardings, with 1.5 million total trips and nearly 170,000 boardings each day. A comparison to the No Build and TSM Alternatives reveals that it will produce about 8,400 and 7,500 additional daily transit trips, respectively.

Option B is practically identical to Option A, except it has a longer at-grade section along Flower St. and an at-grade center platform station at the World Trade Center. As noted previously, at-grade operation along 2nd St. will result in the reduction of roadway capacity and the diversion of through traffic to adjacent roadways such as 1st St. to the north and 3rd St. to the south. However, local access will be maintained to serve the adjacent businesses and office buildings. Consequently, seven key intersections will operate at LOS E or LOS F in the AM peak hour, 13 during the PM peak hour. A total of 14 roadway segments will operate at LOS E or F with the majority of these locations operating at LOS F.

The at-grade LRT service along 2nd St. will displace a total of 35 on-street parking and loading spaces. In addition, approximately 9 spaces may be lost along the south side of Temple St. just west of Alameda St.

Underground Emphasis LRT Alternative

The ridership evaluation shows the Underground Emphasis LRT Alternative to be the best performer, producing a total of 1.5 million daily transit trips. This alternative would result in almost 10,200 more daily transit trips than the No Build Alternative, and 9,300 more than the TSM Alternative. It would also yield the most daily urban rail boardings at 170,000.

Due to its mostly underground configuration, this alternative will not compromise existing roadway capacity. Similar to the No Build and TSM Alternatives, five key intersections will operate at LOS E or LOS F during the AM peak period, four during the PM peak hour. The proposed Alameda St. underpass at 1st St. will help improve the operation of the intersection. Like the No Build and TSM Alternatives, a total of 12 roadway segments operate at LOS E or LOS F. Minor diversions of several turn movements at the intersection of Alameda and 1st Streets will occur due to the proposed underpass and associated frontage road configurations.

The proposed underpass along Alameda St. is expected to displace about 20 parking spaces in the northbound direction south of 1st St.

3.5 Conclusions

Each of the alternatives was evaluated in terms of ridership, potential traffic impacts and parking losses. As explored above, the build LRT alternatives will result in significant increases in total transit ridership and urban rail boardings, with the Underground Emphasis LRT Alternative achieving the highest ridership performance.

From a roadway and intersection evaluation perspective, the Underground Emphasis LRT Alternative runs mostly underground, so there will be minimal disruption to traffic operations and flow patterns. The existing downtown roadway capacity will be maintained, and access to businesses and office buildings will not be compromised. In most cases, existing turn movements will be permitted, except at the proposed Alameda St. underpass and frontage roads, where several turn movements will be prohibited and traffic will need to use alternate routes. Overall, the operating conditions at the key intersections and roadway segments will mirror those of the No Build and TSM Alternatives.

On the other hand, the At-Grade Emphasis LRT Alternative will reduce roadway capacity along several segments due to the addition of grade crossings and street-running tracks. The proposed dedication of 2nd St. as a transit roadway will alter traffic flow patterns in the vicinity of the alignment. Local access will be maintained, but through traffic will be diverted to adjacent parallel streets, such as 1st and 3rd Streets. Crossing the rail tracks will be prohibited except at controlled signalized intersections. A vehicular underpass and pedestrian overpass are proposed near the junction with the Metro Gold Line Eastside

Extension tracks at 1st and Alameda Streets to minimize vehicular, pedestrian, and rail conflicts as wells as reduce potential delays along Alameda St. Operating conditions at the key intersections and roadway segments will be worse than the No Build and TSM Alternatives.

With respect to on-street parking and loading spaces, the At-Grade Emphasis LRT Alternative will displace 35 spaces along 2nd St. An additional 9 spaces may be removed along the south side of Temple Street in the block west of Alameda St. to accommodate the underpass. In comparison, the Underground Emphasis LRT Alternative is expected to displace about 20 parking spaces along the east side of Alameda St. south of 1st St. to accommodate the proposed underpass and frontage roads.

Section 4 Affected Environment and Environmental Issues

4.1 Introduction

The alternatives evaluated for the Regional Connector AA would have direct and indirect effects on the physical environment. This section of the AA describes the existing resource environment and analyzes the potential environmental impacts associated with implementation of the promising build alternatives: the At-Grade Emphasis LRT and the Underground Emphasis LRT. At the conclusion of this document – Section 4.20 – is a summary and comparison of the build alternatives with the No Build Alternative and the TSM Alternative.

The specific environmental impact resource areas analyzed in this section include: land use and economic development, displacement and relocation of existing uses, community and neighborhood, visual and aesthetics, air quality, noise and vibration, ecosystems/biological resources, geotechnical (including subsurface and hazardous materials), water resources, energy, historic, archaeological and Paleontological resources, parklands and other community facilities, economic and fiscal, safety and security, construction impacts, growth inducing, environmental justice, and major utilities.

The following analysis discusses the potential environmental impacts from the construction and operation of the alternatives. Construction impacts would be temporary, while operational impacts would be on-going. As appropriate, the potential site-specific impacts are described based on available information and the current planning effort. As subsequent efforts become more detailed, revised and/or further assessments of the potential environmental effects will be prepared, evaluated and described in a future (EIR/EIS) for the project.

4.2 Land Use and Economic Development

This section examines the existing land uses and associated policies within the Regional Connector PSA, and evaluates their compatibility with the build alternatives. The section also identifies areas for potential growth in response to the new transit service, as well as other impacts that the project might have on development within downtown Los Angeles. Refer to Section 4.3, Displacement and Relocation of Existing Uses, and Section 4.4, Community and Neighborhood Impacts, for additional discussion related to land use and economic development.

4.2.1 Affected Environment

4.2.1.1 Regulatory Framework

The following are the land use plans, community plans, and redevelopment plans and projects affecting the PSA, as well as brief assessments of their compatibility with the two build alternatives.

General Plan Framework: The Los Angeles General Plan Framework, adopted in December 1996, is the citywide portion of the City's General Plan, which is intended to guide the City's long-range growth and development. The General Plan Framework anticipates fast-paced population growth and outlines methods for directing growth toward selected high-density areas where infrastructure is readily available, rather than allow all areas of the City to grow in an uncontrolled fashion. The study identifies downtown as one of the key growth areas, and calls for enhancements to the County's rail system, including extensions and additional feeder bus service.

Central City Community Plan: The Land Use Element of the General Plan splits the City into 35 community plan areas, each with detailed programs targeted at local growth and neighborhood improvements. The entire Regional Connector PSA lies within the Central City Community Plan district. This plan calls for creating dense residential neighborhoods with a variety of housing types, improving the functionality of the area's commercial districts, encouraging the development of additional rail transit, retaining the scale and appearance of existing areas, and encouraging job-rich land uses. As shown in Figure 4-1, the Central City Community Plan area is bounded by Cesar Chavez Ave. on the north, the Santa Monica Freeway (I-10) on the south, the Harbor Freeway (SR-110) on the west, and Alameda St. on the east. In response to the recent increase in housing units downtown, the plan seeks to develop neighborhood-supporting businesses and enhance the safety and cleanliness of the area. The plan heavily promotes transit supportive land uses, such as high-density residential developments, regional entertainment and cultural centers, space for small start-up businesses, retail plazas, nighttime entertainment venues, hotels, and dense industrial and wholesale districts. Of particular importance to the Regional Connector, the plan notes that most of the traffic in the area is generated by pass-through travel between areas outside of downtown. As such, the plan expressly recommends providing better connections through downtown from the SR-110 corridor, including a light rail extension from 7th St./Metro Center Station to Union Station via Flower St., Bunker Hill, and Little Tokyo.

Transportation Element: The Transportation Element of the General Plan lists objectives and programs aimed at improving accessibility and long-term mobility within the City of Los Angeles. In the document, the City encourages the development of high capacity transit service along several corridors, including a "Downtown Connector" from either the San Pedro or Washington Stations to Union Station.

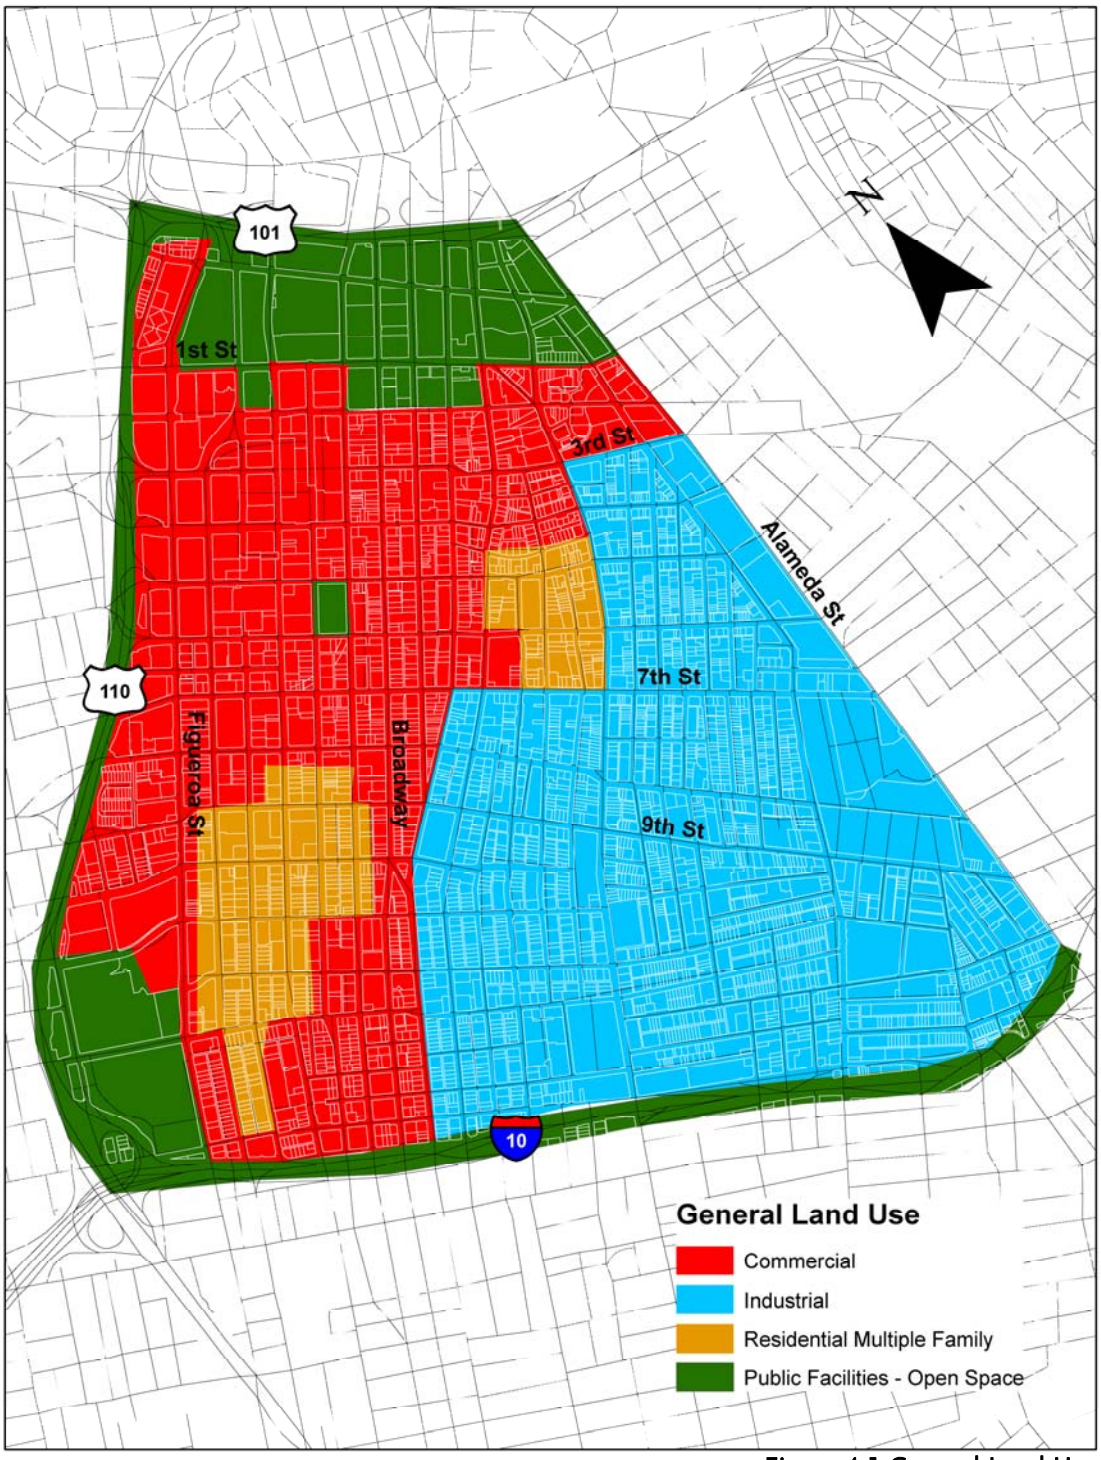

Figure 4-1 General Land Use

Civic Center Shared Facilities and Enhancement Plan: In 1997, the Civic Center Shared Facilities and Enhancement Plan established goals for creating a cohesive concentration of public office buildings linked by visually enhanced streets. The plan outlines a public services and business district which pedestrians could traverse in ten minutes or less. Central to the plan are linkages to other parts of downtown, including Union Station, the Historic Core, and the Music Center.

Feasibility Study for the Resurrection of the Red Car Trolley Services in the Los Angeles Downtown Area: The Community Redevelopment Agency of the City of Los Angeles (CRA) published the Feasibility Study for the Resurrection of the Red Car Trolley Services in the Los Angeles Downtown Area in July 2006, which examines their proposal to introduce a historic streetcar line running in a northeast-southwest direction from Chinatown to the Fashion District. The study discusses the usefulness of additional rail transit coverage within downtown, and emphasizes the importance of connectivity with other Metro Rail lines.

Business Improvement Districts (BIDs): The PSA also contains portions of six BIDs: Fashion BID, Downtown Industrial BID, Toytown BID, Historic Downtown BID, Downtown Center BID, and Little Tokyo BID. These organizations are funded by property assessments, and they seek to improve commerce in their areas through the provision of services such as security patrols, street and sidewalk cleaning, and promotional advertising. Stimulating business growth increases the number of jobs and shopping opportunities, which translates to higher volumes of trips to the district. As such, BIDs are generally supportive of better transit connections, since high quality transit service makes it easier for potential customers to travel to the area.

4.2.1.2 Existing Conditions

The PSA contains the financial core of downtown Los Angeles, and is one of the most job-dense areas in the City. In addition to being a major employment center, the PSA encompasses several retail, entertainment, and residential districts. Income levels of the residents vary greatly, from new luxury condominium developments in the western half of the PSA to single room occupancy hotels and homeless shelters in the eastern portion.

The land use patterns in the PSA consist of mostly commercial office buildings in the southwestern portion, public office buildings in the northern portion, and commercial manufacturing buildings in the southeast. There are pockets of residential uses, including adaptive reuse of older non-residential buildings, scattered through the PSA. The highest floor-area ratio, about 5.0, can be found in the Bunker Hill Redevelopment Area, the area roughly bounded by 1st St., Hill St., 7th St., and SR-110.

Just east of Bunker Hill lies an older office district (Historic Downtown) dating from the early part of the 20th century. Nearly all of the buildings contain ground floor retail establishments, making for a busy streetscape. The buildings in this area are substantially shorter than those on Bunker Hill, due to the city's 12-story height limit at the time of their construction.

In the easternmost part of the PSA lies one of the oldest industrial areas in the region. The buildings are short, usually only one to three stories, and vacant lots are more prevalent than in other parts of the PSA. Many of the empty lots are used as storage yards or surface parking lots. Though zoned for industrial manufacturing, some of the buildings have been converted into loft condominiums and rental housing units.

The PSA is already served by two rail lines and numerous bus lines run by ten operators. Transit riders in the PSA can reach most areas of the county on a single vehicle during peak hours.

As part of the redevelopment plans in the PSA, CRA has undertaken the following projects in the PSA, all of which would yield new transit-supportive land uses:

- 2nd St. Connection – This recently completed project connects two previously un-joined segments of Upper 2nd St. between Grand Ave. and Olive St. The connection was financed mostly by Metro and Surface Transportation Program-Local funds.

- Bunker Hill Design for Development – This proposal would amend the 1971 Design for Development (DFD) and increase the maximum floor area ratio in the Bunker Hill Redevelopment Area from 5.0 to 6.0. This would allow 20 percent more square footage that the current DFD. The proposal is currently in the Environmental Impact Report (EIR) phase.

- Grand Avenue Project – This large-scale redevelopment project is scheduled to break ground in Summer 2008 and will be complete by 2016. The project consists of a full-scale redesign of Grand Ave. as well as the addition of a 16-acre park in the Civic Center and 3.9 million square feet of retail, hotel, and office space.

- Parcel Y-1 Development –The existing Angels' Knoll Park would be developed into a third California Plaza office tower, potentially with retail and residential space. The project is currently in the DFD and EIR phase.

- Los Angeles Sports and Entertainment District/L.A. Live! – This project seeks to create a major sports and entertainment destination just south of the financial district, surrounding the existing Convention Center and Staples Center. Additional auditoriums and theaters, as well as retail and office space will be added by 2009. Condominium and rental apartment buildings are presently under construction. This redevelopment project is located one block south of the PSA.

- Colburn School Phase II – The new expansion to the performing arts school was completed in Fall 2007, and consists of a new dormitory, rehearsal hall, 12-story tower, library, teaching space, and performance lab. This project is located on the southeast corner of 2nd St. and Grand Ave.

- Park Fifth – An EIR is currently being prepared for a new high-rise residential building on 5th St. between Hill and Olive Streets. This project will contain market-rate condominium units, a five-star hotel, and ground floor commercial space.

- 8th & Grand Ave. – This is a condominium project with ground floor restaurants and retail located on 8th St. between Grand Ave. and Olive St. This project was approved by the CRA Board and the City Council in 2006.

- Mangrove Site – CRA issued a request for proposals which closed in late 2007 for the parcel adjoining the future Metro Gold Line Little Tokyo/Arts District Station at 1st and Alameda St. CRA hopes to pursue a mixed-use project on the site with market rate and affordable residential units, commercial space, and public parking. The site is located across Alameda St. from the PSA.

- Block 8 Mixed Use – This parcel in Little Tokyo is located between 2nd, 3rd, San Pedro, and Los Angeles Streets. The proposed development will include affordable rental units, market-rate condominium and rental units, commercial space, and open space. The site plan includes a mid-block walkway between San Pedro and Los Angeles Streets.

- Metropolis Project – Located on the southwest corner of 8th and Francisco Streets, this recently-approved development will add 2.8 million square feet of new condominium, office, hotel, and retail space.

- Little Tokyo Central Avenue Art Park – This project involves redeveloping the closed section of Central Ave. between Temple and 1st Streets into a landscaped community park and underground parking facility linking the existing Museum of Contemporary Art to the Japanese American National Museum.

- The Medallion – This project seeks to replace a surface parking lot with market-rate apartments and commercial space on a site located between Main, Los Angeles, 3rd, and 4th Streets. Construction on Phase 1 of the project has begun, and Phase 2 relies on the demolition of the existing Downtown Women's Center (see the following project).

- Downtown Women's Center Relocation/Expansion – This project will remove the existing Downtown Women's Center on San Pedro St. between 4th and 5th Streets in order to make way for the Medallion project. The city will renovate its Renaissance Building as the new Women's Center, and will provide an additional 75 permanent housing units and eight day rest beds for homeless women. CRA is currently reviewing development plans for the relocation/expansion project.

- Residential Hotels Rehabilitation Program – Under this plan, CRA will acquire approximately 30 single-room occupancy hotels, lease them to non-profit housing operators, and preserve the units as low-income housing. CRA cites public ownership as a means of cleaning up crime-ridden slum hotel areas within the PSA.

4.2.2 Evaluation Methodology

The following analysis addresses the compatibility of each build alternative with the existing land use patterns along the alignment, as well as the compatibility with existing land use plans and potential future development projects and trends. The analysis also reviews the transit coverage provided with each alignment and associated economic costs. The existing land use information is based on land use maps and field surveys.

4.2.3 Environmental Issues

Because the build alternatives – At-Grade Emphasis LRT and Underground Emphasis LRT- follow similar routes through downtown, the land use patterns in the areas they pass through do not vary significantly.

The Underground Emphasis LRT Alternative would have fewer negative impacts on the existing land use patterns than the at-grade alternative, since the Underground Emphasis LRT Alternative would not involve reducing the number of lanes available to automobile traffic on any streets or pose conflicts with the autos, as would the At-Grade Emphasis LRT Alternative. Further, reduction of traffic lanes on some streets associated with the At-Grade Emphasis LRT Alternative could create additional congestion (i.e., fewer lanes of travel) and costs associated with traffic management, which in turn could negatively affect downtown developments. However, the costs associated with construction of at-grade light rail would be less significant than costs associated with construction of the underground alignment.

Additionally, the underground alignment would have lower noise levels than an at-grade alternative during the operation phase. The Underground Emphasis LRT Alternative, as such, would be more compatible with existing and potential future residential development, the pace of which has sharply increased in the area over the last several years. However, an at-grade alignment and at-grade stations would still be consistent with the overall existing urban character of the area. Additionally, the at-grade stations on the At-Grade Emphasis LRT Alternative are more visible to potential riders and would impose fewer impediments to pedestrians quickly moving between the sidewalk and the boarding platform than underground stations.

As presented in Section 4.2.1.1, there are various land use plans, community plans, and redevelopment plans and projects affecting the PSA. The plans and projects are all generally supportive of improved transit linkages and mobility. Both of the build alternatives would be compatible with these goals and policies.

Because the station locations of both the at-grade and underground alternatives are proximate to each other, all of the alignments would provide nearly equivalent levels of transit coverage within the downtown area. Between the build alternatives, the station locations vary by only a block, at most. The At-Grade Emphasis LRT Alternative would incur a longer trip time than the Underground Emphasis LRT Alternative, but the connectivity and the potential for single-vehicle service from Pasadena, Long Beach, East Los Angeles, and Culver City would be the same. It is important to note that downtown Los Angeles is already heavily served by transit, and the Regional Connector's primary

purpose is to improve the connection between the light rail lines in the area and reduce the need for transfers, not necessarily to provide access to areas previously un-served by the transit system. In any event, the density of transit service would be increased in the areas around the stations, and this would bring added development, jobs, and mobility.

4.3 Displacement and Relocation of Existing Uses

This section addresses the land ownership and leasing agreements that may change due to the project. Existing conditions and implications for displacement and relocation of existing uses within the PSA will be addressed in this section. Although the build alternatives under consideration are intended to maximize the use of publicly owned rights-of-way, certain features of these alternatives have the potential to impact persons and businesses on private property within the PSA.

4.3.1 Affected Environment

4.3.1.1 Regulatory Framework

The Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended (Uniform Act), mandates that certain relocation services and payments be made available to eligible residents, businesses, and nonprofit organizations displaced as a direct result of projects undertaken by a federal agency or with federal financial assistance. The Uniform Act provides for uniform and equitable treatment of persons displaced from their homes and businesses and establishes uniform and equitable land acquisition policies.

Owners of private property have federal constitutional guarantees that their property will not be taken or damaged for public use unless they first receive just compensation. Just compensation is measured by the "fair market value" of the property taken, where "fair market value" is considered to be the:

> "highest price on the date of valuation that would be agreed to by a seller, being willing to sell, but under no particular or urgent necessity for so doing, nor obliged to sell; and a buyer, being ready, willing and able to buy but under no particular necessity for so doing, each dealing with the other with the full knowledge of all the uses and purposed for which the property is reasonably adaptable and available." (Code of Civil Procedure Section 1263.320a)

The provisions of the California Relocation Act (California Act), applies in the absence of federal funds and/or involvement if a public entity undertakes a project and consequently must provide relocation assistance and benefits. The California Act, which is consistent with the intent and guidelines of the Uniform Act seeks to, (1) ensure the consistent and fair treatment of owners of real property, (2) encourage and expedite acquisition by agreement to avoid litigation and relieve congestion in the courts, and (3) promote confidence in the public land acquisitions. As stated above under federal regulations, owners of private property have similar State constitutional guarantees regarding property takes, damages, and just compensation.

4.3.1.2 Existing Conditions

Section 4.2 describes the existing land uses within the PSA. In addition, Section 4.4, Community and Neighborhood Impacts, describes the neighborhoods within the PSA.

4.3.2 Evaluation Methodology

Table 4-1 shows typical sources and causes of land acquisition and displacement that could potentially occur with the PSA. When an acquisition occurs, it typically results in either a full or partial take of a parcel. A partial taking would occur if the project did not require the acquisition of the entire parcel, but just enough of the parcel to accommodate the proposed project. This would occur if, for example, a portion of a commercial parking lot fronting the alignment is required, but not the adjacent commercial building located away from the alignment. Partial takings may result from the widening of a street or intersections due to inadequate right-of-way widths, limited cross-sections, and vertical circulation needs adjacent to subway stations. The widening of intersections are often required for the addition of left-turn lanes that have been relocated due to the installation of at-grade station platforms within the street median, adjacent to the transit tracks. Street widening may be necessary when the existing horizontal alignment contains insufficient right-of-way. Vertical circulation is needed near underground stations as additional land is needed to bring passengers to the surface.

Table 4-1 Sources and Causes of Displacement

Source	Type of Acquisition	Cause/Process
Horizontal alignment	Full/Partial	Not enough right-of-way for alignment
Vertical circulation above subway station	Partial	Additional area needed adjacent to subway station to bring passengers to surface
Street widening	Partial	Aerial structures requiring columns
Illegal encroachment	Full	Unauthorized use of private property
Access to a businesses (driveway or road)	Full	Damages resulting from reduced or restricted access
Storage Yards	Full	Additional area required to perform maintenance
Widening of intersections	Partial	Additional area to maintain traffic volumes, turn lanes, or platforms
Tunneling easement	Easement	Subway travels off public right-of-way

Source: Terry A. Hayes & Associates, 2008

A full taking would occur under two circumstances: (1) when the majority of the property is required for the horizontal alignment because of insufficient public right-of-way or the need to construct storage or maintenance facilities, and (2) when the damage caused to the property (e.g., driveway access to a property is eliminated or reduced due to the construction of transit that travels down the side of a street, as opposed to the median) is so great that the owner is deprived of all beneficial use. Damages to a property would typically result from restricted access or demolition of improvements.

Metro would need to obtain easements instead of acquiring or displacing the uses on those parcels under which the underground segments would travel.

The analysis below assesses the potential need for acquisition along each alignment.

4.3.3 Environmental Issues

The project would typically use existing rights-of-way when developing the proposed alternatives. However, where the proposed alignments transition from underground to at-grade, as well as at stations, there is the potential to displace properties. Although the Underground Alternative avoids most surface conflicts, property acquisition may be needed for portals and station entrances. Acquisitions for station entrances could occur at underground stations for each alternative. Other potential displacement includes the following:

At-Grade Emphasis LRT Alternative

- Potential right-of-way acquisitions may be necessary at Flower and 3rd Streets. (Option A) or Flower and 5th Streets (Option B) for the tracks to transition from underground to at-grade. Additionally, there are potential right-of-way acquisitions on 2nd St. According to preliminary station and alignment design the stations will need an area approximately five feet deep along the street frontage for the length of the station for construction.

- Potential for parking displacement exists along 2nd, Main, Los Angeles and Temple Streets associated with the At-Grade Emphasis LRT Alternative.

Underground Emphasis LRT Alternative

- Potential acquisition of the entire block bounded by Central Ave., Alameda St., 1st St., and 2nd St. may be necessary for the portal to transition from underground to at-grade to connect to Metro's Gold Line Extension. There are no residences in this block, but it is across the street from the Japanese American National Museum and from residences on Alameda St. Although no displacement is anticipated on the east side of Alameda St. (Arts District), removal of commercial businesses could indirectly impact the residents in the area.

- Parking displacement along areas adjacent to the portal at Little Tokyo may potentially impact businesses and residents of Little Tokyo and the Arts Districts, as well as visitors to the museums, shops, and restaurants located in Little Tokyo.

- As identified in the Initial Screening Report, given the need for acquisitions for underground station entrances, the Underground Emphasis LRT Alternative would require a greater amount of property acquisition than the At-Grade Emphasis LRT Alternative.

- Any potential acquisition or displacement as a result of the project would occur in compliance with the Uniform Act and/or California Act, as applicable.

4.4 Community and Neighborhood Impacts

This section discusses the effects of the build alternatives on the neighborhoods within the PSA. Particular attention is paid to demographic characteristics, community division, and mobility.

4.4.1 Affected Environment

As mentioned earlier, the PSA is an extremely built out area with unique neighborhood characteristics among all the districts. Although the PSA is composed of the central core of downtown, the area of influence includes surrounding communities and the region as a whole, which will benefit from the Regional Connector. Also, the recent resurgence and development, such as the Arts District and the LA Live Development, greatly influence and affect the patterns of development and the characteristics that are introduced into these neighborhoods.

In the same way, the Regional Connector will introduce new elements, not only of physical design, but of mobility and travel characteristics and patterns that may affect the way people interact in these spaces. The proceeding sections provide a detailed description of the districts which make up the Regional Connector PSA as well as the current travel and housing characteristics in each.

4.4.1.1 Existing Conditions

Community and Neighborhoods

The following neighborhoods comprise the PSA:

Bunker Hill

The Bunker Hill District is located generally between 1st St. on the north, Hill St. on the east, 3rd St. on the south, and Figueroa St. on the west. Major downtown destinations located within Bunker Hill include the Walt Disney Concert Hall, Museum of Contemporary Art (MOCA), several high-rise office towers, senior and market rate housing, hotels, and commercial/retail centers. Bunker Hill has over 3,200 residential units, mainly in mid- and high-rise buildings. Large development projects planned for this area include Civic Park and the Grand Avenue Development Project, which will transform this area into a regional arts, entertainment, and residential destination. The Grand Avenue Development is a $3 billion project that includes 3.6 million square feet of development with 449,000 square feet of retail. It is currently planned for 2,600 housing units, almost doubling the existing number of units in the area.

Civic Center

Bordering Bunker Hill to the northeast is Civic Center, which serves as a hub for city, county, state, and federal government offices and services, with the second largest concentration of civic buildings in the country. The Cathedral of Our Lady of the Angels, completed in 2002, the Ahmanson Theater, Mark Taper Forum, and the Dorothy Chandler Pavilion are other major destinations in this district. Civic Center is undergoing active redevelopment as the new headquarters for the state Department of Transportation

(Caltrans) District 7 has recently been completed, development of the new Los Angeles Police Department Headquarters is underway, and construction of a U.S. Federal Courthouse is soon to begin.

Little Tokyo

East of Civic Center is Little Tokyo, which is the center of the largest Japanese-American community in the continental United States. The Japanese American National Museum and Geffen Museum of Contemporary Art are located here, along with a lively shopping district. There is active residential development underway within Little Tokyo, with recently completed and current projects adding more than 2,000 residential units. Significant developments in the early planning stages include a 4.5-acre site adjacent to the Gold Line's future Little Tokyo Arts District Station. Early concepts from developers identified high-density combination of office and housing with a strong connection to the Metro Gold Line.

Toy District

The Toy District is a 12-block shopping area with over 500 retail businesses located south of Little Tokyo and north of Central City East. Development here is primarily comprised of mixed-use projects. The proposed Medallion project will provide 192 residential lofts and over 200,000 square feet of retail space.

Financial Core

The Financial Core District is located south of Bunker Hill and is dominated by high-rise office buildings. The Central Library is located here, and has been recently restored and expanded. Other landmarks in this district include the Millennium Biltmore Hotel and Pershing Square. The proposed 2.7 million square foot Metropolis mixed-use development is located in the southwestern end of the Financial District. Phase I of this project, scheduled to begin construction in 2008, will provide 360 residential units. Park Fifth is another major planned 76-story high-rise development across from Pershing Square and will include over 700 condominiums and a 200 room hotel.

Historic Core

To the east of the Financial Core is the Historic Core District, containing a large concentration of historic and architecturally significant buildings, including the Bradbury Building. The Grand Central Market and the Broadway Historic Theater District are destinations in this district. Development here is focused on conversion of old neglected buildings into lofts and apartments.

Jewelry District

The largest Jewelry District in the U.S. and second largest in the world is located southwest of the Historic Core, comprised of 5,000 businesses with billions of dollars in revenue. Development in this area includes the proposed construction of 875 condominium units at 8th and Grand Streets.

Central City East

Central City East is located south of the Toy District and consists primarily of commercial uses, including wholesale buildings and warehouses. The Flower Market, produce, fish and food processing industries, and import/export businesses employ nearly 20,000 people in this area. Housing in this district consists mainly of the 6,500 single room occupancy hotel units. This area also has social services, including alcohol treatment, mental health services, and job training.

4.4.1.2 Transit-Relevant Demographic Characteristics

The PSA makes up 1.6 square miles, or 0.03 percent of the 4,752 square miles of Los Angeles County. As shown in Table 4-2, in 2005, the total population of the PSA was 17,795, which comprised 0.18 percent of the total Los Angeles County population of over ten million. Despite its small size, the PSA sustained 3.62 percent of the County's employment, or 168,328 jobs, in 2005. The average population density within the PSA was 11,685 people per square mile, significantly higher than the 2,107 people per square mile population density found in Los Angeles County in 2005. Employment density in the PSA was 110,529 employees per square mile, which was also significantly higher than the county's overall employment density of 977 employees per square mile.

Table 4-2 Population and Employment in the Project Study Area

Demographics	PSA	L.A. County	Percent of County
Population	17,795	10,010,315	0.18
Population Density	11,685	2107	NA
Total Employment	168,328	4,644,010	3.62
Employment Density	110,529	977	NA

Source: Southern California Association of Governments (SCAG), 2005

Residences in the area have been categorized as single-family homes, multi-family homes, or group quarter residences, which include military barracks, dormitories, and institutional housing. Data for the number of low, medium, and high-income households in the PSA were available for single-family and multi-family residences only, of which there were 9,673 households in 2005 with a median household income of approximately $45,000. Group quarters added an additional 5,466 residences. As shown in Table 4-3, based on these 2005 data, the PSA is primarily composed of low-income households, with a moderate medium-income household population. As mentioned above, recent development of the PSA continue to bring about demographic changes that may not be reflected in data from 2005.

Table 4-3 Income Status within the Project Study Area		
Demographics	PSA	Percent of PSA
Total Residences	15,136	N/A
Total Households	9,673	100
Low Income Households	7,244	75
Medium Income Households	2,009	21
High Income Households	417	4

Source: SCAG, 2005

In 2005, only 5.5 percent of the young people in Los Angeles County lived within the PSA. Comparatively, 29.4 percent of the population of Los Angeles County in 2005 was age 18 and under. As downtown resurgence attracts those seeking an urban lifestyle, a rise in the number of young people living downtown will likely occur.

As shown in Table 4-4, the PSA also demonstrates a higher percentage of elderly residents (19.7 percent) when compared to Los Angeles County (9.7 percent). The young and the elderly have a higher propensity for using public transportation since these groups are less likely to have drivers' licenses or access to private automobiles. The Regional Connector is expected to improve transit connectivity and accessibility for members of these groups living outside the PSA who would wish to commute into it.

Table 4-4 Population Age				
AGE	PSA	Percent	L.A. County	Percent
18 and under	976	5.5	2,798,604	29.4
65 and over	3,497	19.7	926,670	9.7

Many of the households in the PSA, approximately 69 percent, have no car and rely on public transit for commuting needs. Additionally, there is a high volume of transit ridership in the PSA, including 23 percent of employed residents age 16 and over, as well as a large number of commuters from outside the PSA who utilize transit to get to employment and other opportunities within the project study area. When comparing vehicle accessibility and public ridership patterns in the PSA, the trends suggest that even households in the PSA with one or more cars have a higher propensity to use public transportation than similar households elsewhere in Los Angeles County.

Table 4-5 presents demographic information for the PSA as compared to the County as a whole.

Table 4-5 Transit Dependent Demographic Information			
	PSA	LA County	PSA % of LA County
Population	17,795	10,010,315	0.18
Under 18 years	976	2,798,604	0.03
Over 65 years	3,497	926,670	0.38
Households	9673	3,298,210	0.29
No vehicle households	8,586	671,214	1.28
Use public transportation	1,025	254,091	0.40
Low income households	7,244	1,481,896	0.49
Total employment	168,328	4,644,010	3.62

Source: SCAG, 2005 data and 2030 projections

4.4.2 Evaluation Methodology

The following analysis considers the potential impacts of the project on demographic characteristics, community division, and mobility within the PSA to assess whether the Project would disrupt, divide, or isolate existing communities or land uses.

4.4.3 Environment Issues

Depending on which alternative is selected, the neighborhoods within the PSA will incur varying levels of potential environmental impacts, particularly along the streets under consideration for rail alignments. Because both alternatives follow similar routes, their impact on transit ridership, employment, residential population, and mobility would be nearly identical.

As discussed in detail in Section 4.16, Construction Impacts, temporary impacts are primarily associated with the construction of the at-grade alignment and underground and at-grade stations, which would last for approximately three to four years. These temporary impacts include significant noise and vibration during business hours, dust, and traffic congestion due to closed streets and the movement of construction vehicles. However, some of these impacts may be less intrusive downtown as they might be in other parts of the City, since there is already a high level of activity and traffic noise throughout the PSA. Also, the temporary environmental impacts would be similar for both the at-grade and the underground alignments, since both would require heavy construction activity.

The impacts of the operation of the project will vary based on whether the at-grade or underground alignment is chosen. The At-Grade Emphasis LRT Alternative involves placing tracks in either the center lanes of the street or the curb lanes, as well as erecting 25-foot tall catenary poles above the street level and placing traction power substations every mile alongside the tracks. High-platform stations with canopies would be located in the roadway medians or curb lanes, and would stretch across the majority of the city block. As such, there would be a visual change to the neighborhoods through which the tracks pass, as well as potential mobility impacts for pedestrians who may lose the ability to use existing crosswalks. Given the placement of tracks along 2nd, Main, and Los Angeles Streets outlined for the At-Grade Emphasis LRT Alternative, it is conceivable that pedestrian mobility from the Civic Center to Little Tokyo and the Historic Core could be

reduced. Also, removing traffic lanes from these streets may also add to auto congestion and bus trip times. Current operating hours for the Metro Rail system are 4 a.m. to 1 a.m. daily, and it is expected that trains will generate noise (bells, horns, public address announcements, and rail squealing) along the project right-of-way during these hours.

The Underground Emphasis LRT Alternative on the other hand, is entirely underground except for a short portion of the tracks, just southwest of the Metros Gold Line's Little Tokyo station at 1st and Alameda Streets. As such, there will be no prominent surface impacts, aside from station portals along the sidewalks or in plazas adjacent to the street. The operational noises discussed above may still emanate from the ventilation shafts embedded in the roadway or sidewalk as well as the portal at 1st and Alameda Streets, but the levels would be minor compared to an at-grade alignment. Overall, the Underground Emphasis LRT Alternative would cause little change in community division and pedestrian mobility within the neighborhood.

4.5 Visual and Aesthetic Impacts

Transportation infrastructure has the potential to enhance pedestrian activity, create pedestrian-friendly environments, enliven streetscape through architecture, signage, lighting, and landscaping and help in the support for revitalizing areas in need of rejuvenation. However, transportation infrastructure also has the potential to negatively alter the visual landscape when a proposed project is out of scale with its immediate surroundings, and results in development of unwanted infrastructure such as overhead wires or structures that may detract from the visual setting or block views of existing scenic vistas, historical structures, or other visual resources.

4.5.1 Affected Environment

4.5.1.1 Regulatory Framework

As discussed in Section 4.2.1.1, the PSA is within the Central City Community Plan of the General Plan's Land Use Element. The Central Community Plan includes an Urban Design chapter that contains objectives and policies support the development and re-enforcement of a pedestrian-friendly environment and streetscape.

4.5.1.2 Existing Conditions

The alternative alignments are located in a highly urbanized setting surrounded by a variety of land uses. The primary visual features in the area are historical buildings, contemporary buildings with notable architecture, and street trees. The street characteristics of the PSA, although concentrated in the dense downtown setting, differ from district to district, from the modern high rise architecture of the financial district to the Art Deco City Hall and the period characteristics of the historic core.

The following section summarizes the characteristics of both alignments and their potential impacts on surrounding environments.

4.5.1.3 Potential Impacts

The development of the At-Grade Emphasis LRT Alternative or the Underground Emphasis LRT Alternative has the potential to affect the immediate surroundings by adding new features to the visual landscape, including the introduction of catenary poles and wires, at-grade track, station platforms, and/or off-street portals leading to underground stations. Roadway modifications to accommodate at-grade track would also change the existing visual landscape.

Aboveground stations and portals to underground stations would also introduce a new source of nighttime lighting.

At-Grade Emphasis LRT Alternative

The At-Grade Emphasis LRT Alternative would run mostly at the same elevation as the surrounding road network and would include tracks located in a dedicated right-of-way or an arterial street median, with catenary wires located above the tracks. Catenary poles would be approximately 25-feet tall above the street level, and traction power substations would be located every mile along the tracks. With the At-Grade Emphasis LRT Alternative Option A, approximately 64 percent of the alignment would operate at-grade and the remaining 34 percent would be underground. With Option B, approximately 79 percent of the alignment would operate at-grade, with the remaining 21 percent located underground.

The At-Grade Emphasis LRT Alternative is located within one-quarter mile of two National Historic Landmarks, five National Register Districts, 75 individual National Register properties/resources, 98 California Register designations, and 37 local landmarks. The total number of potentially impacted notable architectural resources is 217. Of these resources, the greatest potential visual impacts would be on the resources located adjacent to an alignment and in the vicinity of the stations.

The Initial Screening Report describes Option A as being located within one-quarter mile of 13 buildings with notable architecture, and Option B as being located within one-quarter mile of 11 buildings with notable architecture. Of these sites, 11 are located directly adjacent to both of the At-Grade Emphasis LRT Alternative alignment options. The 11 sites are listed below and the relationship to the alignment is briefly described. Any differences between Option A and Option B are noted. For additional information on historical resources, see Section 4.12, Historic, Archeological, and Paleontological Resources.

- Edward R. Roybal Federal Building - located northeast corner of the Temple St. and Los Angeles St. intersection. The alignment would be at-grade to the south of the site along Temple St.
- Fletcher Bowron Square – Los Angeles Mall - located in the 300 block of Main St. between Temple St. and Aiso St. The alignment would be at-grade to the south of the site along Temple St.

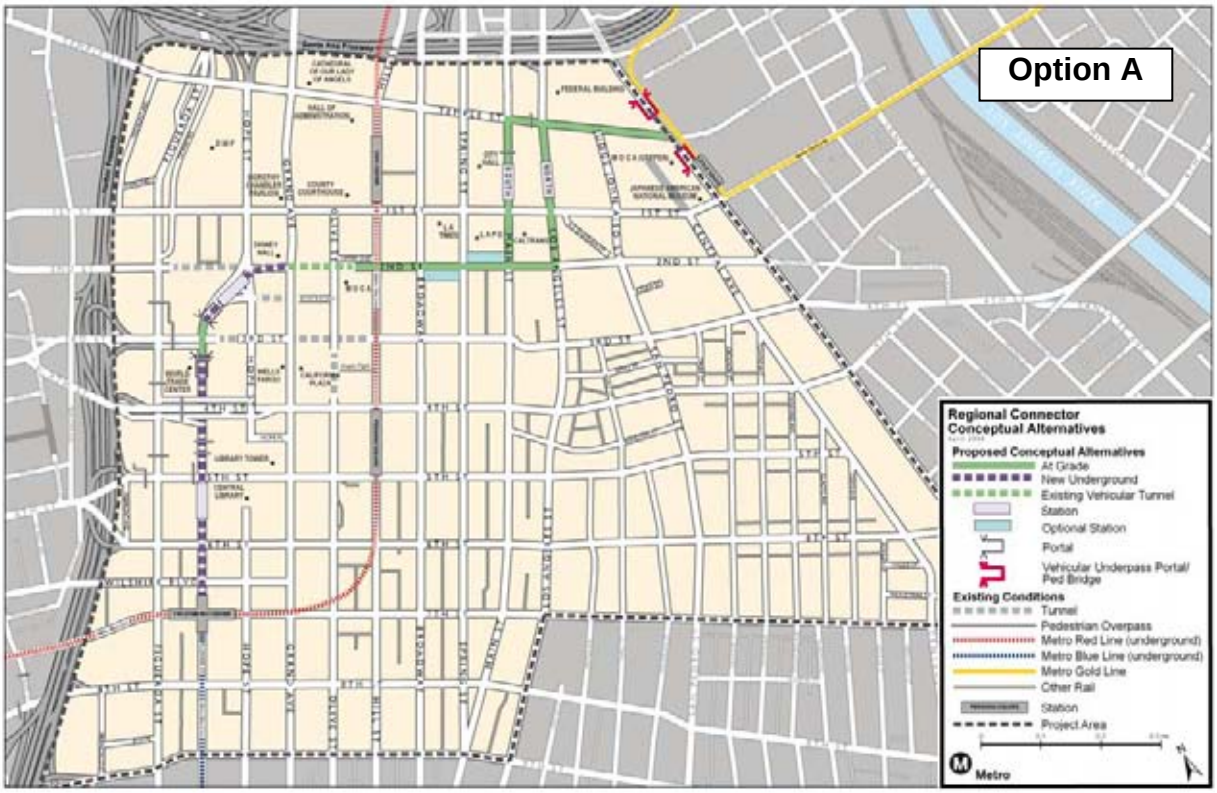

Figure 4-2 At-Grade Emphasis LRT Alternative

- Caltrans Building - located at the north side of 2nd St. between Main St. and Los Angeles St. The alignment would be at grade to the east, west, and south of the site.

- Los Angeles Civic Center - generally located north of 1st St. and south of Aiso St. or Temple St. between Figueroa St. and Alameda St. The alignment would run at-grade through the Civic Center on Main St., Los Angeles St., and Temple St. east of Main St.

- Los Angeles City Hall – located at northwest corner of 1st St. and Main St., within the Los Angeles Civic Center. The alignment would run at-grade to the east of City Hall on Main St.

- Higgins Building – located at the southwest corner of the 2nd St. and Main St. intersection. The alignment would be at-grade to the north of the site along 2nd St. The optional eastbound Spring St. Station platform would be on the north side of 2nd St., opposite the site.

- (Former) Saint Vibiana's Cathedral – located on Main St. south of 2nd St. The alignment would be at-grade to the north of the site along 2nd St. The optional eastbound Spring St. station platform would be on the north side of 2nd St. to the west of the site.

- Disney Concert Hall – located on 2nd St. between Grand Ave. and Hope St. The alignment would be below-grade to the south of the site, and would transition to at-grade at Grand Ave. to the east. A station would be located to the southwest.

- Westin Bonaventure Hotel – located on Flower St. between 4th St. and 5th St. The alignment would run below-grade (Option A) or would transition from at-grade to below-grade (Option B) to the east of the site on Flower St. A below-ground station would be located to the south (Option A) or an aboveground station would be located to the north (Option B) along Flower St.

- Los Angeles Central Library Building and Grounds – located on 5th St. to the east of Flower St. The alignment would run below-grade to the west of the site on Flower St. A station would be located to the west of the library site (Option A).

- California Club Building – located on Flower St. north of 6th St. The alignment runs below-grade to the west of the site on Flower St. A station is located to the north along Flower St. (Option A only).

- Additionally, there are numerous outdoor public works of art, such as sculptures, murals, and fountains, associated with development located along the alignments such as the Civic Center, Central Library, Fletcher Brown Square, and museums. Some of the art works are visible from the adjacent streets and sidewalks.

With the At-Grade Emphasis LRT Alternative, roadway modifications would be necessary to accommodate the at-grade track, including the reduction of lane widths, altering of existing lane configurations, and removal or displacement of left-turn pocket lanes. As Option B has a greater percentage of at-grade service versus underground service, it would require a greater number of roadway modifications.

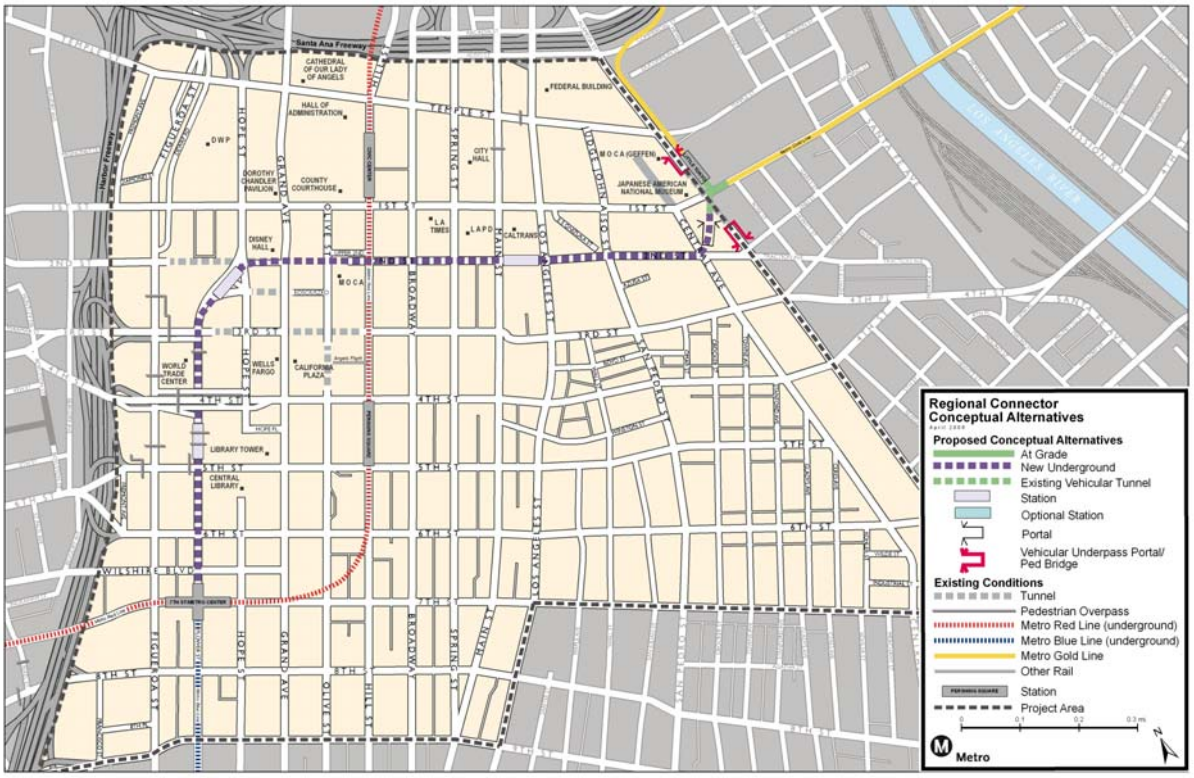

Figure 4-3 Underground Emphasis LRT Alternative

Underground Emphasis LRT Alternative

The Underground Emphasis LRT Alternative is primarily underground (approximately 91 percent) with a small portion operating at-grade (9 percent). Therefore, along most of the alignment, trains and track would not be visible. Furthermore, given the limited portion of track located at-grade, roadway modifications would be minimal. The Underground Emphasis LRT Alternative has three underground stations, all of which would have at-grade portals.

The Underground Emphasis LRT Alternative would be within one-quarter mile of two National Historic Landmarks, four National Register Districts, 78 individual National Register properties/resources, 88 California Register designations, and 31 local landmarks. The total number of notable architectural resources is 203.

The Underground Emphasis LRT Alternative would be located within one-quarter mile of nine buildings with notable architecture. Ten sites with notable architecture are located adjacent to the alignment. The sites are listed below and the relationship to the alignment is briefly described. Unless noted, the alignment is below-ground. For additional information on historical resources, see Section 4.12, Historic, Archeological, and Paleontological Resources.

Japanese American National Museum – located at the northwest corner of 1st and Alameda Streets. The alignment transitions from below-ground to above-ground south of the site and connects to the proposed Little Tokyo/Arts District Station to the east (transfer station to the Gold Line) and proposed maintenance and operations facility. The proposed station would require existing Alameda St. to be constructed below-grade under the Alameda St. and 1st St. intersection where an LRT junction and pedestrian bridges are proposed to be built.

- Little Tokyo Historic District – generally located north of 2nd St. between San Pedro St. and South Central Ave. The alignment would run to the south of the District.
- The Geffen Contemporary at MOCA - located on Alameda St. north of the Japanese American Museum on 1st St. The alignment would end at the proposed Little Tokyo/Arts District Station and maintenance and operations facility on Alameda Ave., to the east of the site. The station and alignment would be at-grade.
- Caltrans Building - located at the north side of 2nd St. between Main and Los Angeles Streets. At least one portal would be located adjacent to the Caltrans building along 2nd St.
- Higgins Building – located at the southwest corner of the 2nd St. and Main St. intersection. The alignment would be to the north of the site along 2nd St. A station would be located to the west of the site.
- (Former) Saint Vibiana's Cathedral – located on Main St. south of 2nd St. The alignment and station would be located to the north of the site along 2nd St. One possible portal location would be on the Saint Vibiana site.
- Disney Concert Hall – located on 2nd St. between Grand Ave. and Hope St. The alignment would be south of the site on 2nd St. A station would be located to the southwest.
- Westin Bonaventure Hotel – located on Flower St. between 4th and 5th Streets. The alignment and a station would be located to the east of the site. An at-grade portal may be located on or near the Westin Bonaventure Hotel site.
- Los Angeles Central Library Building and Grounds – located on 5th St. to the east of Flower St. The alignment would be to the west of the site on Flower St. A station would be located to the north of the library site.

- California Club Building – located on Flower St. north of 6th St. The alignment is to the west of the site on Flower St.

4.5.2 Evaluation Methodology

The evaluation of potential aesthetic impacts involves determining if changes would occur to the aesthetic character of the area surrounding the alignments. This entails reviewing the above-ground infrastructure associated with each alternative and analyzing if it would affect the overall character of the area and result in the obstruction of views or removal of any visual resources along the alignment, and to what degree. Obstruction of important views or introduction of elements inconsistent with the existing visual character would result in visual impacts.

To determine the notable architectural resources within one-quarter mile of each alignment, information was gathered from the City of Los Angeles, Department of City Planning's Historic-Cultural Monument Report for the Central City Community Plan Area, Metro's Angels Walk L.A. Program (a walking trail that links Los Angeles' landmarks with transit), the Los Angeles Convention Center's list of landmarks to visit while in Los Angeles, and a field survey conducted on February 1, 2008.

4.5.3 Environmental Issues

Both alignments would involve some changes to the existing visual landscape; however, the degree to which this would occur varies between the alternatives. Notably, the at-grade alignment has a greater potential for visual impacts as it involves substantially more above-ground infrastructure than the underground alternative. However, given that the existing setting is highly urbanized, the introduction of new infrastructure and roadway modifications associated with any of the alternative would not be out of character with the existing setting. Therefore, substantial degradation of the existing visual quality or impairment of the quality of the pedestrian environment is anticipated. Further, none of the alternatives would result in removal of notable architectural resources. However, potential impacts related to visual resources could involve impeding line of sight of notable architectural resources and removal of street trees. These potential impacts are discussed further below as related to the specific alternatives.

At-Grade Emphasis LRT Alternative

The At-Grade Emphasis LRT Alternative has the potential to impact views through the introduction of new aboveground infrastructure such as train track, catenary wires and poles, and station platforms. Station portals and associated signage would be required for underground stations along the alignment. Catenary poles for the proposed project may in some cases replace existing utility poles. However, given catenary wires and support requirements, the wires and poles could increase visual clutter, particularly at curves and corners. Thus, the catenary wires and poles may obstruct views of notable architectural resources, as well as modifying the visual character of the area.

The At-Grade Emphasis LRT Alternative would also require substantial roadway modifications to accommodate the track and related infrastructure associated with the at-grade segments of the alignment. While roadway modifications and construction would result in visual disruption during the construction period, this new infrastructure would be consistent in character with the existing urban setting.

Views of the individual architectural resources listed in Section 4.5.1 may be interrupted by station platforms, portals to underground stations, and catenary wires and poles. However, the wires, portals, and platforms would not fully impede views. Views may be completely blocked when a train is stopped at a platform when located between an on-looker and the notable structure, but this would occur on a temporary basis. Once a train had departed a station, limited views of the structure would be available. The new infrastructure would be consistent with the overall urban streetscape along the alignments. While it would partially block some views of notable architecture when the infrastructure is between the viewer and the visual resource, views would only be fully impeded temporarily at select locations near station platforms.

Views of public art work from streets and sidewalks on opposite sides of the street could potentially be obscured by at-grade infrastructure associated with the alternative. It is anticipated that public art work would still be accessible for viewing from the sidewalks immediately adjacent to the art work and from within the public sites. However, potential visual obstruction of notable public artwork would require further evaluation.

The At-Grade Emphasis LRT Alternative calls for the construction of an automobile underpass and a pedestrian overpass at the intersection of Temple and Alameda Streets. The pedestrian overpass in particular would impose some visual impacts for onlookers in all directions, though these effects would be limited due to the visual impacts of the existing Metro Gold Line Eastside Extension overpass located immediately northeast of the intersection. Also, pedestrians using the overpass would have a new vantage point for viewing the Little Tokyo and Civic Center areas.

The At-Grade Emphasis LRT Alternative could result in the loss of existing street trees. Mitigation or adoption of project design features to preserve or replace street trees as feasible may be required to ensure that this is not a significant visual impact.

At-grade stations could incorporate urban design elements consistent with surrounding structures and become destination points integrated into the surrounding urban streetscape. The stations would thereby contribute to a pedestrian-friendly environment.

Given the amount of existing lighting sources within the PSA, new lighting associated with the proposed alternatives is not anticipated to result in a noticeable change in the overall lighting levels.

Of the two At-Grade Emphasis LRT Alternative options, a larger percentage of the Option B is located above-ground (79 percent) than Option A (64 percent), and therefore Option B has a greater potential for visual impacts.

Underground Emphasis LRT Alternative

Although the Underground Emphasis LRT Alternative is almost entirely underground, it would have portals and signage directing transit riders to underground stations that would be visible above-ground, and thereby cause some alteration of the existing streetscape. Portals to underground stations would typically be located either on the sidewalk or pedestrian plaza, where passengers enter the station via escalators, elevators, or stairs away from at-grade views. Compared with at-grade stations, portals leading to underground stations would be less visually intrusive and may actually improve the streetscape through the use of lighting, landscaping, plazas, kiosks, public art, and other elements. Further, while portals would alter the existing views, they would be consistent with the urban character of the surroundings and would not be of sufficient size and height to fully block views of the surrounding architecture. Therefore, potential effects on notable architecture are anticipated to be minimal. However, specific portal locations near buildings with notable architecture (i.e., former Saint Vibiana's Cathedral and Caltrans buildings) would need to be further evaluated. In addition, evaluation would also be required to determine if any of the portals would obscure views of notable public art work from streets or sidewalks.

The Underground Emphasis LRT Alternative also calls for an automobile underpass and pedestrian overpass at the intersection of 1st and Alameda Streets. Pedestrians using the overpass would have a new, elevated structure from which to view the Little Tokyo area, but the line of sight between the 1st St. bridge and the historic Little Tokyo retail strip on East 1st St. would be obstructed.

Construction of an underground alignment could have a potentially greater visual impact than at-grade construction due to the longevity of construction and work necessary to create underground tunnels. However, visual disturbance resulting from construction activities would be temporary.

Therefore, while temporary construction impacts may be more visually disruptive under the Underground Emphasis LRT Alternative, the operational impacts would be substantially less with the Underground Emphasis LRT Alternative versus the At-Grade Emphasis LRT Alternative. The Underground Emphasis LRT Alternative entails substantially less aboveground infrastructure, thereby resulting in fewer alterations to the existing visual setting.

4.6 Air Quality Impacts

In response to concerns about air pollution, Federal, State, and local authorities have adopted various rules and regulations requiring evaluation of air quality impacts of projects and appropriate mitigation for air pollutant emissions. The following discussion focuses on ambient air quality standards, the existing setting of the PSA, and potential impacts.

4.6.1 Affected Environment

4.6.1.1 Regulatory Framework

Federal Clean Air Act: Air quality in the United States is governed by the Federal Clean Air Act (CAA) and is administered by the U.S. Environmental Protection Agency (EPA). Under the authority granted by the CAA, EPA has established national ambient air quality standards (NAAQS) for the following criteria pollutants: carbon monoxide (CO), lead (Pb), nitrogen dioxide (NO_2), ozone (O_3), particulate matter (PM_{10} and $PM_{2.5}$), and sulfur dioxide (SO_2). Table 4-6 presents the NAAQS that are currently in effect for criteria air pollutants. O_3 is a secondary pollutant, meaning that it is formed from reactions of "precursor" compounds under certain conditions. The primary precursor compounds that can lead to the formation of O_3 include volatile organic compounds (VOC) and oxides of nitrogen (NO_x).

Table 4-6 South Coast Air Basin Attainment Status /a/

Pollutant	National Standards	California Standards
Ozone (O3)	Non-attainment – Severe 17	Non-attainment
Carbon monoxide (CO)	Attainment – Maintenance /b/	Non-attainment – Transitional /c/
Nitrogen dioxide (NO2)	Attainment – Maintenance	Attainment
Sulfur dioxide (SO2)	Attainment	Attainment
Respirable particulate matter (PM10)	Non-attainment – Serious	Non-attainment
Fine particulate matter (PM2.5)	Non-attainment	Non-attainment
Lead (Pb)	Attainment	Attainment

/a/ Status as of June 15, 2007.
/b/ The EPA redesignated the SCAB as attainment for the CO NAAQS in 2007 (72 FR 26718).
/c/ The Los Angeles County portion of the SCAB was redesignated by CARB as attainment for the CO CAAQS, awaiting final State administrative process to officially change designation.
Source: CDM 2007

The CAA also specifies future dates for achieving compliance with the NAAQS and mandates that states submit and implement a State Implementation Plan (SIP) for local areas not meeting these standards. These plans must include pollution control measures that demonstrate how the standards will be met.

The City of Los Angles is included in the South Coast Air Basin (SCAB), which is designated as a federal non-attainment area for O3, PM10, and PM2.5.

California Clean Air Act: In addition to being subject to the requirements of the Federal CAA, air quality in California is also governed by the more stringent regulations under the California CAA. The California CAA is administered statewide by the California Air Resources Board (CARB). CARB oversees the functions of local air pollution control districts and air quality management districts, who in turn administer air quality activities at the regional, or air district, level. The California Clean Air Act (CCAA), signed into law in 1988, requires all areas of the State to achieve and maintain the California Ambient Air Quality Standards (CAAQS) by the earliest practical date. The CAAQS are at least as stringent, and often more stringent than the NAAQS. The currently applicable CAAQS are presented with the NAAQS in Table 4-6 for each pollutant.

CARB has been granted jurisdiction over several air pollutant emission sources that operate in the State. Specifically, CARB has the authority to develop emission standards for on-road motor vehicles, as well as for stationary sources and some off-road mobile sources. In turn, CARB has granted authority to the regional air pollution control and air quality management districts to develop stationary source emission standards, issue air quality permits, and enforce permit conditions.

Assembly Bill 32: The California Global Warming Solutions Act of 2006, also known as Assembly Bill (AB) 32, requires CARB to adopt regulations to require the reporting and verification of statewide greenhouse gas (GHG) emissions and to monitor and enforce compliance with the program. In general, the bill requires CARB to reduce statewide GHG emissions to the equivalent of those in 1990 by 2020. CARB was required to adopt regulations for mandatory GHG emissions reporting by January 1, 2008 and to adopt a plan indicating how emission reductions will be achieved by January 1, 2009. Major rulemakings for reducing GHGs must be developed by January 1, 2011, while the rules and market mechanisms adopted by CARB do not take effect until January 1, 2012. Since CARB is still in the rulemaking process for AB 32, information about project compliance at the state-level is currently not available.

An individual project, even a very large one, does not generate enough greenhouse gas emissions on its own to significantly influence global climate change; therefore, the issue of global climate change is, by definition, a cumulative environmental impact.

Air Quality Management Plan: At the local level, the South Coast Air Quality Management District (SCAQMD) has jurisdiction over a 10,743 square mile area consisting of Orange County, the non-desert portions of Los Angeles, Riverside, and San Bernardino counties, and the Riverside County portions of the Salton Sea Air Basin and Mojave Desert Air Basin. SCAB is a sub region of the SCAQMD's jurisdiction, which covers an area of 6,745 square miles and includes all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino counties. While air quality in this area has improved, the Basin requires continued diligence to meet air quality standards.

The SCAQMD has adopted a series of Air Quality Management Plans (AQMPs) to meet the CAAQS and NAAQS. These plans require, among other emissions-reducing activities, control technology for existing sources; control programs for area sources and indirect sources; a permitting system designed to ensure no net increase in emissions from any new or modified permitted sources of emissions; transportation control measures; sufficient control strategies to achieve a five percent or more annual reduction in emissions (or 15 percent or more in a three-year period) for reactive organic compounds (ROC), NOx, CO, and PM10; and demonstration of compliance with CARB's established reporting periods for compliance with air quality goals1. On June 1, 2007, the SCAQMD adopted a comprehensive update, the 2007 AQMP for the Basin. The 2007 AQMP

[1] Reactive organic compounds (ROC) and volatile organic compounds (VOC) are designations made by CARB and USEPA, respectively, for organic compounds that react with NOx in the presence of sunlight to form O_3. Slight variations exist between the two designations; for example, the CARB definition of ROC includes ethane while the USEPA definition of VOC does not.

outlines the air pollution control measures needed to meet the federal PM2.5 standard by 2015 and the federal eight-hour ozone standard by 2024.

The SCAQMD also adopts rules to implement portions of the AQMP. Several of these rules may apply to construction or operation of the project. For example, Rule 403 requires the implementation of best available fugitive dust control measures during active operations capable of generating fugitive dust emissions from on-site earth-moving activities, construction/demolition activities, and construction equipment travel on paved and unpaved roads. In addition, Regulation XI from the SCAQMD contains source-specific standards for different operations that may be completed under the jurisdiction of the SCAQMD. Rule 1166 contains requirements related to VOC emissions from decontamination of soil. The rule sets requirements to control the emission of VOC from excavating, grading, handling, and treating VOC-contaminated soil.

4.6.1.2 Existing Conditions

Table 4-7 below provides air quality data for 2006 (the most recent available air quality data available from the SCAQMD), for the Central Los Angeles monitoring location (Station Number 087), the closest monitoring station to the proposed project site.

Table 4-7 South Coast Air Quality Management District - Air Quality Data
Central Los Angeles Station (Station Number 087) – 2006

		Maximum Concentration (ppm)	Days of AAQS Exceeded	
			Federal	State
Ozone	1-hour	0.11	0	8
	8-hour	0.079	0	4
NO2	1-hour	0.11		
	24-hour	0.06		
	Annual Average	0.0288		
SO2	1-hour	0.03		
	24-hour	0.006		
	Annual Average	0.0019		
		Maximum Concentration (ug/m3)	Days of AAQS Exceeded	
			Federal	State
PM10	24-hour	59	0	3
	Annual Average	30.3		
PM2.5	24-hour	56.2	11	
	Annual Average	15.6		

In addition to the criteria pollutants traditionally considered, GHG emissions need to be evaluated. Different from criteria pollutants, GHG considerations are not based on maintaining or achieving an ambient air quality standard, but instead focus on achieving reductions, regardless of increases in population or operations. While there are currently no specific regulatory requirements for GHG beyond mandatory reporting requirements per the guidelines developed in response to AB 32, the SCAQMD is currently in the process of developing thresholds of significance that would require all projects to provide a minimum reduction over the existing conditions. As the project is further evaluated, it will be important to estimate existing levels of GHG emissions versus the change in GHG emissions resulting from implementation of the alternatives.

4.6.2 Evaluation Methodology

This air quality evaluation is qualitative, based on experience with emissions associated with construction activities and transit systems' operational air quality emissions. A more comprehensive quantitative air quality and greenhouse gas emissions assessment will be required once additional specific analysis is performed during the EIS/EIR phase.

The subsequent analysis will evaluate the alternatives regarding criteria pollutants in accordance with SCAQMD CEQA guidelines and GHG in accordance with draft guidance as available by SCAQMD. Emissions under the current year and existing conditions will be provided as a baseline point of comparison. Criteria pollutants, specifically NOx, CO, PM2.5, and PM10, will be evaluated using SCAQMD's localized significance thresholds (LST) methodology as detailed in the Final LST Methodology document, dated June 2003. It is assumed that dispersion modeling for operational emissions will not be required as part of this evaluation, with the potential exception of localized CO impacts resulting from changes in intersection configurations and congestion resulting from any of the alternatives. If deemed necessary due to potential future decreases in level of service, localized CO impacts may be evaluated using the Cal3HQC roadway CO dispersion model.

While CEQA guidance does not currently exist detailing a methodology for estimating construction or operational GHG emissions, GHG CEQA thresholds of significance are currently being considered and drafted for the SCAQMD. Assuming a finalized, official SCAQMD methodology may not be available during this evaluation, current CARB AB 32 reporting requirements, methodologies, and emission factors will be utilized to estimate GHG emissions for all years and scenarios. Where CARB methodologies or emission factors are not available for specific sources, available EPA factors will be reviewed for use in the analysis.

4.6.3 Environmental Issues

Based on at-grade versus tunnel construction, it is anticipated that construction emissions and impacts associated with the Underground Emphasis LRT Alternative would be greater than those associated with the At-Grade Emphasis LRT Alternative. Underground construction requires excavation and disposal or reuse of greater amounts of dirt than at-grade construction. The moving of this dirt generates fugitive dust emissions as well as engine emissions from the equipment needed to dig the hole,

remove the dirt, and place it elsewhere. At-Grade construction does require moving dirt; however the quantity is significantly less.

Annual regional vehicle miles traveled (VMT) is expected to decrease under both the At-Grade Emphasis LRT and Underground Emphasis LRT Alternatives, and therefore, emissions related to vehicle exhaust (CO, CO2, and NOx) are expected to also decrease as compared to existing conditions and the No Build Alternative. As a result, none of the project alternatives are predicted to exceed operational conformity or CEQA operational thresholds.

Localized impacts, specifically localized CO concentrations at specific intersections, may occur for various alternatives due to changes in intersection configurations and levels of service (LOS). These localized impacts may result in CO hot spots. If the future traffic analysis indicates that specific intersections may suffer a decrease in the LOS, those intersections will be evaluated further for localized CO impacts in the EIS/EIR.

4.7 Noise and Vibration

This section addresses the potential impacts of the project on noise within the PSA. The analysis describes the regulatory setting and the existing setting as it relates to noise. The potential impacts that could result to surrounding land uses from noise from construction and operation of each of the components are also addressed.

4.7.1 Affected Environment

4.7.1.1 Regulatory Framework

A number of federal agencies maintain noise regulations and guidelines. These agencies include EPA, the U.S. Department of Housing and Urban Development (HUD), the Federal Highway Administration (FHWA), the Federal Aviation Administration (FAA), and the Federal Transit Administration (FTA), among others. The applicability of noise regulations depends on the nature of the agency. EPA regulations, for instance, generally apply to interstate rail, interstate commercial mobile vehicles, or to certification procedures for "low-noise emissions products." HUD noise regulations apply to HUD-assisted projects and actions, while FHWA noise regulations pertain to federally aided highway projects. Federal regulations are not applicable to the project because it does not involve interstate activities, is not assisted by HUD, and does not involve construction of highways.

The California Office of Noise Control has developed guidelines showing a range of noise standards for various land use categories. Cities within the state have incorporated these guidelines into their General Plan noise elements. These guidelines are meant to maintain acceptable noise levels in a community setting based on the type of land use. Noise compatibility by different types of land uses is a range from "Normally Acceptable" to "Clearly Unacceptable" levels. The guidelines are used by cities within the state to help determine the appropriate land uses that could be located within an existing or anticipated ambient noise level, and are primarily considered in general plans.

The project has the potential to affect noise levels within the City of Los Angeles. Noise within the City is regulated by noise ordinances, which are found in the Los Angeles Municipal Code (LAMC). These noise ordinances limit intrusive noise and establish sound measurements and criteria; minimum ambient noise levels for different land use zoning classifications; sound emission levels for specific uses (such as radio, television, vehicle repairs, and amplified equipment); hours of operation for certain activities (such as construction and trash collection); standards for determining noise deemed a disturbance of the peace; and legal remedies for violations. The noise ordinance for the City of Los Angeles can be found in Chapter XI of the LAMC. In addition, the General Plan Noise Element for the City of Los Angeles provides noise management goals, objectives, policies, and programs to achieve. The City has incorporated the California Office of Noise Control noise compatibility guidelines into their Noise Element.

4.7.1.2 Existing Conditions

Sound is defined as any pressure variation detected by the human ear. Noise is defined as any unwanted sound. The degree to which noise can affect the human environment range from levels that interfere with speech and sleep (annoyance and nuisance) to levels that cause adverse health effects (hearing loss and psychological effects). Human response to noise is subjective and can vary greatly from person to person. Factors that influence individual response include the intensity, frequency, and pattern of noise; the amount of background noise present before the intruding noise; and the nature of work or human activity that is exposed to the noise source. The preferred unit for measuring sound is the decibel (dB). The dB expresses the logarithmic ratio of the amount of energy radiating from a source in the form of an acoustic wave. The typical human ear is not equally sensitive to all frequencies of the audible sound spectrum. Sound intensity is measured in decibels that are A-weighted (dBA) to correct for the relative frequency response of the human ear. The range of human hearing extends from approximately three to 140 dBA.

The following describes the existing (baseline) environmental noise setting information presented for the At-Grade Emphasis LRT and Underground Emphasis LRT Alternatives.

The existing noise and vibration environment of an area (without the project) is generally established by the type and intensity of the existing land use and related transportation system activity. The PSA, and specifically the area of potential effect located immediately adjacent to or above the alternative alignments, is best described as an intensely developed urban core. The structure type is predominately steel and concrete high-rise buildings, attached and detached parking structures, plus a limited number of masonry low-rise multi-story buildings. There is also a small number of street-level pedestrian plazas. The land uses are office/commercial, institutional, and government plus some hotels and mixed commercial/retail with upper floor residential apartments/condominiums.

The PSA transportation network is essentially a grid pattern of street-level roads plus a few elevated ramps and below surface traffic tunnels. Both the At-Grade Emphasis LRT Alternative and the Underground Emphasis LRT Alternative are located between one and two blocks from major freeways, the I-101 (below-grade) and I-110 (western edge). Because of the characteristics of the downtown fabric and the existing buildings located in between the alignments and the freeways, very little additional noise would be expected for either alternative. One key note is the underpass element which is introduced in the Underground Emphasis LRT and the option for the At-Grade Emphasis LRT. The underpass would direct through north-south traffic on Alameda St. (the only truck-heavy street in the PSA) underground, thus minimizing traffic noise impacts even more. The estimated average ambient noise level is a Day Night Average Noise Level (Ldn) of approximately mid/upper 60's to low 70's, dBA.

The two build alternatives and proximate land use categories are shown on Figure 4-1.

4.7.2 Evaluation Methodology

This noise and vibration evaluation is qualitative, based on substantial experience with ambient and transit systems' environmental noise plus a "windshield" survey of the alternative alignments conducted during April 2008. A more comprehensive quantitative noise and vibration impact assessment will be required once additional specific analysis is performed during the EIS/EIR phase. The subsequent analysis will follow the Federal Transit Administration (FTA) guidelines contained in Transit Noise and Vibration Impact Assessment (FTA-VA-90-1003-06), issued as a Final Report May 2006.

4.7.3 Environmental Issues

Noise and vibration associated with the two build alternatives would be generated by a LRT system with associated stations and ancillary structures (e.g., discharge vent for tunnel ventilation of underground alternative). The main noise sources of the LRT vehicle are the wheel/track interface, vehicle brakes, and the propulsion system of the trainset. For stations, the primary noise sources are mechanical HVAC plus station platform paging. An additional noise source for subway systems is the tunnel ventilation system. Additional noise sources for street-level operations are grade-crossing warning bells and track horns. In general, the noise from trainsets operating at street level (with concomitantly low relative speeds compared to subway operation) would be about the same as a medium truck or a bus operating at similar speeds. The noise emission from a trainset operating in a tunnel section could be slightly louder because of a higher allowable travel speed, but the noise escaping to street level and higher, including noise from tunnel vents, would be minimal and likely inaudible compared to the existing urban ambient noise. With the exception of grade-crossing bells, noise emission from either sub-grade or street level stations would likely blend into the existing ambient noise currently generated by traffic and the myriad of high-rise buildings in the PSA. Vibration generated by the operating trainsets is expected to be low for the slower speed street-level alternatives. Vibration and resulting ground-borne noise from subway operation might be of interest in the vicinity of the Disney Concert Hall but is likely to be insignificant.

Table 4-8 Land Use Categories and Metrics for Transit Noise Impact Criteria

Land Use	Noise Metric	Description of Land Use Category
1	Outdoor Leq(h)*	Tracts of land where quiet is an essential element in their intended purpose. This category includes lands set aside for serenity and quiet, and such land uses as outdoor amphitheaters and concert pavilions, as well as National Historic Landmarks with significant outdoor use. Also included are recording studios and concert halls.
2	Outdoor dn(h)*	Residences and buildings where people normally sleep. This category includes homes, hospitals and hotels where a nighttime sensitivity to noise is assumed to be utmost importance.
3	Outdoor Leq(h)*	Institutional land uses with primarily daytime and evening use. This category includes schools, libraries, theaters, and churches where it is important to avoid interferences with such activities as speech, meditation or study associated with cemeteries, monuments, museums, campgrounds and recreational facilities can also be considered to be in this category. Certain historical sites and parks are also included.

***Leq for the noisiest hour of transit-related activity during hours of noise sensitivity.**
Source: Transit Noise and Vibration Impact Assessment (FTA-VA-90-1003-06), Chapter 3, issued as a Final Report May 2006.

At-Grade Emphasis LRT Alternative

For purposes of noise and vibration impact analysis, the potential impacts associated with Options A and B are the same. As discussed above, LRT vehicles generate more potentially audible noise when running at street level. The normal trainset noise is similar in nature and sound level to the existing street traffic traversing the area. However, "wheel squeal", train platform paging systems and any at-grade crossing bells would add noise of a different character to the existing ambient noise. When the hustle and bustle of daytime street traffic and activity subsides, the operation of a street-level LRT system could become more audible. The phenomenon of wheel squeal occurs when a steel-wheeled LRT vehicle traverses a tight-radius steel track curve and high-pitched vibration and noise emission occurs. Wheel squeal can be avoided or minimized during design by considering the radius of necessary curved track sections. This may be difficult in a densely developed urban environment. For a given track layout with tight curves, the squeal can usually be mitigated at extra expense and maintenance costs but can be a stubborn problem. Based on this, the At-Grade Emphasis LRT Alternative has a slightly higher potential for noise impacts than the Underground Emphasis LRT Alternative.

Underground Emphasis LRT Alternative

As discussed above, subway LRT noise is generally not of concern to noise-sensitive street-level land use because the noise from the train and below-grade stations/platforms is well contained within the tunnel structure and at-grade crossing bells would not be necessary. One exception is the 1st and Alameda St. intersection. This at-grade intersection may experience higher levels of noise and vibration due to the volume of trains passing through. In addition, the trains will be surfacing in a portal located in the 'Office Depot' parcel and this may affect surrounding businesses and/or residences due to vibration.

The potential noise emissions from tunnel ventilation structures is readily attenuated by application of established design principles and the common practice of locating the vent shafts such that their exits are in or adjacent to parking structures or building service areas. Because of potentially higher train speeds and closer proximity to the foundations of ground-born-noise-sensitive structures, the potential concern for these issues should be evaluated when more project details become available. In general, the Underground Emphasis LRT Alternative has a low potential for noise impacts and a slightly higher potential for vibration/ground-born noise impacts at critical receptors than the At-Grade Emphasis LRT Alternative.

4.8 Ecosystems/Biological Resources

The PSA traverses the highly developed downtown area. As such, biological resources are limited to landscaped areas where mature trees or other vegetation could support wildlife species that are adapted to the urban environment. This section discusses potential issues associated with biological resource impacts in the PSA.

4.8.1 Affected Environment

4.8.1.1 Regulatory Framework

Endangered Species Act: The Endangered Species Act and subsequent amendments provide for the conservation of endangered and threatened species and the ecosystems upon which they depend. Section 7 of the Endangered Species Act requires federal agencies to aid in the conservation of listed species, and to ensure that the activities of federal agencies will not jeopardize the continued existence of listed species or adversely modify designated critical habitat. At the federal level, the U.S. Fish and Wildlife Service and the National Oceanic and Atmospheric Administration are responsible for administration of the Endangered Species Act.

Migratory Bird Treaty Act: The Migratory Bird Treaty Act decrees that all migratory birds and their parts (including eggs, nests and feathers) are fully protected. Nearly all native North American bird species are protected by the act. Under the act, taking, killing, or possessing migratory birds is unlawful. Activities that would require such a permit would include destruction of migratory bird nesting habitat during the nesting season when eggs or young are likely to be present.

California Endangered Species Act: The California Department of Fish and Game is responsible for administration of the California Endangered Species Act. Unlike the federal Endangered Species Act, there are no state agency consultation procedures under the California Endangered Species Act. For projects that affect both a state and federal listed species, compliance with the federal Endangered Species Act will satisfy the California Endangered Species Act if the California Department of Fish and Game determines that the federal incidental take authorization is "consistent" with the California Endangered Species Act. Projects that result in a take of a state only listed species require a take permit under the California Endangered Species Act.

California Fish and Game Code Sections 3500 - 3705, Migratory Bird Protection: Sections 3500 through 3705 of the California Fish and Game Code regulate the taking of migratory birds and their nests. These codes prohibit the taking of nesting birds, their nests, eggs, or any portion thereof during the nesting season. Typically, the breeding/nesting season is from March 1 through August 30. Depending on each year's seasonal factors, the breeding season can start earlier and/or end later.

Los Angeles County General Plan: The Los Angeles County General Plan identifies Significant Ecological Areas containing biological resources and sets forth the goal of conserving these areas. While development within a Significant Ecological Area (SEA) is not prohibited, the general plan does require development to be limited and controlled in order to avoid impacting valuable biological resources.

City of Los Angeles Native Tree Protection Ordinance: The City of Los Angeles enacted an oak tree protection ordinance in 1982 to protect oak trees in the City. Although the ordinance slowed the oak tree decline, the oak population, as well as other native tree species, continued to decline. In an effort to further slow the decline of native tree habitat, the City passed an amended Native Tree Protection Ordinance (Ordinance No. 177,404), which became law on April 23, 2006. The Native Tree Protection Ordinance protects all native oak tree species (Quercus spp), California Sycamore (Platanus racemosa), California Bay (Umbellularia californica), and California Black Walnut (Juglans californica); applies to protected trees four inches or greater in diameter at 4.5 feet above ground (multiple trunk trees are calculated by cumulative diameter); applies to protected trees on private lots; and requires that a protected tree report be submitted by a registered consulting arborist, landscape architect, or pest control advisor who is also a certified arborist.

Protected tree removal requires a removal permit by the Board of Public Works. Any act that may cause the failure or death of a protected tree requires inspection by the City's Urban Forestry Division. Although the law does not require a permit for the pruning of protected trees, the City recommends consultation with a certified arborist to ensure that the pruning of protected trees is performed carefully.

4.8.1.2 Existing Conditions

Due to its densely developed and urbanized nature, the PSA provides little opportunity for wildlife species or other biological resources to exist. There are no Habitat Conservation Plans for this area, and no SEAs located within one-quarter mile of either side of the At-Grade Emphasis LRT or Underground Emphasis LRT Alternatives. There are no wildlife corridors within this area to support movement of wildlife species. There are no wetlands, oak woodlands, or coastal sage scrub habitat within the PSA. Due to the lack of habitat, sensitive species are not known to occur here. The Los Angeles River, which is contained within a concrete channel through the downtown area, is located more than one-quarter mile away from the build alternatives.

In general, biological resources within the PSA are limited to a few green spaces consisting of landscaped vegetation where highly-adaptive urban wildlife species may exist. Native plant species are mainly limited to those few that are maintained in these small green spaces. A small number of large mature trees located within the PSA may provide potential roosting and nesting sites for birds, including raptors.

4.8.2 Evaluation Methodology

To evaluate potential impacts related to the project construction and operation, the possible plant species that could occur in the PSA were reviewed, and their respective value as protected species or habitat that supports a protected species was evaluated.

4.8.3 Environmental Issues

Because of the general lack of biological resources in the PSA, as described above under Section 4.8.1.2, there are few environmental issues to consider in this regard. However, trees that may provide potential roosting and nesting sites for birds may exist within one-quarter mile of the two build alternatives. If construction of the project would require removal of these trees during nesting season, focused surveys for nesting birds would be required. Compliance with the City of Los Angeles Native Tree Ordinance would also be required. For these reasons, the Underground Emphasis LRT Alternative could be preferable to the At-Grade Emphasis LRT Alternative if it would avoid disturbance or destruction of protected trees and nesting birds. In addition, design elements would be incorporated that could add more trees and vegetation than currently exist in either alternative.

4.9 Geotechnical: Subsurface and Hazardous Materials

This section discusses potential issues associated with geology and subsurface conditions and hazardous materials within the PSA.

4.9.1 Affected Environment

4.9.1.1 Geology and Subsurface Conditions Geologic Features and Soils

The PSA is located in the northern portion of the Los Angeles Basin. This basin is a major elongated northwest-trending structural depression that has been filled with sediments up to 13,000 feet thick since middle Miocene time. On a regional scale, the PSA lies within the northernmost portion of the Peninsular Ranges geomorphic provinces near its boundary with the Transverse Ranges geomorphic provinces. The Peninsular Ranges province is characterized by elongate northwest-trending mountain ridges separated by sub-parallel, sediment-filled valleys. This province is bounded by the San Jacinto fault zone on the east, the Pacific Ocean coastline on the west, and the Transverse Ranges geomorphic province on the north. In contrast, the adjacent Transverse Ranges are characterized by east-west trending geologic structures and mountain ranges that include the Santa Ynez, San Gabriel, San Bernardino, and Santa Monica Mountains, and associated valleys. The Transverse Ranges province is a composite structural block bounded by the Big Pine fault on the north, the San Andreas fault zone on the east, the Pacific Ocean on the west, and the Malibu Coast, Santa Monica,

Hollywood, Raymond, Sierra Madre, and Cucamonga faults on the south. The regional geology in the site vicinity is shown on Figure 4-4, Regional Geology.

On a local geologic setting, the proposed alignments would traverse the southeastern end of the Elysian Park Hills and the ancient floodplain of the Los Angeles River. The Elysian Hills comprise the low-lying hills west of the Los Angeles River and southeast of the eastern end of the Santa Monica Mountains. The Hollywood fault separates the northern end of the Elysian Hills from the Santa Monica Mountains. The Elysian Hills are comprised largely of Miocene age sedimentary rocks with Pliocene age rocks flanking the southeastern edge of the hills. Previous geologic mapping identified several major geologic structures within the Elysian Hills, including the Elysian Park anticline and northwest trending faults. The proposed project located on the southwestern flank of the northwest trending Elysian Park anticline. The southerly limb of the anticlinorium contains apparent secondary folds of relatively shorter wavelength and lesser continuity of fold axes. In the vicinity of the project alignment, bedding within the Fernando and Puente formations strike approximately east-west to slightly north of east and dips moderately to steeply to the south.

The geomorphology along the proposed alignments ranges from gently sloping alluvial floodplain surfaces to hill-side slopes of moderate relief and grade. The steepest slopes along the alignment surface are between 3rd St. (at Flower St.) and Olive St. (at 2nd St.). Review of the historical U.S. Geological Survey topographic map of the Hollywood Quadrangle shows a relatively narrow alluvial valley follows Flower St. from 6th St. up-gradient to 3rd St., then diverges to the northwest toward Glendale Blvd. (west of the 110- Harbor Freeway). This alluvial valley appears to be a tributary drainage course to an ancestral course of the Los Angeles River (i.e., prior to channelization of the modern Los Angeles River). The Los Angeles River floodplain covers the broad, gently sloping, alluvial terrain east of the Bunker Hill area. Artificial fill of variable thickness underlies the alignment in the near surface. The fill consists of mixtures of sand, silt, clay, with variable amounts of construction debris. Deep areas of fill to depths of approximately 25 feet below ground surface are locally present at abandoned tunnels (5th St.) and storm drain excavations that have been backfilled.

The numerous faults in Southern California include active, potentially active, and inactive faults. The criteria for these major groups are based on criteria developed by the California Geological Survey (CGS - previously the California Division of Mines and Geology) for the Alquist-Priolo Earthquake Fault Zoning Program. By definition, an active fault is one that has had surface displacement within Holocene time (about the last 11,000 years). A potentially active fault is a fault that has demonstrated surface displacement of Quaternary age deposits (last 1.6 million years). Inactive faults have not moved in the last 1.6 million years.

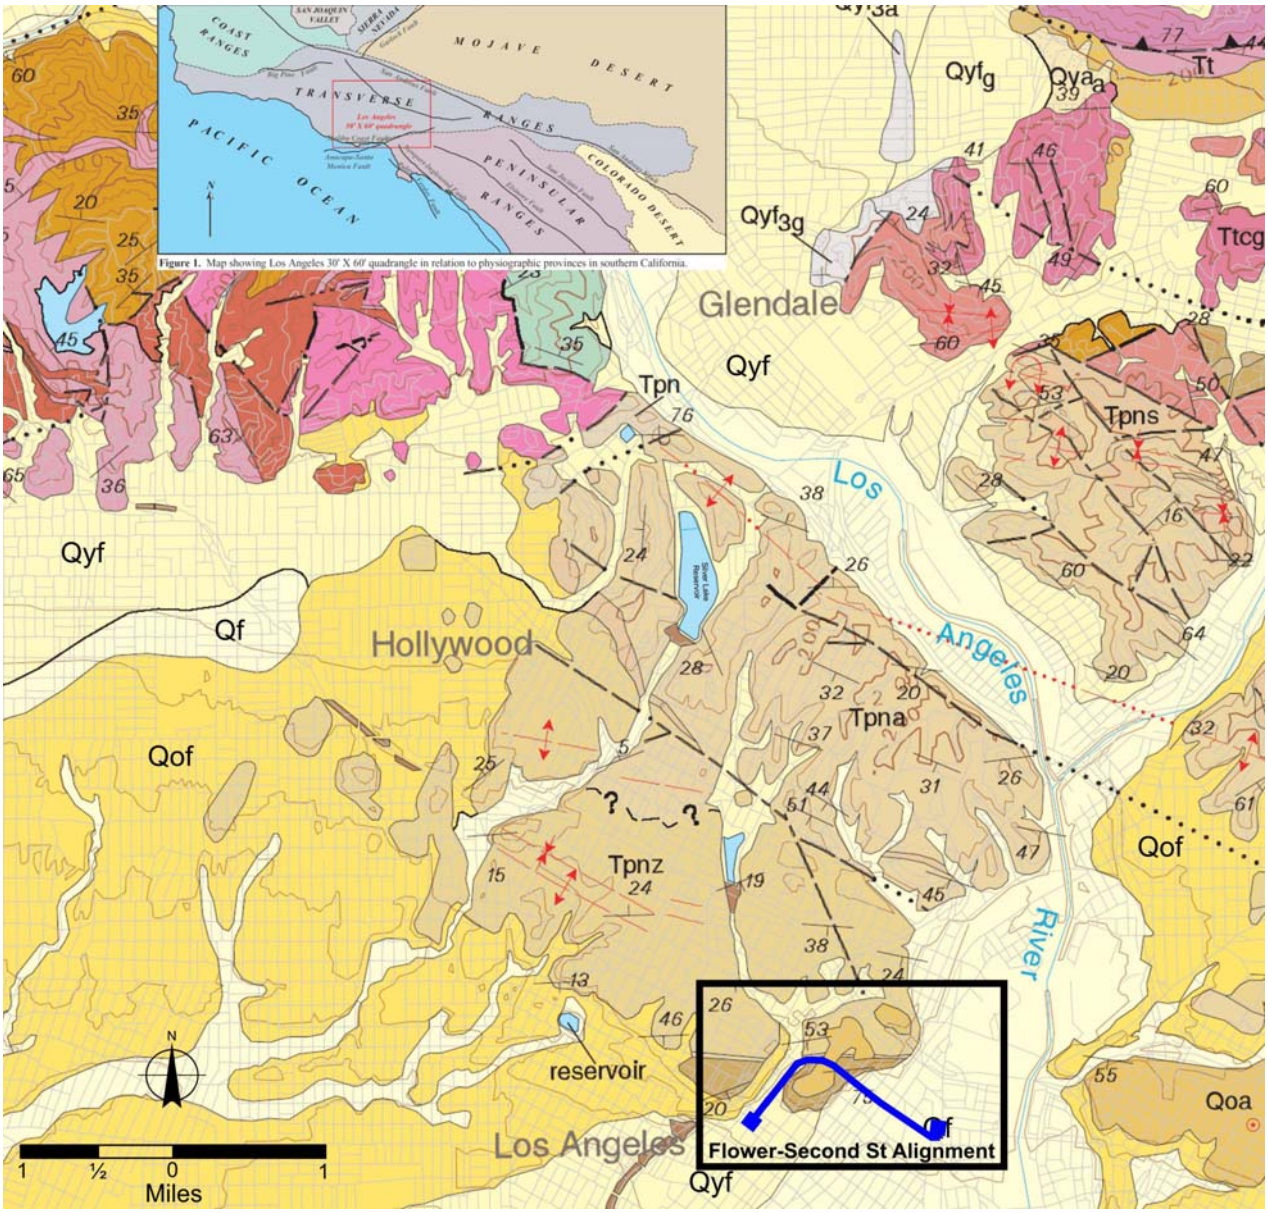

Figure 4-4 Regional Geology

Active and potentially active faults that are located within ten miles of the alignment are discussed below with respect to their known recency of displacement and location relative to the proposed alignments along Flower St. to 2nd St. Based on review of the available data, no known Holocene Active or Latest Pleistocene Active faults trend through the PSA. The PSA is not located within a currently established Alquist-Priolo earthquake fault zone for surface fault rupture. The faults in the vicinity of the site are shown in Figure 4-5, Regional Faults and Seismicity.

Active Faults

The Holocene active fault with surface expression closest to the PSA is the Hollywood fault, located approximately 3.9 miles to the northwest. Active blind thrust faults in vicinity of the site are discussed separately below. Holocene Active faults within ten miles of the planned alignment include the Raymond fault, the Newport-Inglewood fault zone, Verdugo fault and the Santa Monica fault. These faults, respectively, are located the following approximate distances from the proposed alignment; 5.9 miles southeast, 7.8 miles west-northwest, 8.4 miles north-northeast, and 9.6 miles west. The active Hollywood fault trends east-west along the base of the Santa Monica Mountains from the West Beverly Hills Lineament in the West Hollywood-Beverly Hills area to the Los Feliz area of Los Angeles. The fault is a groundwater barrier within Holocene sediments. Studies by several investigators have indicated that the fault is active based on geomorphic evidence, stratigraphic correlation between exploratory borings, and fault trenching studies. Although the Hollywood fault is considered active by the State Geologist, an Alquist-Priolo Earthquake Fault Zone has not yet been established for the Hollywood fault due to the poorly defined location along its length. The City of Los Angeles considers the Hollywood fault active for planning purposes and the CGS includes the fault in its database of seismic sources.

Potentially Active Faults

The inferred trace of the MacArthur Park fault is located approximately 0.5 miles southeast of the proposed alignment. The fault has not been definitively proven to exist. It is inferred west of downtown Los Angeles and has been located based on south-facing scarps, truncated drainages, and other geomorphic features. The Eagle Rock fault, a latest Pleistocene active fault is located approximately eight miles to the northeast.

Blind Thrust Fault Zones

Several buried thrust faults, commonly referred to as blind thrusts, underlie the Los Angeles Basin at depth. These faults are not exposed at the ground surface and are typically identified at depths greater than three kilometers. These faults do not present a potential surface fault rupture hazard, however, they are considered active and potential sources for future earthquakes. The nearest thrust is the Elysian Park Thrust. The Elysian Park Thrust, previously defined as the Elysian Park Fold and Thrust Belt, was postulated to extend northwesterly from the Santa Ana Mountains to the Santa Monica Mountains, extending westerly and paralleling the Santa Monica-Hollywood and Malibu Coast faults. The Elysian Park Thrust is now believed to be smaller in size, only underlying the central Los Angeles Basin. The Elysian Park Thrust underlies the PSA at depth (approximately six to nine miles below ground surface). Like other blind thrust faults in the Los Angeles area, the Elysian Park Thrust is not exposed at the surface and does not present a potential surface rupture hazard; however, the Elysian Park Thrust should be considered an active feature capable of generating future earthquakes with associated significant ground shaking and possible deformation of the near surface materials.

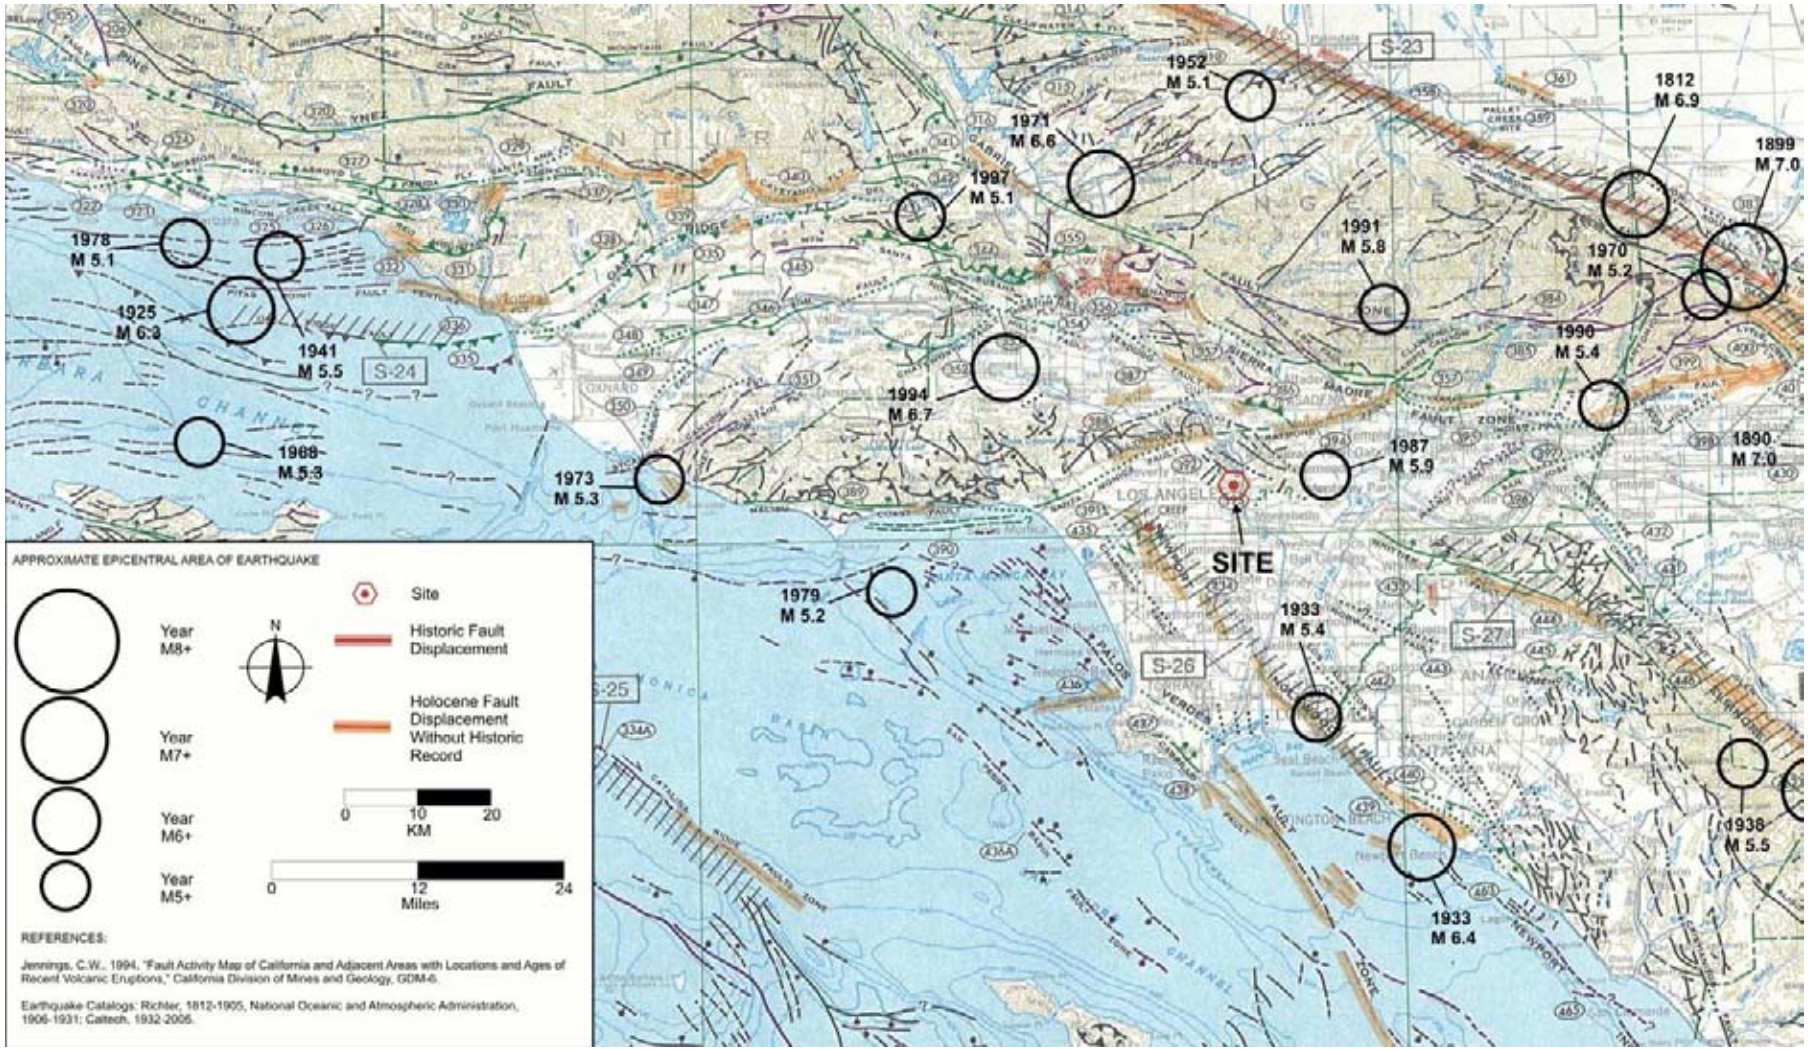

Figure 4-5 Regional Faults and Seismicity

In addition, the Elysian Park fault is a blind thrust fault located northeast of and at a shallower depth than the Elysian Park Thrust. The up-dip edge of the blind thrust fault tip is located about 0.6 miles north of downtown Los Angeles. The estimated, average recurrence-interval for events of the Elysian Park fault ranges from 500 to 1,300 years, with an estimated moment magnitude of up to 6.7. Evidence to define the activity of the Elysian Park fault is lacking; however, given the history of seismic events on blind thrust faults in the greater Los Angeles area (i.e., Whittier Narrows and Northridge earthquakes) and proximity to the PSA of this newly defined fault, the Elysian Park fault is considered active for planning and design of the project.

Coyote Pass Escarpment

The Coyote Pass Escarpment is a gentle south-facing, east-west trending topographic lineament that forms the southern flank of the Repetto Hills, from the Los Angeles River channel eastward to the Monterey Park area. The escarpment is an area of young, near-surface monoclinal folding, believed to be a result of fault rupture on the Elysian Park Thrust and/or the shallower Elysian Park fault. Although the trend of the escarpment beneath the floodplain west of the Los Angeles River has not been well defined, it has been inferred that the escarpment may align in the subsurface with the MacArthur Park escarpment, located west of the Harbor Freeway. The results of recent investigations of the Coyote Pass Escarpment indicate that the Elysian Park fault is active. Future fault rupture at depth along the Elysian Park fault and/or the Elysian Park Thrust could result in near-surface folding of the alluvial sediments and underlying bedrock in the area of the escarpment. Thus, no ground rupture is anticipated along the Coyote Pass Escarpment, but there is a potential for ground deformation (active folding) of the bedrock and the overlying alluvial sediments along the mapped location of the escarpment.

Landslides

Landslides occur in the City of Los Angeles and slope failures were instrumental in Los Angeles being one of the first municipalities in the nation to adopt hillside-grading ordinances. Rapid uplift of the mountainous areas of Los Angeles from past and ongoing tectonic movements gives rise to a geologic setting conducive to mass wasting. The variable nature of sediments and rocks exposed throughout Los Angeles, and the slope conditions created by uncontrolled grading, have led to frequent landslides of a variety of types. The hillside areas of Los Angeles, especially the central and eastern Santa Monica Mountains, have geologic and topographic conditions that are conducive to the development of surficial and gross landslides. The City of Los Angeles Department of Building and Safety regulates construction and development in hillside areas of Los Angeles. As part of the City of Los Angeles Building Code, and review process, the City has established a Hillside Ordinance, which specifies that a geologic report is required for proposed construction within hillside areas. The northwest portion of the PSA (area east of the 101/110 interchange) is within the Hillside Ordinance area.

Liquefaction

Liquefaction-induced ground failure has historically been a major cause of earthquake damage in Southern California. Significant damage to roads, utilities, pipelines, and buildings that occurred during the 1971 San Fernando and 1994 Northridge earthquakes was caused by liquefaction-induced ground displacement. Localities most susceptible to liquefaction-induced ground displacement are underlain by loose, water-saturated granular sediment within 50 feet of the ground surface. Liquefaction susceptibility generally decreases as the percentage of clay size particles in the soil increases and / or the coarse sand and gravel content increases.

In areas within the PSA, sediments susceptible to liquefaction comprise the young (Holocene to late Holocene age) alluvial fan deposits and young (Holocene) alluvial floodplain sediments. The older alluvial deposits are generally medium dense to dense and are considered by the CGS (1998, 2001) to have a low liquefaction susceptibility. The CGS has prepared seismic hazard maps for the Los Angeles Basin. The maps delineate liquefaction zones which have been defined by the CGS as areas where historic occurrence of liquefaction, or local geological, geotechnical and groundwater conditions indicate a potential for permanent ground displacement such that mitigation (as defined in the Public Resources Code) would be required. The CGS uses criteria developed by the Seismic Hazard Mapping Act Advisory Committee in delineating liquefaction zones on the seismic hazard maps. In areas of limited or no geotechnical data, susceptibility zones are evaluated using a combination of geologic considerations.

The CGS has rated the liquefaction susceptibility for the Holocene age sediments in the PSA as high if saturated within 40 feet of the ground surface and, if not saturated, the susceptibility is rated as low. In contrast, the liquefaction susceptibility of older alluvial sediments (terrace deposits) is rated as low or not likely irrespective of ground-water levels. In this framework, the CGS has identified the Holocene sediments along Flower St. between Wilshire Blvd. and 2nd St. to be within a potential liquefaction zone. Likewise, the CGS has identified the Holocene sediments along 2nd St. between Hill St. and San Pedro St. to be within a potential liquefaction zone. The young (Holocene) age deposits along the alignment, where present, are on the order of five to 35 feet thick. Preliminary alignment profiles show the tunnel crown elevations appear to be below the young alluvial deposits that are rated as highly susceptible to liquefaction. For station locations with shallow groundwater and younger alluvial deposits, station walls may have to be designed for greater than usual lateral earth pressures to account for liquefaction potential. Settlement beneath the planned stations due to liquefaction is considered remote due to the depth of the Fernando formation beneath the Holocene alluvium at preliminary station depths.

4.9.1.2 Hazardous Materials

The PSA is located in a highly developed area with a long history of commercial and industrial land use. As such, there is potential for the presence of hazardous materials in soil and groundwater within one-quarter mile of the build alternatives. Contaminated soil and groundwater could be found at former and current gas stations, dry cleaners, or

manufacturing facilities, and may include, but are not limited to, petroleum hydrocarbons, volatile and semi-volatile organic compounds, and metals.

Naturally-occurring hazardous materials may also exist within the PSA from known oil and gas fields and geologic formations. These may include petroleum hydrocarbons, methane, and hydrogen sulfide, as well as other hazardous materials associated with historic or current production operations.

Soil contamination can result from spills at industrial facilities or leaks from underground storage tanks. Initially, soil contamination would be primarily located at the point of release, which typically would not be within existing streets. However, depending on the amount of the release, the type of contamination, the soil type, and location of groundwater, contaminants can move vertically and laterally and become located within right-of-ways where the project would be constructed.

A regulatory database search was conducted to identify potential or existing conditions, including soil and/or groundwater contamination that would present environmental health and safety concerns within one-quarter mile of the two build alternatives. Table 4-9 below provides the regulatory databases included in the search.

Results of the search indicate there are approximately 500 regulatory database listings in the PSA. Many sites are listed on more than one regulatory database. The listings include all past and present generators, transporters, treaters, storers, and disposers of hazardous waste. In addition, properties where contamination has been remediated and is no longer present in soil and/or groundwater are listed.

The PSA would potentially cross the Union Station Oil Field (along 2nd St. east of Central Ave.). In addition, there are seven oil wells located between 1st and 2nd Streets on the west side of Garey St. and west of Vignes St. Six of these wells were abandoned in June 2005 and the seventh well was abandoned prior to 2005. The Union Station Oil Field has been delineated as a Methane Zone by the City of Los Angeles Department of Public Works, Bureau of Engineering. Due to the proximity to the oil field, the potential for methane gas exists along the proposed alignments. The proposed alignments would cross this buffer zone north of 3rd St. and west of Grand Ave.

4.9.2 Evaluation Methodology

Geologic-related issues include subsurface geology and soils, seismicity, landslides, and liquefaction. All available data was reviewed in identifying potential geologic impacts within the PSA. As detailed above, a regulatory database search was conducted to identify potential or existing conditions, including soil and/or groundwater contamination that would present environmental health and safety concerns within one-quarter mile of the build alternatives.

4.9.3 Environmental Issues

4.9.3.1 Geology and Subsurface Conditions

As part of standard practice and the predesign process, a geotechnical study would be prepared to identify geotechnical conditions and design features (such as foundation requirements and the maximum credible design earthquake) that would have to be included as part of the project design. The seismicity of Southern California is dominated by movements on the intersecting northwest-southeast trending San Andreas fault system and the east-west trending faults of the Transverse Ranges fault system. The Los Angeles Basin is located south of the intersection of these two systems. Both of the build alternatives would be potentially impacted by the fault systems. Both the At-Grade Emphasis LRT Alternative and Underground Emphasis LRT Alternative would be designed and constructed in accordance with all applicable earthquake standards to ensure the greatest protection from earthquakes. With respect to landslides, if the most western portion of the At-Grade Emphasis LRT Alternative is within the Hillside Ordinance area, then design and construction would be in accordance to all applicable standards and ordinances. Where liquefaction concerns are present, final engineering specifications would determine the proper footings and/or foundations along the alignment, as well as at the station locations.

Neither the construction nor the operation of the project would be expected to cause, accelerate, or exacerbate geologic hazards that would result in substantial damage to structures or infrastructure, or that would expose people to increased risk of hazards. Construction and operation would not cause or accelerate instability from erosion, expansion or settlement or offsite sediment runoff.

4.9.3.2 Hazardous Materials

A large number of sites where hazardous materials may be present are located within one-quarter mile of the two build alternatives, indicating that localized areas of contaminated soils and groundwater could be encountered during the construction of the project.

The At-Grade Emphasis LRT Alternative may offer an advantage over the Underground Emphasis LRT Alternative in avoidance of soil contamination from sources such as underground storage tanks. In addition, naturally-occurring hazardous materials such as petroleum hydrocarbons, methane (portions of the PSA are within a methane zone), and hydrogen sulfide would be less of a concern with the At-Grade Emphasis LRT Alternative. However, hazardous materials in surface soils and potentially shallow groundwater would be a potential concern with construction of any of the promising alternatives.

4.10 Water Resources

This section provides an overview of water resources within the PSA, regulatory requirements, and the potential environmental issues associated with each alternative. Water resources include surface water hydrology, flood hazards, tsunamis, inundation, seiches, and groundwater.

4.10.1 Affected Environment

4.10.1.1 Regulatory Framework

Clean Water Act: The EPA regulates water quality under the Clean Water Act (CWA) also known as the Federal Water Pollution Control Act. Enacted by the EPA in 1972, the CWA is designed to restore and maintain the chemical, physical, and biological integrity of waters of the United States. The CWA provides the legal framework for several water quality regulations including National Pollution Discharge Elimination System (NPDES) Permits, effluent limitations, water quality standards, pretreatment standards, antidegradation policy, non-point source discharge regulation, and wetlands protection. EPA has delegated the responsibility of portions of the CWA to state and regional agencies, including the State of California; therefore the primary regulations resulting from the CWA are discussed in the state and local regulation descriptions that follow.

National Flood Insurance Act: The U.S. Congress established the National Flood Insurance Program (NFIP) with the passage of the National Flood Insurance Act of 1968. NFIP is based on the minimal requirements for flood plain management and is designed to minimize flood damage within Special Flood Hazard Areas. Flood Insurance Rate Maps are developed by FEMA to determine if a particular parcel lies in a designated Special Flood Hazard Zone.

Porter-Cologne Water Quality Control Act: The Porter-Cologne Water Quality Control Act (embodied in the California Water Code [CWC]) established the principal California legal and regulatory framework for water quality control. The CWC authorizes the State Water Resources Control Board (SWRCB) and Regional Boards to implement the provisions of the federal CWA. The alternative alignments are located in Region 4, also known as the Los Angeles Regional and governed by the Los Angeles Regional Water Quality Control Board (LARWQCB).

NPDES Permit Program: The NPDES program controls water pollution by regulating point sources that discharge pollutants into waters of the United States. In California the permits are issued by the SWRCB or Regional Boards. The applicable permits include:

- NPDES General Permit for Storm Water Discharges Associated with Construction Activities issued by the SWRCB. The General Permit includes measure to eliminate or reduce pollutant discharges through a Stormwater Pollution Prevention Plan (SWPPP), which describes the implementation and maintenance of Best Management Practices (BMPs) to control stormwater and other runoff during and after construction.

- NPDES Los Angeles County Municipal Storm Water Discharge Permit issued by the LARWQCB. Under the MS4 Permit, the County and City are required to implement development planning guidance and control measures that control and mitigate stormwater quality and quantity impacts to receiving waters as a result of new development and redevelopment. The MS4 Permit requires permittees to implement a Standard Urban Stormwater Management Plan (SUSMP) that designates BMPs that must be used in specified categories of development and redevelopment projects to

infiltrate, filter, or treat stormwater runoff, control peak flow discharges, and reduce the post-project discharge of pollutants from stormwater conveyance systems.

Basin Plan: As required by the CWC, the Regional Board adopts and periodically updates a plan entitled "Water Quality Control Plan, Los Angeles Region: Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties" (Basin Plan). The Basin Plan designates beneficial uses for bodies of water, sets numerical (quantitative) and narrative (qualitative) water quality objectives applicable to inland surface waters and enclosed bays and estuaries, and includes implementation provisions, programs, and policies to protect all waters in the Los Angeles region.

California Toxics Rule: The EPA has established water quality criteria for certain toxic substances via the California Toxics Rule (CTR). The CTR established acute (i.e. short term) and chronic (i.e. long term) standards for bodies of water such as inland surface waters and enclosed bays and estuaries that are designated by the LARWCB as having beneficial uses protective of aquatic life or human health, such as the Los Angeles River.

California Impaired Water Bodies: Under Section 303(d) of the CWA, the SWRCB identifies impaired bodies of water that do not meet water quality standards and together with the Regional Boards prioritizes and schedules them for development of Total Maximum Daily Loads (TMDLs).

California Nonpoint Source Pollution Control Program: The State Board and the California Coastal Commission (CCC) developed the Nonpoint Source Pollution Control Program in California, which contains management measures for categories of land use/development. Under the Nonpoint Source Program Strategy and Implementation Plan 1998-2013, a three-tier system of BMPs is used as a means of implementing nonpoint source water quality management measures and strategies.

State Antidegradation Policy: In accordance with the federal Antidegradation Policy discussed above, the State Board adopted Resolution No. 68-16, Statement of Policy with Respect to Maintaining High Quality Waters in California (more commonly referred to as the State Antidegradation Policy) which restricts the degradation of surface waters of the state and protects bodies of water where the existing water quality is higher than necessary for the protection of present and anticipated designated beneficial uses. The State Antidegradation Policy is implemented by the Regional Board.

Flood Control: Drainage and flood control structures and improvements in the City of Los Angeles are subject to review and approval by the City of Los Angeles Bureau of Engineering. The City utilizes a 50-year design storm for flood control design purposes, which is a predicted storm event estimated using the City's methodology and assumption, which are considered to be conservative.

4.10.1.2 Existing Conditions

The two build alternatives are in the general vicinity of each other when viewed from a water resources perspective. For purposes of this section, the environmental setting is discussed for the general vicinity and not for the individual alternatives, except where differences in the alternatives may result in potential environmental issues.

Surface Water Hydrology

Hydrologic conditions in the area, natural and man-made, cause runoff within the watershed to drain to a receiving water body. For purposes of the municipal NPDES Stormwater Permit, the LARWQCB has defined Watershed Management Areas (WMA). The alternatives are located in the Los Angeles River WMA.

The alternative alignments are located in the downtown portion of the City of Los Angeles. This area is characterized as highly urban with no or limited pervious surfaces. Surface runoff is characterized as either dry weather or wet weather flows. Water quality of the runoff is determined by the quality of water of the water discharged and by the materials runoff collects on its way to a waterbody. The Los Angeles River watershed and many of its tributaries are on the CWA Section 303(d) list of impaired uses for not meeting water quality standards.

Flood Hazards

The City of Los Angeles, in coordination with Los Angeles County, state, and federal agencies has an extensive system for providing protection against flood hazards. The system drains wet and dry weather runoff from impervious surface areas, such as streets, and routes flows into underground pipes and drains discharging to various inland streams and channels. According to FEMA, there are no 500- or 100-year flood zones within the general vicinity of the alternatives.

Tsunami, Inundation, Seiche

Tsunamis are large ocean waves generated by major displacement of the ocean, such as earthquakes, volcanic eruptions, and submarine landslides. Low lying coastal areas of the City of Los Angeles are potentially at risk from tsunamis. A seiche is a standing wave in an enclosed or partially enclosed body of water, including water storage facilities. Seiches have multiple causes, including earthquakes and wind. Inundation is flooding related to a tsunami, seiche or other event. The alternatives are located more than 15 miles from the ocean and are not within a tsunami inundation area as determined in the City of Los Angeles Safety Element. Two small lakes, Hollenbeck Lake and Echo Park Lake, are the closest enclosed bodies of water and are located more than one mile from the vicinity of the alignments. The Los Angeles River is located at a distance greater than 2,000 feet to the east of the PSA.

Multiple flood control facilities are located upgradient of the PSA in the San Fernando Valley portion of the Los Angeles River watershed. According to the City of Los Angeles Safety Element Exhibit G, failure of upgradient flood control basins could potentially cause inundation in the vicinity of the alignments. Both build alternatives are at the edge of an inundation area where the alignments cross (as an underpass) Alameda St. under Temple St. (At-Grade) and under 1st St. (Underground).

Groundwater

The Coastal Plain of Los Angeles Basin underlies the PSA. This groundwater basin is divided into four subbasins, with the Central Subbasin directly underlying the PSA. The Central Subbasin has a surface area of approximately 277 square miles with an estimated storage capacity of 13,800,000 acre-feet. Potable water production occurs throughout the majority of the basin via approximately 497 wells. Most groundwater production occurs in deep aquifers of the San Pedro Formation. No production wells are located in the vicinity of the PSA. In addition, aquifer recharge, which flows mainly in the permeable sediments at the ground surface, is not an issue for the PSA as the closest recharge area is located in the northern portion of the subbasin where the Los Angeles River enters the subbasin at the Los Angeles Narrows.

Groundwater levels vary across the subbasin. According to the EDR report, depth to groundwater in the project vicinity is approximately 37 feet and groundwater flows in a southeast direction. Exploratory borings drilled for many building sites adjacent to Flower St. between 7th and 2nd Streets encountered seepage at relatively shallow depths ranging from approximately 15 to 35 feet below ground surface. Groundwater, probably perched, has been reported in borings at depths between approximately 18 to 27 feet below ground surface adjacent to Flower St. in the area between 2nd and 5th Streets. In the portion of the proposed alignment along 2nd St., groundwater seepage water has been reported in borings at depths between approximately 14 to 36 feet below ground surface in the area between Hill St. and Alameda St. The seepage water encountered in the borings appears to be groundwater that is perched on the underlying Fernando formation bedrock. It should be noted that shallow groundwater levels are influenced by seasonal rainfall and infiltration in addition to possible nearby groundwater extraction.

Water quality in the main production zones is generally good with localized areas of poor water quality. Constituents of concern present in localized areas are total dissolved solids, volatile organic compounds (tetrachloroethylene and trichloroethylene), perchlorate, nitrate, iron and manganese, and chromium. According to the EDR report, there are localized areas that have experienced groundwater contamination in the vicinity of the PSA.

4.10.2 Evaluation Methodology

To determine potential environmental issues associated with water resources in relation to the alternatives, regulatory requirements and laws were reviewed at the federal, state, and local level.

4.10.3 Environmental Issues

Potential environmental issues related to water resources are discussed for the PSA and where applicable for specific alternatives.

Surface Water Hydrology

As stated above, the general vicinity of the PSA is highly impervious with limited or no pervious areas. The alternatives are not expected to increase imperviousness or increase runoff volumes within the Los Angeles River WMA. The alternatives are not expected to alter existing flow patterns.

Construction and operation of the alternatives are not expected to significantly impact surface water quality. Construction of any of the alternatives will require filing a Notice of Intent, preparation of a SWPPP, and compliance with the NPDES General Construction Permit and SUSMP requirements. BMPs will be identified to provide for temporary stormwater management during construction preventing the construction process from exposing people or property to water related hazards and keeping pollutants from being discharged to receiving water. Any dewatering discharges to the storm drain system and/or sewer system associated with tunneling will be required to meet minimum discharge requirements to not adversely impact surface waters. Construction and operation of the alternatives is not expected to adversely impact any designated beneficial uses of the Los Angeles River.

Flood Hazards

The alternative alignments are not located in a 100- or 500-year flood zone as determined by FEMA. Construction and operation of the alignments would not alter any existing flood zones.

Tsunami, Inundation, Seiche

The build alternatives are not located within a tsunami inundation zone as the alternatives are not in vicinity of the coast as discussed above.

The alternatives are partially located within the outlying edges of the inundation zone established for the unlikely failure of an upgradient flood control facility. The area between the intersection of 1st and Alameda Streets and Temple and Alameda Streets is at the edge of the inundation zone. Mitigation during engineering would include appropriate design features to alleviate any hazards associated with the inundation zone.

Inundation from a seiche is not a potential hazard, as the nearest enclosed or partially enclosed bodies of water are greater than one mile from the alternative alignments and the size of the waterbodies is limited.

Groundwater

The exact depths to groundwater in the PSA are not currently known. If groundwater is encountered, any dewatering activities are not anticipated to adversely affect groundwater flow, recharge, or production. Dewatering activities would not affect management of the subbasin. As discussed above, no groundwater production occurs in the PSA. Recharge in the area is restricted due to the lack of pervious surfaces.

If any groundwater is encountered all groundwater will be discharged, and treated if necessary, prior to disposal, in accordance with all applicable regulations. Dewatered groundwater requires treatment prior to discharge to comply with an NPDES permit issued by the LARWQCB or pretreatment requirements for discharge to the sewer system.

Localized groundwater contamination occurs on a limited basis in multiple areas in the downtown vicinity. Local contamination sources in the vicinity of the alignments include underground storage tanks and former manufactured gas sites. Contaminants may include gasoline, diesel fuel, and waste oil among other pollutants. Therefore, there is the potential that if groundwater is encountered and dewatering is required water could be contaminated and may need to be treated prior to discharge. During construction any tunneling could potentially serve as a preferential pathway for contaminated groundwater if it is encountered, thereby spreading groundwater contamination at higher rates than would normally occur. This can be mitigated during the engineering process with specifications for impermeable concrete-based grouting materials to fill the gap between the tunnel and surrounding earth. The permeability of the grouting materials would be lower than the surrounding soil types reducing the possibility that the tunnel would serve as a preferential pathway for contamination migration.

At-Grade Emphasis LRT Alternative

This alternative is at-grade for the majority of the proposed alignments and would have a low probability of encountering groundwater during construction. The portions of the alignments for the At-Grade Emphasis LRT Alternative that are below-grade traverse the same proposed alignment as the Underground Emphasis LRT Alternative. Engineering and design specifications would mitigate any previously discussed potential issues associated with groundwater dewatering.

Underground Emphasis LRT Alternative

The Underground Emphasis LRT Alternative is below-grade for the entire alignment except for a limited portion at-grade at the connection point with the Metro Gold Line. Construction of the Underground Emphasis LRT Alternative would result in a higher probability of encountering groundwater during construction. Engineering and design specifications would mitigate any previously discussed potential issues associated with groundwater dewatering.

4.11 Energy

The transportation sector is responsible for approximately half of the energy consumed in the State of California[2]. Transportation energy consumption estimates consider:

- Annual vehicle miles traveled (VMT) for automobiles, trucks, buses and heavy rail vehicles and
- Variation of fuel consumption rates by vehicle type.

Fuel consumption has grown approximately 50 percent over the last 20 years, and is projected to continue to increase over the next 20 years. The proposed alternatives are anticipated to reduce energy consumption by providing an alternative to dependence on personal automobiles, thereby reducing VMT.

4.11.1 Affected Environment

Each alternative would require the installation of an overhead catenary system (OCS), suspended above the track-way to supply electricity to the trains. Traction power substations would be situated approximately every mile along the corridor to transmit and distribute electricity. Signaling and communication systems would also be required. Energy consumption would also be associated with operation of stations, stations and transit service maintenance, and construction activities to provide the required infrastructure.

Within the PSA, the Los Angeles Department of Water and Power (LADWP) provides electricity services. Electrical services are readily available to the PSA, with existing lines located along each of the proposed alignments.

4.11.2 Evaluation Methodology

To determine potential environmental issues associated with energy, a general review of energy requirements associated with operation and construction of the new alignments was conducted. The energy needs were considered in conjunction with the potential benefits associated with a diversion of automobile traffic to transit.

4.11.3 Environmental Issues

While construction and operation of all proposed alignments would have electrical energy expenditures associated with construction and operation, a new transit alignment is anticipated to decrease vehicle miles traveled and thereby decrease the consumption of fossil fuels.

Depending on the number of rail cars and frequency of operations, propulsion of each alternative would have similar energy consumption needs. The at-grade open air platforms associated with the At-Grade Emphasis LRT Alternative would have less energy needs than the underground stations, which would have escalators, elevators, and heating

[2] The California Energy Commission, Consumer Energy Center website. Accessed on June 23, 2008. http://www.consumerenergycenter.org/transportation/index.html.

and cooling systems. The Underground Emphasis LRT Alternative would require more energy resources during construction when compared to the At-Grade Emphasis LRT Alternative associated with the use of earthmoving equipment for excavating tunnels. Also, the extensive amount of haul trucks and haul truck travel of excavated earthwork would require additional energy consumption.

To maximize potential benefits associated with a reduction in vehicle miles traveled for each alternative, coordination between other Metro commuter rail lines, LRT, and bus transit is needed in order to optimize efficiency and convenience to minimize energy consumption.

A further consideration is projected ridership for each alternative. The greatest potential benefit associated with a reduction in VMT would be associated with any alternative that achieves a higher ridership level, thereby achieving the greatest reduction in the use of personal automobiles.

4.12 Historic, Archaeological & Paleontological Resources

This section addresses archaeological and built environment resources located in the PSA that qualify as "historic properties" as defined in Section 106 of the National Historic Preservation Act of 1966 (as amended) and "historical resources" as identified in CEQA. The definitions for both historic properties and historical resources include archaeological as well as built resources. In addition, the section discusses paleontological resources located in the PSA.

4.12.1 Affected Environment

4.12.1.1 Regulatory Framework

Historical Resources

- **National Historic Preservation Act**: The National Historic Preservation Act (NHPA) of 1966 (16 United States Code, USC 470-470), as amended, created the Advisory Council on Historic Preservation (Advisory Council) to advise the President and Congress on historic preservation. This Act also expanded the National Register of Historic Places (National Register) to include sites not only of national, but of state and local significance. The NHPA is a national policy to protect, rehabilitate, restore, and reuse districts, sites, buildings, structures, and objects significant in American architecture, history, archaeology, and culture, and it mandates (under Section 106) that federal agencies take into account the effect of an undertaking on properties that are listed in, or determined eligible for inclusion in the National Register of Historic Places.

- **Section 106**: Section 106 of the NHPA requires that Federal agencies take into account the effects an action is expected to have on historic properties. It requires that the Advisory Council be afforded a reasonable opportunity to comment on such actions, when they are expected to result in effects on historic properties.

- **National Register of Historic Places**: The National Register is the nation's official list of districts, sites, buildings, structures, and objects worthy of preservation. Currently, the National Register includes approximately 80,000 listings, including icons of American architecture, engineering, culture, and history. Overseen by the National Park Service (NPS), under the Department of the Interior, the National Register was authorized under the NHPA, as amended. National Register guidelines for the evaluation of significance were developed to be flexible and to recognize accomplishments of all who have made significant contributions to the history and heritage of the nation. Its criteria are designed to guide state and local governments, federal agencies, and others in evaluating potential entries in the National Register.

- **National Historic Landmarks**: National Historic Landmarks (NHL) are cultural properties designated by the Secretary of the Interior as having national significance. They are acknowledged as being among the most significant historic places, and these buildings, sites, districts, structures, and objects possess exceptional value or quality in illustrating or interpreting the heritage of the United States in history, architecture, archaeology, engineering, and culture. NHL designation is an official recognition by the federal government of the significance of historic properties. By definition, the properties designated as National Historic Landmarks are the most significant places in American history.

- **United States Department of Transportation Act of 1966 – Section 4(f)**: Historic properties are also governed under Section 4 (f) of the United States Department of Transportation Act of 1966 (recodified as amended at 49 USC Section 303), which regulates the "use" of land from historic properties. In 49 USC 303 Section 771.135, Section 4(f) asserts:

  (a) (i) The Administration may not approve the use of land from a significant publicly owned public park, recreation area, or wildlife and waterfowl refuge, or any significant historic site unless a determination is made that:

  (i) There is no feasible and prudent alternative to the use of land from the property; and

  (ii) The action includes all possible planning to minimize harm to the property resulting from such use.

- **California Code of Regulations**: As defined by state law in Title 14 *California Code of Regulations* Section 4850, the term "historical resource" means "any object, building, structure, site, area, place, record, or manuscript, which is historically or archaeologically significant, or which is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural history of California. Historical resources include archaeological sites as well as the built environment.

- **California Register of Historical Resources**: Under PRC §5024.1, the California Register was established to serve as an authoritative guide to the state's significant historical and archaeological resources. In order for a property to be considered eligible for listing in the California Register, resources must retain "substantial" integrity to identified periods of significance, and it must be found by the State Historical Resources Commission to be significant under at least one of the below-listed criteria.

    - Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.

    - Is associated with the lives of persons important in our past.

    - Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual or possesses high artistic values.

    - Has yielded, or may be likely to yield, information important in prehistory or history.

There are two principal categories of local designation for historically significant properties in the City of Los Angeles. Properties may be designated as Historic-Cultural Monuments and/or may be contributors to designated local historic districts, known as Historic Preservation Overlay Zones (HPOZs). The HPOZ designation applies to specific bounded areas of historic or cultural significance and generally includes both properties which contribute to the significance of the district and non-contributing properties. Non-contributing properties are those which do not contribute to the significance of the HPOZ because they have undergone alterations, were built outside the period of significance, or do not share the unifying characteristics of the district.

Historic-Cultural Monuments: In the City of Los Angeles, the Historic-Cultural Monument (HCM) designation is equivalent to local landmarks in other communities and is reserved for individually significant properties. Listing as an HCM is subject to review and recommended approval by the Cultural Heritage Commission, review by an additional committee of City Council, and final approval by the City Council.

Historic Preservation Overlay Zones: The Historic Preservation Overlay Zone Ordinance was adopted by the City of Los Angeles in 1979, and revised in 1997. As defined in the Cultural Heritage Master Plan (adopted by City Council in 2000), the HPOZ designation is "a planning tool which recognizes the special qualities of areas of historic, cultural, or architectural significance. An HPOZ does not change the underlying zoning, rather it lays an added level of protection over a zone through local board oversight." There are currently 22 designated HPOZs in Los Angeles, incorporating more than 5,000 separate properties. Many more are currently proposed in various stages of development. Because HPOZs have "special character or special historical, cultural, architectural, archeological, community or aesthetic value," they are presumed to be historically or culturally significant and are therefore listed in the California Register.

Paleontological Resources

Federal protection for scientifically significant paleontological resources applies to projects if any construction or other related project impacts occur on federally owned or managed lands, involve the crossing of state lines, or are federally funded. The following federal protections may apply to paleontological resources within the proposed PSA:

- **American Antiquities Act of 1906**: The American Antiquities Act of 1906 (6 USC 431 433) establishes a penalty for disturbing or excavating any historic or prehistoric ruin or monument or object of antiquity on federal lands as a maximum fine of $500 or 90 days in jail.

- **National Historic Preservation Act of 1966**: The National Historic Preservation Act of 1966 (Pub. L. 89 665; 80 Stat. 915, 16 U.S.C. 470 et seq.) provides for the survey, recovery, and preservation of significant paleontological data when such data may be destroyed or lost due to a federal, federally licensed, or federally funded project.

- **Federal Land Management and Policy Act of 1976**: The Federal Land Management and Policy Act of 1976 (43 U.S.C. 1712[c], 1732[b]); sec. 2, and 30 U.S.C. 611; Subpart 3631.0 et seq.) defines significant fossils as: unique, rare or particularly well-preserved; an unusual assemblage of common fossils; being of high scientific interest; or providing important new data concerning [1] evolutionary trends, [2] development of biological communities, [3] interaction between or among organisms, [4] unusual or spectacular circumstances in the history of life, or [5] anatomical structure.

- **Public Resources Code (Chapter 1.7), §5097.5 and §30244:** These statutes prohibit the removal of any paleontological site or feature on public lands without permission of the jurisdictional agency, define the removal of paleontological sites or features as a misdemeanor, and require reasonable mitigation of adverse impacts to paleontological resources from developments on public (state) lands.

City of Los Angeles General Plan: The Conservation Element of the City of Los Angeles General Plan (adopted September 2001) specifically addresses paleontological resources in Section 3 of Chapter 2. The Plan's paleontological objective is to "protect the city's archaeological and paleontological resources for historical, cultural, research and/or educational purposes." The Plan's policy is to "continue to identify and protect significant archaeological and paleontological sites and/or resources known to exist or that are identified during land development, demolition or property modification activities."

4.12.1.2 Existing Conditions

Historical Resources

Historically, the PSA falls within the Gabrieliño/Tongva (also known as the Tongva) tribal boundaries. The Tongva established large, permanent villages in the fertile lowlands along rivers and streams, and in sheltered areas along the coast, stretching from the foothills of the San Gabriel Mountains to the Pacific Ocean. The fundamental economy of the Tongva was one of subsistence gathering and hunting. The ethnographic and historic literature indicates that the Native American village of Yangna is located in the general

vicinity of the PSA. It is assumed to be on the west bank of the Los Angeles River, just south of the Pueblo of Los Angeles.

Settlement of the Los Angeles region continued in the early American Period (1848–Present). On April 4, 1850, only two years after the Mexican-American War and five months prior to California achieving statehood, the City of Los Angeles was formally incorporated. Los Angeles maintained its role as a regional business center in the early American Period and the transition of many former rancho lands to agriculture, as well as the development of citriculture in the late 1800s, further strengthened this status. These factors combined with the expansion of port facilities and railroads throughout the region contributed to the impact of the real estate boom of the 1880s on the City of Los Angeles. Los Angeles continued to grow in the twentieth century in part due to the discovery of oil in the area and its strategic location as a wartime port. The County's mild climate and successful economy continued to draw new residents in the late 1900s, with much of the County transformed from ranches and farms into residential subdivisions surrounding commercial and industrial centers. Hollywood's development into the entertainment capitol of the world and southern California's booming aerospace industry were key factors in the County's growth in the twentieth century.

The PSA is located entirely within the downtown area of the City of Los Angeles. The development of downtown Los Angeles occurred sequentially from north to south. In the *Los Angeles Architectural Guide*, there are three principal downtown commercial building periods: 1900-1917, early 1920s through 1931, and from the late 1960s through the present. The first two major periods of activity were characterized principally by classical *Beaux Arts* style, based on great buildings of Western Europe and most of those efforts were focused on Broadway and Spring St. The 1920s and 1930s brought development patterns west on 7th St. and included the geometrical-based Art Deco and sweeping Streamline Moderne styles. Finally, high rises constructed from the early 1960s until the present have been a variety of Contemporary styles, encompassing approaches from glass curtain wall Corporate Modern to Post Modern styles.

The first Sanborn Fire Insurance Company maps prepared for Los Angeles in 1888 portrayed north-south streets in the below-listed west-to-east order: Pearl St. (now Figueroa St.), Flower St., Hope St., Bunker Hill Ave. (not applicable to current street name), Grand Ave., Olive Ave., Hill St., Fort St. (now Broadway), Spring St., Main St. and Los Angeles St.

For the purposes of discussion, the PSA was divided into four segments, arranged from south to north, and then east, and are described below.

Flower St., between 4th and 7th Streets

In 1888, the streets in the southern portion of the PSA were located on the outskirts of town. Figueroa St. was one of a handful of great boulevards of Los Angeles that was expanded in the 1920s. An early alignment of Figueroa St. was part of the famed U.S. Route 66, and is currently a component of the Pasadena Freeway (Interstate 110). The notable Figueroa St. tunnels near Chinatown were built in 1931 and were once a part of Figueroa St. as well. Figueroa St. is said to be one of the longest avenues in the United

States, with a length of more than 30 miles, stretching between Eagle Rock to the Los Angeles Harbor. The 2nd St. tunnel, which extends from Figueroa St. on the west side to Hill St. in the east, was completed in 1925.

Among the ambitious 1920s building projects in downtown that announced Los Angeles as a major city, the Los Angeles Central Library (630 West 5th St., Bertram Goodhue with Carleton Winslow) was completed in 1926. The "light of learning" architectural theme was a remarkable architectural collaboration and remains one of the largest library systems in the nation.

The Harbor Freeway (Interstate 110) on the western side of downtown was completed in 1952, and coined "downtown's new Main St." Construction of that freeway, along with repeal of the limiting building height ordinance, created a significant new concentration of high- and mid-rise buildings concentrated on Figueroa and 7th Streets.

Flower St., between 4th St., and 2nd St. East to Hill St.

By the end of the second World War, as suburbs became increasingly desirable as residential and commercial hubs, downtown Los Angeles lost some of its *caché* as a business and retail destination. The CRA was established in 1948, in part to cure economic "blight" by funding and overseeing redevelopment. Like the rest of downtown, Bunker Hill, which had been one of the more exclusive residential neighborhoods at the turn of the twentieth century, fell into disrepair and out of fashion by the 1960s. Although the action was controversial, Victorian era buildings on Bunker Hill were cleared in the 1960s by CRA, the streets were reconfigured and high-rises have been constructed over time in their places.

2nd and Temple Streets between Hill and San Pedro Streets

As Los Angeles developed from an agrarian settlement to a more diverse economy, single-family homes were typically built without regard to their surroundings in the area now identified as downtown. By the early 1900s, those residences stood side-by-side with commercial blocks, and residential use eventually diminished. Broadway evolved as a main retail thoroughfare, served by Pacific Electric (PE) interurban rail lines. Many of the PE's routes terminated at 4th St. and Broadway. Public use of the PE peaked in 1924 and its configuration made the intersection and corridor valuable commercial property, concentrated in one confined area. Broadway was developed with commercial uses, specifically retail and theater buildings between the 1910s and the 1940s and was the center of retail commerce in the growing City of Los Angeles. After the end of World War II, the decentralization of the community, coupled with demise of the interurban railroad, caused major stores and small shops to relocate to 7th St., later disbursing to outlying suburbs. As of the millennium, Broadway continues to be a busy retail center, although patronage changed since the early nineteenth century from American-born to Latino. The customer base of the area is primarily Mexican-American and South American. The Broadway Theater & Commercial District comprised of office, retail and theater buildings, was listed in the National Register in 1979 and includes portions of the PSA.

Adopted in 1947, the plan for the Civic Center included buildings of contemporary design flanked by multi-acre parking lots. The Civic Center replaced business blocks of the late nineteenth century and has encroached westward upon Bunker Hill. The resulting Civic Center has an east-west axis and is roughly bounded on the north by Aiso St., on the south by 2nd St., on the west by Grand Ave., and on the east by Alameda St.

2nd and Temple Streets between San Pedro and Alameda Streets

The City's oldest areas, just east of Main St. exhibit the imperfect platting that dates before 1848. The 33 degree "skewed" grid orientation of downtown Los Angeles characterizes the north-south streets east of Hoover Ave. and west of Indian St. When Los Angeles converted from a Mexican pueblo to an American town, public authority rather than private enterprise became the influence behind development. As enumerated in *California: A Land of Contrast*, "few vestiges of the original community remain; the much-altered plaza is a tiny park with adjacent Olvera St. 'restored' as a tourist attraction." The original Chinatown was replaced in the 1938 by the Union Passenger Terminal (now Union Station), relocated and reconstructed in a stylized Chinese theme. The construction of Union Station also alleviated the need for multiple passenger railroad stations in downtown Los Angeles. The first Japanese-American resident came to Los Angeles in 1886 and started a restaurant on East 1st St. By the end of the nineteenth century, the area known as Little Tokyo was home to more than 2,000 Japanese-Americans, and a thriving community had been established. Many of those residents moved to the area to lay track for the Pacific Electric interurban streetcar system. During World War II, Executive Order 9066 gave the Army authority to relocate more than 110,000 Japanese Americans on the west coast to internment camps in isolated and barren areas. This action eradicated Japanese settlements until after the end of the war and caused interned families to start their lives over once they were released. Little Tokyo Historic District was listed in the National Register of Historic Places, and became a National Historic Landmark district in 1995.

In summary, the development of downtown Los Angeles, which began with the City's founding in the 18th century, continues to evolve in diverse ways over time. Early downtown Los Angeles was primarily residential and commercial in nature. In the 20th century, uses in the "core" grew to be retail with a large amount of office use in upper floors of large buildings. In the latter part of the 1900s, aside from the few skyscrapers built, office, retail and entertainment uses dwindled and the popularity of downtown waned. As economic forces became more obviously cyclical (including recession and strong influence of interest rates), commercial development in downtown was replaced in large part by public investment. Since the last decades of the 20th century, tax incentives, with changes in federal legislation, state regulations and local ordinances have made reuse of long-vacant office buildings and their conversion to apartments and condominium use possible. The result of those factors has been a rebirth in downtown of a significant residential population, spurred by renewed interest in urban lifestyles and "loft-style" living.

Known Historical Resources within One-Quarter Mile of the Project

A search of the California Historical Resources Information System (CHRIS) was conducted for the PSA. In addition, a literature and archival records search for previously recorded historical resources and investigations within a one-quarter mile radius was performed. Tables 4-10 and 4-11 indicate the existence of at least two National Historic Landmarks, four National Register Districts, at least 76 to 78 separate National Register properties, 89 to 99 California Register properties, and 34 to 37 locally designated properties previously identified within the preferred project alternatives.

As indicated in Table 4-10, 21 known archaeological resources of unknown historical significance are located within one quarter-mile of the PSA proposed build alternatives. Twenty-one archaeological resources have been previously recorded within one-quarter mile of the At-Grade Emphasis LRT Alternative. Eleven of these sites are also within one-quarter mile of Underground Emphasis LRT Alternative (Table 4-10). A majority of the archaeological sites were identified by archaeological monitoring of construction activities related to recent construction projects. Most of these sites that have been encountered during ground disturbances contain historic period building or structure foundations or construction materials, and/or historic refuse deposits. One isolated prehistoric burial was encountered at considerable depth during trenching. The burial was found eleven feet below the ground surface, consisting of nine feet of overburden and 2 feet of natural stratigraphy. No archaeological properties listed in the National Register, Archaeological Determinations of Eligibility, or Historic Property Data File are located within one-quarter mile of the PSA.

A Native American cemetery (CA-LAN-1575/H) was encountered during construction-related ground disturbances on Alameda St. next to Union Station in the immediate vicinity of the Pueblo of Los Angeles. In addition, a single Native American burial was recorded near the intersection of Temple and Hill Streets during construction-related ground disturbances.

A review of historic literature indicates that the City's original water system, built in 1781 during the Spanish Period, crosses the PSA. The original water system consisted of the main ditch, the Zanja Madre, and several branch ditches that flowed south and southwest into the city and beyond. A circa 1880 map of the Zanja system indicates that the Zanja Madre, and Zanja Numbers three, four, five, and nine cross the northeastern portion of the PSA. In addition, the Woolen Mill Ditch and the West Branch Zanja Number 8R, cross the two build alternative alignments in the southwestern portion of the PSA.

The results of the records search and literature review indicate that the build alternatives are located in areas that are highly sensitive for buried archaeological resources from both prehistoric and historic time periods.

While specific conclusions regarding project-related effects to these historic properties and identification of all previously unevaluated properties cannot be made at this level of project development, it must be noted that future project development should be coordinated with a consulting, qualified architectural historian and qualified archaeologist, in order to identify all previously unevaluated properties and evaluate project effects.

Detailed plans of the project will be necessary to conduct the next environmental review steps (e.g., identification and analysis of impacts). Table 4-12 through Table 4-14 present preliminary identification of archaeological resources in the PSA.

Paleontological Resources

The PSA is situated in the southwestern block of the Los Angeles basin. The Los Angeles basin is one of many basins comprising the Neogene continental borderland of southern California. It extends from the Santa Ana Mountains in the north to the San Joaquin Hills to the south, and includes the southern foothills of the San Gabriel Mountains, the Puente Hills, and the Palos Verdes Hills. The Los Angeles basin is a structural depression that has been the site of discontinuous deposition since the Late Cretaceous and of continuous subsidence and primarily marine deposition since the middle Miocene. This and other sedimentary basins formed during Miocene and Pliocene as a result of an early San Andreas-type phase of transform motion along the western margin of North America. According to geologic mapping and museum collections records, the PSA is immediately underlain by the following geologic units, from oldest to youngest: (1) Miocene Puente Formation, (2) Pliocene Fernando Formation, and (3) Quaternary alluvium. These geologic units, and their paleontological resource potential, are discussed in more detail below.

Puente Formation

The Puente Formation is middle to late Miocene (14 to 5 million years ago [Ma]) in age. The Puente Formation is known to produce significant paleontological resources including fossilized remains of sharks, fish, marine and terrestrial mammals, as well as some of the most complete collections of marine algae and terrestrial flora. It has been assigned a high paleontological resource sensitivity for its proven potential to yield scientifically significant fossil resources.

Fernando Formation

The Pliocene (5–1.8 Ma) age Fernando Formation is present in the eastern Puente Hills and much of the northeastern Los Angeles basin. In addition to numerous invertebrate fossils collected from the Fernando Formation, some marine vertebrate material has also been documented, including fossilized specimens of great white shark, dolphin, herring, hake, lanternfish, mackerel, swordfish, flounder, and whale. The presence of these fossils within this geologic unit, as well as it's proven potential to yield vertebrate remains in the vicinity of the PSA, has resulted in the designation of the Fernando Formation as having a high paleontological sensitivity.

Quaternary Alluvium

Quaternary alluvium of Holocene (10,000 years before present [BP] to Recent) age underlies much of the eastern portion of the PSA from approximately the intersection of 2nd and Hill Streets and eastward. Holocene-age deposits contain the remains of modern organisms and are generally too young to contain fossils. Fossil localities in older Quaternary alluvium deposits throughout southern California have yielded terrestrial vertebrates such as mammoths, mastodons, ground sloths, dire wolves, short-faced bears, saber-toothed cats, horses, camels, and bison. Fossilized invertebrates and plant remains have also been collected from this unit. Younger alluvium is determined to have a low potential for paleontological resources but is often underlain by older alluvium, which is determined to have a high potential for paleontological resources.

4.12.2 Evaluation Methodology

Information in this section is based primarily on the record searches and a reconnaissance-level field survey of the Area of Potential Effects[5] (APE) which included the area in the immediate vicinity of the PSA. Both historic and archaeological resources were considered during the survey. For the proposed alternatives, a paleontological collections records search was conducted by the Vertebrate Paleontology Section of the Natural History Museum of Los Angeles County (LACM). A detailed review of museum collections records was performed in order to identify any known vertebrate fossil localities within one mile of the proposed alternatives and to identify the geologic units within the PSA. In addition, published geologic maps were consulted.

[5] The study area, called Area Potential Effects (APE) in this report is a blanket one quarter-mile buffer from the proposed project alignments. The APE was not established in coordination with the California State Historic Preservation or in accordance with 36 *Code of Federal Regulations* (*CFR*) Part 800.16 (d). 36 *CFR* defines an APE as "the geographic area or areas within which an undertaking may directly or indirectly cause alterations in the character or use of historic properties, if any such properties exist. The area of potential effects is influenced by the scale and nature of an undertaking and may be different for different kinds of effects caused by the undertaking." Once project plans are developed to an appropriate level of detail, a project-specific APE will be developed for SHPO review and concurrence.

Table 4-12 Known Archaeological Resources within One-Quarter Mile of the PSA					
Primary Number	Trinomial	Other Designation	Resource Description	Recorded by/Date	Alignment(s)
19-000007	CA-LAN-7H	—	Los Angeles Chinatown dump area, mid 19th century	Meighan 1951	At-Grade & Underground
19-000887	CA-LAN-887H	Las Placitas	1880s Zanja Madre and structural remains from Spanish occupation through early 1900s	Costello 1978	At-Grade
19-001112	CA-LAN-1112H		Structural remains adjacent to Old Plaza Church dating to early 1800s	NARC 1981	At-Grade
19-001575	CA-LAN-1575/H		1860s-1930s Chinatown, Native American features and cemetery	Foster 1989, Horne 2000, Warren 2005	At-Grade
19-002791	CA-LAN-2791H	Pico-Garnier Block, El Pueblo de Los Angeles	Historic archaeological deposits present within the basement of the Merced Theater and the Garnier Building and beneath Sanchez Alley	Foster 1999	At-Grade
19-002928	CA-LAN-2928H	Brunswig Drug Co.	Historic gas tank, portions of a brick structure, miscellaneous iron pipes, the Brunswig Warehouse reinforced concrete foundations, and a small trash deposit	Hale 2001	At-Grade
19-003097*	CA-LAN-3097H		Mid to late 19th century privies and structural foundations	Warren 2003	At-Grade & Underground
19-003129	CA-LAN-3129H		Four historic refuse concentrations that date to the late 19th and early 20th centuries, may have been associated with the Modjeska Building that once occupied the area	Turner 2003	At-Grade & Underground
19-003169	CA-LAN-3169H		Two segments of the AT&SF railroad, turn of the century to early 20th century	Harris 2003	At-Grade
19-003337	CA-LAN-3337H		Oyster shell lens and historic glass, brick and stoneware fragments	Humphries 2000	At-Grade & Underground
19-003338	CA-LAN-3338H		Dense charcoal lens with associated historic artifacts	Humphries 2000	At-Grade & Underground
19-003339	CA-LAN-3339H		Historic trash lens with oyster shell, animal bones, glass, bricks, and stoneware, age unknown	Humphries 2000	At-Grade & Underground
19-003352	CA-LAN-3352H		Historic features including a segment of the Zanja No. 6-1, an artifact scatter, and a concrete foundation, dating to c. 1900	Foster 2005	At-Grade & Underground
19-003353	CA-LAN-3353H		Trash deposit with glass and ceramics, turn of the 20th century	Foster 2005	At-Grade & Underground

Table 4-12 Known Archaeological Resources within One-Quarter Mile of the PSA					
Primary Number	Trinomial	Other Designation	Resource Description	Recorded by/Date	Alignment(s)
19-003549	CA-LAN-3549H	El Pueblo de Los Angeles Winery	Adobe structure remnants and cistern filled with bottles, turn of the 20th century	Cordner 2006	At-Grade
19-003588	CA-LAN-3588H		Brick foundations and a historical artifact deposit	Foster 2006	At-Grade & Underground
19-003660	CA-LAN-3660H		Fragmented household refuse and building material debris associated with the occupation of a number of no longer extant buildings that existed from the 1890s onward	Hogan, Tan and Smallwood 2007	At-Grade & Underground
19-100301			Isolated black glass bottle fragment, dating to the late 19th Century	Michalsky 1998	At-Grade & Underground
19-100515		Republic Street Isolate	Historic artifact concentration with bricks, animal bone, metal, glass, ceramics, dating to 19th century	Slawson 2005	At-Grade
19-120014		Merced Theater	Pit feature containing historic artifacts	Eisentraut 1996	At-Grade
19-120015			Prehistoric human remains, no artifacts	Wlodarski 1978	At-Grade

4.12.3 Environmental Issues

Historical Resources

Significant built and archaeological resources have the potential to be impacted by both build alternatives to approximately the same extent. The following discussion of potential project-related environmental impacts provides an example of some issues that may apply to the proposed alternatives.

4.12.3.1 Construction

For any rail segments that require tunneling or cut-and-cover construction, an equation will be established to determine what the expected "settlement trough" for the proposed project will be. That settlement trough will show the distance from the proposed area of direct ground disturbance that additional project-related land deformation can be expected to occur. The establishment of a settlement trough is an important component of the effects analysis, which will be among the many factors taken into consideration in evaluating the proposed project. Effects from tunneling near historic buildings can include cracks and other damage resulting from differential settlement, tunnel-induced displacement and construction as well as operational vibration. A particularly challenging aspect of tunneling activities is that full effects of differential settlement on fragile buildings and other features may not be realized for years after construction activities have been completed.

For most elements of the project's construction phase, significant effects to historic properties are anticipated. Typical construction effects for this type of project are temporary loss of access and effects of vibration caused by use of heavy equipment and multiple equipment types simultaneously, as well as uneven earth movement (differential settlement) and uncontrolled dust that can damage buildings or other features, such as curbs, sidewalks and retaining walls. Standard construction control methods are recommended to control traffic, reduce noise, vibration and dust resulting from construction activities that will be associated with the proposed project. Vibration may be caused by use of tunneling and grading equipment, jackhammers and other heavy equipment, and by vehicle movement. It is recommended that vibration be monitored in areas of historic properties to limit its effects to below the Federal Transit Administration threshold for damage to fragile historic buildings. In addition, detailed pre-construction surveys of interiors and exteriors of each historic property should be conducted by qualified historical architects or engineers with specialized training and demonstrated experience in historic building reuse.

Although project plans have not been completed to sufficient detail to analyze these effects, it is expected that no historic properties would be demolished, relocated or acquired for the proposed project.

4.12.3.2 Operation

Visual impacts may result if the project introduced elements that were inconsistent with the visual character of the PSA, or if a project component, such as a station, were to obstruct important views or connections between buildings and features in settings or an historic district. Placement of catenary poles used to support at-grade train cross spans and catenary wires present the possibility for effects on historic properties. It is recommended that all catenary poles be placed immediately next to street curbs (within the public right of way), and that existing utility poles be replaced where feasible. Placement of catenary poles has yet to be determined and should be reviewed by cultural resources specialists to reduce effects. No proposed project catenary poles should be located within the boundaries of historic properties or historic districts. As discussed in Section 4.3.1.5,, catenary poles for the proposed project should in some cases replace existing utility poles. This type of replacement may reduce visual clutter in the vicinity of historic resources near the proposed project. Because of support requirements of catenary wires, particularly at curves and corners, there is the potential for an overhead "spider web effect" to result, where numerous wires and stays result in increased visual clutter.

For this project, obstruction or impeded views (toward or from the resources), and their respective settings may result from the placement of catenary poles and wires. A project option may involve using cross span wires that would be anchored to the street facades of buildings to support catenary wires, particularly at street corners. This "eyelet" method was a common technique used to support wires for historic trolley systems. There is a possibility that such eyelets would be proposed to be affixed to historic buildings, which could have a potential significant impact on historic resources.

Both of the build alternatives call for a vehicular underpass and pedestrian overpass to be constructed on Alameda St., either at Temple St. (At-Grade Emphasis LRT Alternative) or 1st St. (Underground Emphasis LRT Alternative). The overpass/underpass structure will interrupt lines of sight along both streets at the intersection where constructed and may conflict with the historic appearance of the neighborhood, especially on 1st St.

Additional project-related effects on historical resources include potential impacts from excavation-induced ground settlement and other ground-movement-related building damage. Each of these could affect fragile historic properties, resulting in adverse effects. Additionally, effects of new station construction and the introduction of catenary wires and poles in historic districts or adjacent to historic properties could each result in changes in settings, and thus in adverse effects.

4.12.3.3 Paleontological Resources

According to geologic mapping and museum collection records, the build alternatives are underlain by the paleontologically sensitive Puente Formation, Fernando Formation, and Quaternary older alluvium. Museum collections records maintained by the Natural History Museum of Los Angeles County (LACM) were searched and four previously recorded vertebrate fossil localities were discovered either along the proposed alternative routes or within a one-mile radius (Table 4-13). In addition, the records search revealed

that at least eleven vertebrate fossil localities have been previously documented in the general vicinity of the PSA and were discovered within the same geologic units that are present within the proposed alternative alignments (Table 4-14).

The potential for adverse impacts to paleontological resources would be greater during the construction of the Underground Emphasis LRT Alternative, as this alternative would require substantial excavations into paleontologically sensitive geologic units. Digging for the automobile underpass on Alameda St. at either Temple St. or 1st St. will have similar effects. However, both build alternatives traverse paleontologically sensitive units and have the potential to impact paleontological resources. Implementation of proper mitigation measures can, however, reduce the impacts to paleontological resources to a less than significant level.

Table 4-13 Paleontological Localities Located within a One-Mile Radius of the Build Alternatives

LACM Locality Number (s) and Approximate Location	Geologic Formation	Age	Taxa
LACM 6971; 6th and Flower Streets; LACM 4726; 4th and Hill Streets	Fernando Formation	Pliocene	Myliobatis (eagle ray), Carcharodon carcharias (white shark), Isurus oxyrinchus (bonito shark), Carcharhinus (requiem shark), Semicossyphus (sheepshead)
LACM 5961; 1st and Hill Streets	Puente Formation	Late Miocene	Cyclothone (bristlemouth fish)
LACM 3868; Wilshire Blvd. and Lucas Ave.	Fernando Formation	Pliocene	Carcharodon sulcidens (white shark)

Table 4-14 Paleontological Localities Located in the Vicinity of the Build Alternatives

LACM Locality Number (s) and Approximate Location	Geologic Formation	Age	Taxa
LACM 6198- 6203; Wilshire Blvd. from intersection of Alvarado St. west to past Vermont Ave.	Puente Formation	Late Miocene	Osteichthyes (bony fish), Cetacea (whale)
LACM 3250; east of Vermont Ave. near Madison Ave. and Middlebury St.	Quaternary alluvium	Pleistocene	Mammuthus (fossil mammoth)
LACM 5845; Western Ave. and Beverly Blvd.	Quaternary alluvium	Pleistocene	Mammutidae (fossil mastodon)

4.13 Parklands and Other Community Facilities

Public transit service increases the accessibility of parklands and community facilities within the area, thereby providing a benefit to the community. However, the establishment of a new transit system has the potential for adverse direct impacts resulting from the need for physical acquisition, displacement or relocation of parkland or a community facility. Adverse indirect impacts may involve changes to roadways and public right-of-ways that reduce pedestrian or vehicular access to facilities.

Other potential indirect or secondary impacts on parklands and community facilities such as impacts to pedestrian safety, air quality, and noise are discussed in Sections 4-15, 4-6 and 4-7, respectively.

4.13.1 Affected Environment

4.13.1.1 Regulatory Framework

Public parklands, significant cultural resources, and natural wildlife refuges are given protection under Section 4(f) of the U.S. Department of Transportation Act of 1966. Direct use (i.e. encroachment or acquisition) of Section 4(f) lands by federally funded transportation projects is prohibited unless it can be demonstrated that no prudent alternatives are available. If no prudent alternatives exist, the effects must be reduced through project design and mitigation measures. Indirect effects to Section4(f) lands may involve obstruction or alteration of access, introduction of significant noise or vibration sources, casting of shadows, or other substantive changes to the visual setting.

4.13.1.2 Existing Conditions

There are currently four emergency facilities (three fire stations and one police station) located within one-quarter mile of both alignment alternatives. Additional community facilities (museums, performing arts centers, religious facilities, and schools) within one-quarter mile of both alignments include:

- California Academy for Liberal Studies Early College High School (700 Wilshire Blvd., 4th Floor)
- Los Angeles Downtown Public Library (630 W. 5th St.)
- Los Angeles Downtown Public Library Park (630 W. 5th St.)
- Pershing Square (532 South Olive St.)
- MOCA Museum of Contemporary Art (MOCA) - Grand Ave.
- The Colburn School of Music and Performing Arts (200 S Grand Ave.)
- The Disney Concert Hall
- The Dorothy Chandler Pavilion

- City Hall Park (200 N Spring St.)
- Fletcher Bowron Square (300 block of N. Main St.)
- Union Center for the Arts (120 North San Pedro St.)
- Little Tokyo Library (203 S Los Angeles St.)
- Japanese American National Museum (369 East 1st St.)
- James Irvine Garden (244 S. San Pedro St.)
- Japanese American Cultural and Community Center (244 S. San Pedro St.)
- The Geffen Contemporary at MOCA (152 North Central Ave.)
- El Pueblo de Los Angeles State Historical Monument (500 block of N. Main St.)
- Higashi Honganji Buddhist Temple (505 East 3rd St.)
- Koyasan Buddhist Temple (342 East 1st St.)
- Union Church of Los Angeles (401 East 3rd St.)

Of these resources within one-quarter mile from the alignment, the greatest potential direct or indirect impacts would be to the resources located adjacent to an alignment and in the vicinity of the stations.

Parklands and community facilities adjacent to the At-Grade Emphasis LRT Alternative alignment are listed below. Any differences between Options A and B are noted.

- Los Angeles Central Library Building and Park – located on 5th St. to the east of Flower St. The alignment runs below-grade to the west of the site on Flower St. A station is located to the west of the library site (Option A).
- MOCA Museum of Contemporary Art (MOCA) – located near the southeast corner of 2nd St. and Grand Ave. The alignment runs at-grade along 2nd St. to the north.
- The Colburn School of Music and Performing Arts - located at the southeast corner of 2nd St. and Grand Ave. The alignment is below-grade to the north of the site, and transitions to at-grade at Main St. to the east.
- Disney Concert Hall – located on 2nd St. between Grand Ave. and Hope St. The alignment is below-grade to the south of the site, and transitions to at-grade at Grand Ave. to the east. A station is located to the southwest.
- City Hall Park – located on the City Hall grounds at the northwest corner of 1st and Main Streets. The northbound alignment runs at-grade along Main St. to the east.

There is a station at this location on Main St. The station would be a side platform located on the east side of the street, opposite the park.

- Fletcher Brown Square – Los Angeles Mall - located in the 300 block of Main St. between Temple and Aiso Streets. The alignment is at-grade to the south of the site along Temple St. A pedestrian overcrossing spans 2nd St., linking Fletcher Brown Square to the Civic Center.

- Little Tokyo Library – located at the southwest corner of 2nd and Los Angeles Streets. The alignment runs at-grade along 2nd St. and turns north onto Los Angeles St. There is an optional station located to the northwest of the site.

- The Geffen Contemporary at MOCA – located near the southwest corner of Temple and Alameda Streets. The alignment runs along Temple St. to the north and turns south on Alameda St. where in connects to the Gold Line. The Little Tokyo/Arts District Station is located on Alameda St. immediately to the east of the site.

Parklands and community facilities potentially impacted by the Underground Emphasis LRT Alternative alignment and station locations are listed below. Unless otherwise noted, the alignment and stations are below-grade:

- Los Angeles Central Library Building and Park – located on 5th St. to the east of Flower St. The alignment runs to the west of the site on Flower St. A station is located to the north of the library site.

- MOCA Museum of Contemporary Art (MOCA) – located near the southeast corner of 2nd St. and Grand Ave. The alignment runs at-grade along 2nd St. to the north.

- The Colburn School of Music and Performing Arts - located at the southeast corner of 2nd St. and Grand Ave. The alignment is to the north of the site.

- Disney Concert Hall – located on 2nd St. between Grand Ave. and Hope St. The alignment is to the south of the site. A station is located to the southwest.

- Little Tokyo Library – located at the southwest corner of 2nd and Los Angeles Streets. The alignment runs along 2nd St. to the north. A station is located adjacent to the site.

- Japanese American National Museum – located near the northwest corner of 1st and Alameda Streets. The alignment transitions from below-grade to at-grade to the south of the site and extends at-grade to the east along Alameda St., where it connects to the Little Tokyo/Arts District Station.

- The Geffen Contemporary at MOCA – located near the southwest corner of Temple and Alameda Streets, to the north of the Japanese American Nation Museum. The alignment terminates immediately to the south of the site at Little Tokyo/Arts District Station.

4.13.2 Evaluation Methodology

The evaluation of potential impacts on parklands and community facilities involves determining what facilities are located near the proposed alignments and if the alignments would directly impact any of the facilities through encroachment or acquisition, or indirectly impact the facilities by limiting access.

The information regarding parklands and community facilities was found through Navigate LA, a City of Los Angeles Bureau of Engineering web-based mapping application which identifies all types of community facilities within City boundaries.

4.13.3 Environmental Issues

Public transit serves to increase the accessibility to parklands and community facilities within the PSA. Potential direct impacts on parklands and other community facilities would arise from the need for physical acquisition, displacement or relocation of parkland or a community facility. Indirect impacts involve changes to pedestrian or vehicular access. Direct impacts would only occur at facilities located adjacent to the alignments and stations. Similarly, indirect impacts would be most likely to occur at facilities adjacent to or in closest proximity to the alignments.

Construction of either build alternative would primarily occur within existing streets and public rights-of-way, and/or underground which would limit the needs for direct acquisition of parkland or other community facilities. However, some direct acquisition would be required for at-grade alignments when street widths are narrow or where additional width is needed to accommodate turns and curves. Acquisition is also required for underground alignments at underground station locations to accommodate station access portals. As such, the At-Grade Emphasis LRT Alternative would require less property acquisition than the Underground Emphasis LRT Alternative. However, both the At-Grade Emphasis LRT Alternative, Option A and the Underground Emphasis LRT Alternative have potential property acquisition associated with providing portal locations in the vicinity of the Central Library. The Underground Emphasis LRT Alternative may also require acquisition for portals in the vicinity of the Little Tokyo Branch Library and the Japanese American National Museum. Further evaluation would be needed to determine potential direct impacts associated with property acquisitions.

Reduction in vehicle or pedestrian access to parkland and community facilities, or an unacceptable reduction in emergency services response time related to roadway modifications would be potential adverse impacts. While each alternative could reduce access during the construction period, the operation of the At-Grade Emphasis LRT Alternative would have greater potential impact on access than the Underground Emphasis LRT Alternative. Roadway modifications associated with the At-Grade Emphasis LRT Alternative may include reductions in the number of traffic lanes, removal or modification of existing left turn pockets, and impacts on existing driveways. Reductions in roadway capacity and changes in traffic configuration could reduce access to parkland or communities facilities in the immediate vicinity. Conflicts related to emergency service access could also result. Adequate review will need to be conducted in order to assure the maintenance of acceptable levels of ingress/egress and emergency

response access for police and fire stations and adequate public access to parklands and community facilities.

Access to parklands and community facilities could be further impacted by loss of currently available street parking. The At-Grade Emphasis LRT Alternative would result in the loss of approximately 88 on-street parking spaces, as compared to approximately 20 spaces for the Underground Emphasis LRT Alternative. Further evaluation would be required to determine if this loss of parking would adversely affect the public's ability to access parklands and community facilities, and if so, if alternative parking could be provide elsewhere.

Reduction in pedestrian access to parklands and community facilities would also be a potentially adverse impact.

The Underground Emphasis LRT Alternative would have greater potential direct impacts on parklands and community facilities related to the need for direct acquisition for portals to underground stations. The At-Grade Emphasis LRT Alternative would have greater potential indirect impacts on parklands and communities facilities as a result of needed roadway modifications to accommodate the alignment, which could potentially reduce parking for and access to parklands and community facilities.

Both alternatives would reduce access to parklands and communities facilities during the construction phase. Given the intensity of construction associated with underground transit development, construction impacts related to the Underground Emphasis LRT Alternative may be greater than with the At-Grade Emphasis LRT Alternative.

4.14 Economic & Fiscal Impacts

The PSA is at the heart of the downtown Los Angeles resurgence. With more than 12,000 households and close to 200,000 employment opportunities projected for the year 2030, a more comprehensive transportation system is becoming an economic necessity. While there is the potential for the project to impact the current environment, it is important to consider the positive impacts construction would have on the local and regional economy including employment, construction spending, and indirect spending as well. This section will survey the economic and fiscal impacts of the Regional Connector on the regional economy, including the following:

- Tax revenue impacts
- Construction-Related Economic Impacts
- Construction-Related Employment
- Construction Spending on the Regional Economy

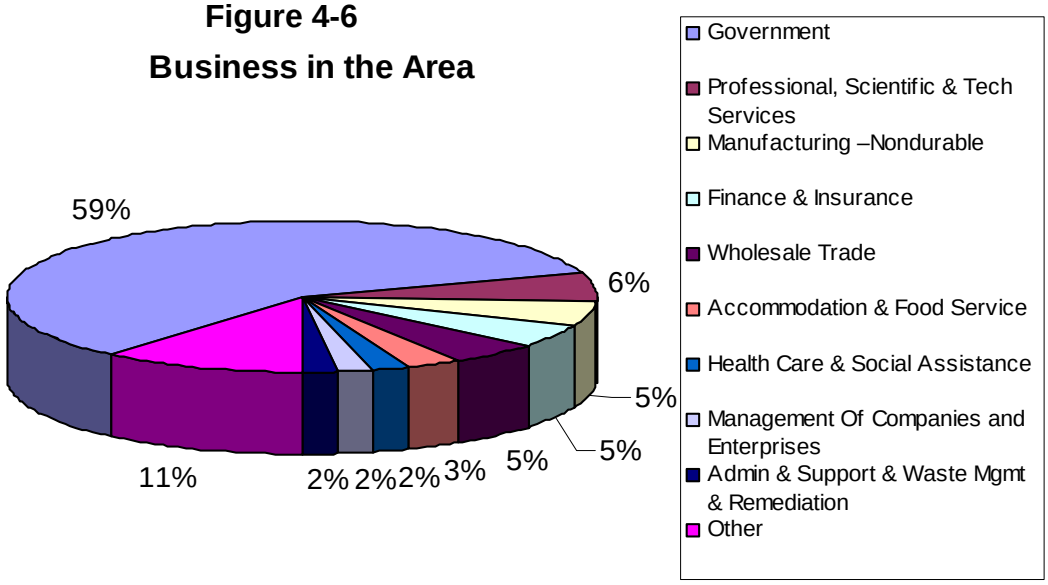
4.14.1 Affected Environment

4.14.1.1 Existing Conditions

The PSA, located within the Central City region, consists primarily of high-density commercial and industrial uses. Within this region, many of the traditional commercial areas are being transformed into medium to high density multi-family residential units and mixed use developments.

Figure 4-6

Business in the Area



A mixture of light and heavy industrial land uses exists along the eastern half of the Central City, east of Main St., and adjacent to the Alameda District. The remaining land uses within the downtown area are designated for public facilities and open space. Figure 4-6 gives a more detailed breakdown of the type of businesses in the PSA.

The PSA makes up approximately 0.03 percent of the 4,752 square miles of Los Angeles County. Although small in size, the PSA is a densely populated employment center comprised of mostly government jobs. The two build alternatives travel through the Civic Center and along Temple St., providing access to the majority of these employment opportunities. There were approximately 168,000 employees in the PSA in 2005, which is expected to increase to over 188,000 in 2030. Current projected employment within the PSA is between three and four percent of total Los Angeles County employment. Employment density in the PSA was 110,529 employees per square mile, which was significantly higher than the employment density of 977 for the County as a whole. The tax revenue base in the PSA is approximately $85.9 million[6].

In 2005 the total population of the PSA was 17,795 people, which was only 0.18 percent of the Los Angeles County population of over ten million. PSA population is expected to grow to 21,000 people in 2030.

[6] 2000 Census Data; Los Angeles County Assessor

There were 9,673 households in the PSA in 2005 with a median household income of approximately $45,000. Group quarters added an additional 5,466 residences. Total households are projected to increase 26.1 percent from about 9,700 in 2005 to 12,200 in 2030, which is higher than the 24.8 percent projected growth for Los Angeles County as a whole.

4.14.2 Evaluation Methodology

General assumptions are based upon available existing data from various sources, and verified by windshield survey. Information sources include the SCAG, American Public Transit Association, County Assessors Records, and Damar.

For the purposes of this evaluation, tax revenue losses were estimated using available information from the Los Angeles County Assessor's Office. The Assessor's Parcel Number, land value, improvement value, square footage, 2007 tax payments, and owner's information were identified for all affected parcels of land. Using this information, the per square foot land value and the corresponding 2007 land tax payment made on each square foot were estimated. These estimates were used together to determine loss in tax revenue due strictly to land acquisition.

Potential construction-related impacts were determined using conceptual site maps and station design plans. This information was used to identify potentially affected businesses in the area.

4.14.3 Environmental Issues

4.14.3.1 Tax Revenue Impacts

The two build alternatives effectively use the public right of way for track construction and station sites, minimizing the need for land acquisition. However, as discussed below, some acquisition is required for each alternative.

At-Grade Emphasis LRT Alternative

According to preliminary station and alignment design, the stations will need an area approximately five feet deep along the street frontage for the length of the station for construction. Total tax revenue loss due to land acquisition for these alternatives is estimated at $71,802.61 (see Table 4-15). This is approximately 0.084 percent of the $85,929,841.00 tax revenue base of the PSA. As such, tax revenue loss is not anticipated to be a significant impact for this alternative.

Underground Emphasis LRT Alternative

Since the station sites and design for the Underground Emphasis LRT Alternative have not been finalized, the land acquisition requirements for this alternative considered herein are limited to the proposed construction staging area near Alameda St. Total tax revenue loss due to land acquisition for this alternative is estimated at $163,130.29 (see Table 4-16). As this is approximately 0.190 percent of the $85,929,841.00 tax revenue base of the PSA, tax revenue loss is not anticipated to be a significant impact for this alternative.

Table 4-15 Estimated Loss of Tax Revenue Due to Land Acquisition
At-Grade Emphasis LRT Alternative

Assessor's Parcel #	Address	Property Type	Land Sq.Ft	Land Value	Sq. Ft.	Improvement Value	2007 Tax Payment	Ownership	TAX REVENUE LOSS
South of LA Times									
5149-008-032	201 S. Spring St. LA, CA 90012	Commercial/Industrial	25898	$1,927,273	195	$5,735.00	$35,709.70	LA Times Communications LLC	$1,847.55

4.14.3.2 Construction-Related Economic Impacts

- Construction-related impacts are likely to occur throughout the PSA, and will increase in severity near the proposed station sites, as construction activity would be concentration at these locations. Further, closure of sidewalks would impede circulation in the area immediately surrounding construction areas and impact access to adjacent land uses. Although the alignment is located mainly within the public right-of-way, the nature of the proposed project and the land use characteristics of the PSA will inherently lead to adverse affects for businesses, inhabitants and industry within close proximity. The businesses that will be most directly affected by construction are at-grade store fronts that cater to pedestrian foot traffic.

- The following are some of the potential PSA construction impacts:

  - Traffic disruption
  - Increased noise, vibration and dust
  - Modified vehicular and pedestrian traffic patterns
  - Modified parking areas
  - Utility disruptions
  - Reduction in business access/visibility of signs and businesses
  - General disinterest in area businesses due to construction

At this time it is assumed that the project will be fully implemented by 2018. Depending on the phasing schedule, the PSA will be affected by construction at different intervals throughout the ten year period.

For this analysis, the PSA was divided into four distinct sections.

A. Civic Center:

Downtown Los Angeles is predominately occupied by government offices and government employees. The majority of these employment opportunities are concentrated within the Civic Center area. For the purposes of this analysis the Civic Center area is considered Temple St. between Main St. and Alameda St., and Los Angeles St. and Main St. between Temple St. and 2nd St. Within these boundaries, City Hall, City Hall East, the Caltrans Building, VA Hospital, Los Angeles Police Department Headquarters, Federal building, and Courthouse are located.

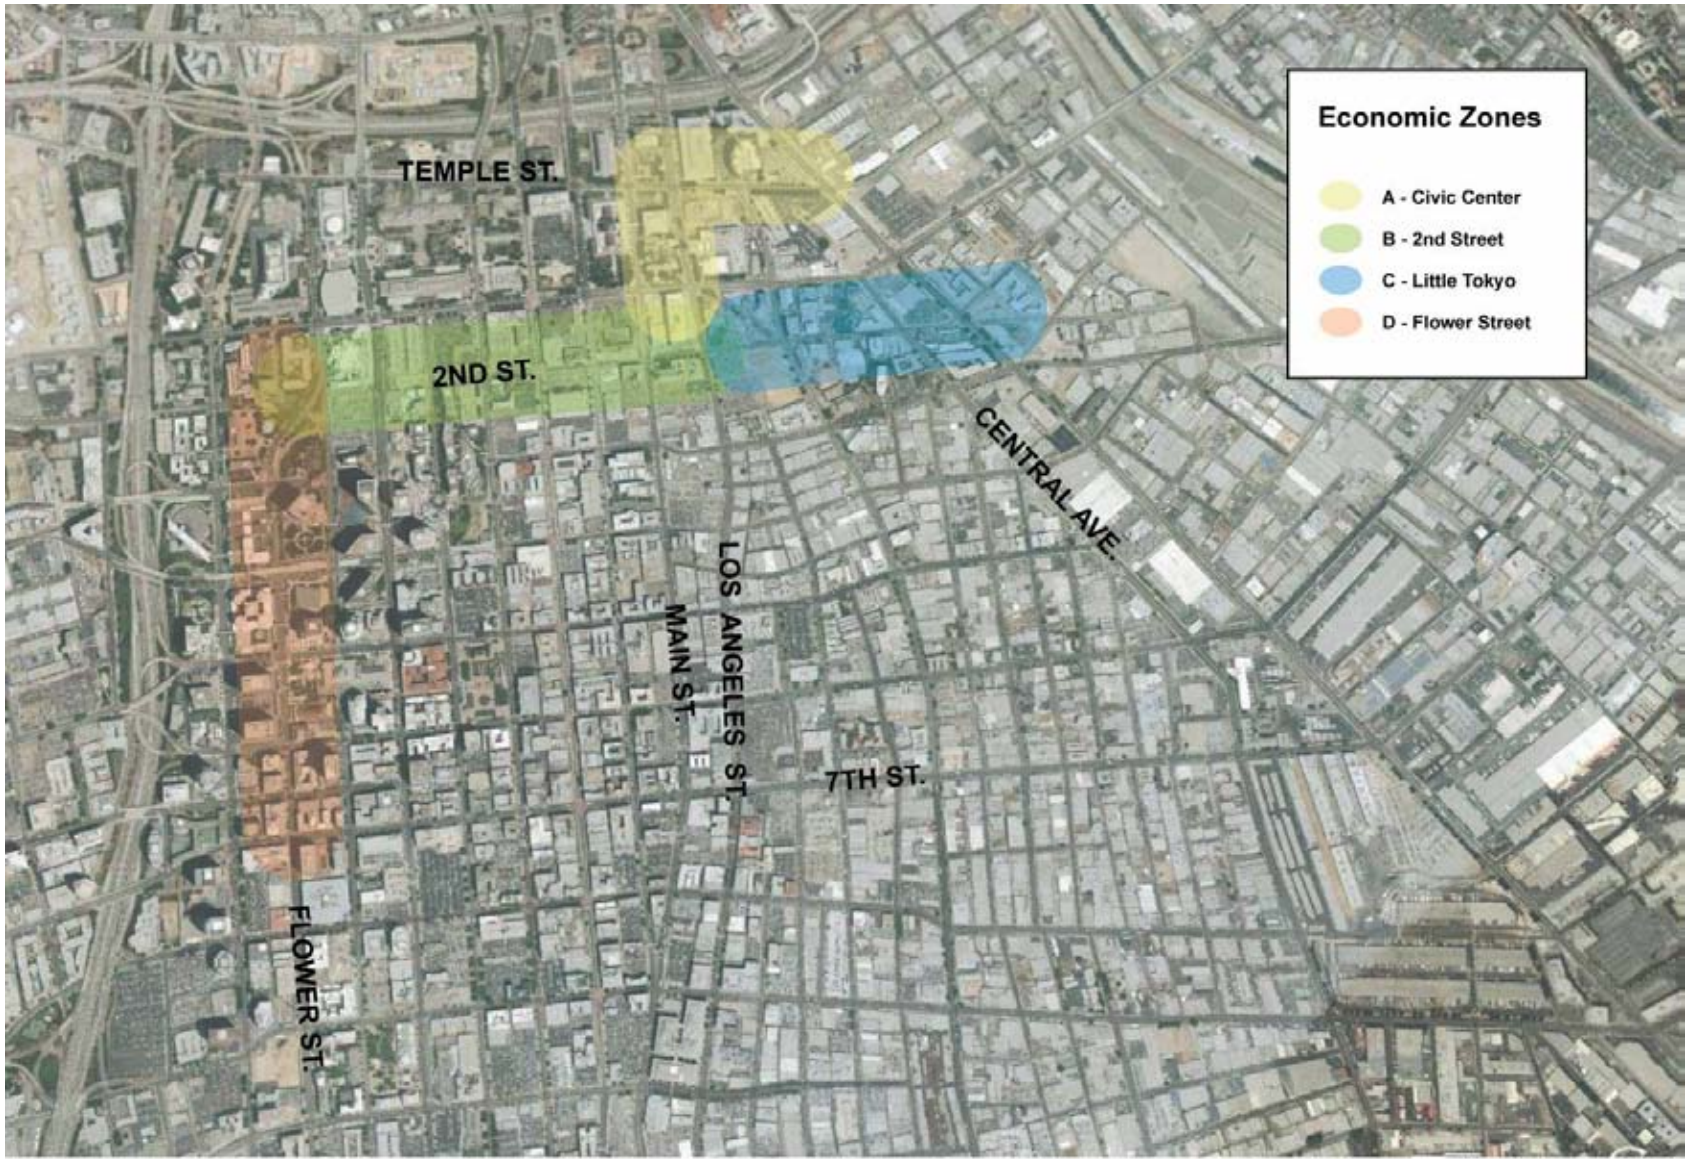

Figure 4-7 Economic Zone Map

B. 2nd St:

The land uses in the area 2nd St. between Los Angeles and Flower Streets is comprised of commercial space, including retail and office buildings, as well as minimal high-density residential. 2nd St. between Broadway and Figueroa Ave. goes through a tunnel that runs underneath Bunker Hill. The segment of 2nd St. through the tunnel is two lanes in each direction.

C. Little Tokyo:

2nd St. between Los Angeles and Alameda Streets runs through the heart of Little Tokyo. The street is lined with ethnic eateries, Japanese markets, and retail stores.

D. Flower St:

Flower St. between 3rd St. and Wilshire Blvd. runs through the heart of downtown. The street is lined with hotels, street level retail space, and medium to high density multi-family residential units.

The following sections will analyze the potential construction-related effects of the two build alternatives and identify the specific businesses impacted. Options A and B of the At-Grade Emphasis LRT Alternative use the same alignment in the majority of the PSA, therefore their analysis will be combined in regards to the Civic Center, 2nd St., and Little Tokyo economic zones. The differences between the two will be made clear in the discussion of the Flower St. economic zone.

At-Grade Emphasis LRT Alternative

A. Civic Center

In this segment of the PSA, Option A provides for at-grade track construction with a dual track configuration for the majority of the section, and single track configuration on Main St. and Los Angeles St. between 2nd and Temple Streets. The alternative also proposes two stations in the Civic Center area: 1) a southbound station on Los Angeles St. between Temple and 1st Streets, and 2) a northbound station on Main St.

The LRT track is located primarily within the public right-of-way, thereby limiting land acquisition and the need for pedestrian walkway closures during construction. Depending on final design, technology, and construction techniques employed, there will need to be phased street closure to complete the track construction. Traffic disruption will decrease access to the businesses in the area; however, the government entities located within the Civic Center do not depend on pedestrian or automobile traffic to generate revenue, decreasing the severity of the economic impacts. As traffic disruption will make it difficult for employees to access their offices, mitigating measures will be implemented to alleviate these impacts.

The proposed at-grade stations will require pedestrian walk-way closures, causing more severe construction impacts within the proximity of proposed station locations. The proposed station sites are on Main St. and Los Angeles St. between 1st and Temple Streets. There will also be pedestrian and roadway detours at the intersection of Temple St. and Alameda St. for the construction of the automobile underpass and pedestrian

overpass. As mentioned above, the businesses in the area predominantly engage in government activity and do not rely on traffic to generate customers. Table 4-17 below gives a detailed breakdown of the businesses in the area that will be temporarily affected by the construction of the station sites.

Table 4-17 Businesses Potentially Affected During Period of LRT Track Construction

Civic Center	
Geffen Contemporary	The main parking area for the museum is located on Temple St. Construction would cause decreased use of the parking lot and loss of parking revenue. It would also lead to parking difficulties for Geffen Contemporary patrons, which in-turn could reduce patronage. The main entrance for the museum is located on 1st St., which would receive less noise, dust and vibration effects from construction than the parking area.
LA Mall Entrance	The LA Mall located on the Corner of Temple St. and Los Angeles St. would be affected by track construction. The entrance located on Main St. is within the proximity of the proposed northbound station in this area. The construction impacts will decrease access to the mall adversely affecting the businesses located in the Mall.
New Otani Hotel	The New Otani Hotel located on Los Angeles St. between 1st and 2nd Streets would be affected by at-grade construction of the LRT track on Los Angeles St. and 2nd St. As the main rntrance to the hotel lobby as well as the parking structure are located on Los Angeles St., construction effects would be potentially significant. The decreased access to the hotel, noise and vibration, decreased visibility of signs, and a general disinterest in the area due to construction would have adverse effects on the hotel's business.
Starbucks	Starbucks Coffee located at the corner of 1st and Los Angeles Streets would be affected by at-grade construction of the LRT track on Los Angeles St. The decreased access to Starbucks, noise and vibration, decreased visibility of signs, and a general disinterest in the area due to construction could adversely affect Starbucks. However, the coffee shop can be accessed from 1st St., reducing the effects.
Azalea Restaurant	Azalea Restaurant located at the corner of 1st and Los Angeles Streets would be affected by construction. The decreased access to the restaurant, noise and vibration, decreased visibility of signs, and a general disinterest in the area due to construction will adversely affect the Azalea Restaurant.

B. 2nd St.

This segment of the alignment is a continuation of the at-grade track construction. The alternative does not currently call for stations on 2nd St. in this area. Once station locations have been finalized, further analysis will be required.

Within the boundaries of the PSA, a portion of 2nd St. runs through a tunnel underneath Bunker Hill. The tunnel will likely be shut down during track construction, causing traffic disturbances on 2nd St. and the overall PSA. However, running the tracks through the tunnel lessens direct impacts to businesses during construction.

Construction will directly impact the businesses that are located on 2nd St. between Los Angeles and Hill Streets. The new LAPD headquarters and the south side of the Los Angeles Times office buildings are located along 2nd St. Construction impacts will be more of an issue in this area only because the retail businesses along 2nd St., including Pitfire Pizza, China Bistro, and the Kawada Hotel, depend on traffic for revenue generation. Table 4-18 provides a list of businesses in the area that will potentially be affected by the at-grade track and station construction.

C. Little Tokyo

The At-Grade Emphasis LRT Alternative bypasses the Little Tokyo district, protecting the cultural center from the construction impacts of at-grade track and station construction.

D. Flower Street

The At-Grade Emphasis LRT Alternative uses a combination of at-grade and underground double track configuration to reach the 7th St./Metro Center Station and connect to the existing Metro Blue Line. In the rest of the PSA the Option A and Option B routes are identical, but in the Flower St. segment they have slight differences, as explained below.

Option A

The track would be located underground from the 2nd St. tunnel to Flower St., making a brief appearance above-ground before 3rd St. and then returning back underground after 3rd St. all the way to the 7th St./Metro Center Station. The alternative also calls for two underground stations, between Hope and Flower Streets and on Flower St. between 5th and 6th Streets.

Option B

The track would be located at-grade until it crosses 3rd St. before going back underground, with an at-grade station between 3rd and 4th Streets.

Unlike the at-grade track construction, the underground segment of the alternatives would result in fewer economic impacts. During construction, phased street closure will likely be implemented; however, depending on the tunneling technique used and location of exhaust vents there will be less traffic disruptions. Construction effects that would disrupt business activities, including noise, vibration, dust, decreased view of signage and overall disinterest in the area, will be limited strictly to station sites, which would employ cut and cover construction. This type of construction will cause sidewalk and street closures in the station locations, creating more severe impacts for businesses located within close proximity. See Table 4-19 for a detailed breakdown of the affected businesses.

Underground Emphasis LRT Alternative

The construction of the Underground Emphasis LRT Alternative will cause minimal adverse economic impacts in the PSA. Depending on the tunneling and construction techniques used to construct the tunnel, there may be a need for phased street closure, however the effects will not be as severe as at-grade track construction. Boring of the tunnel might also cause noise and vibration, but it will not be severe enough to impact business and inhabitants in the area.

Table 4-18 Businesses Potentially Affected During Period of LRT Track Construction	
2nd Street	
Pitfire Pizza	Located at the corner of 2nd St. and Main St., Pitfire Pizza will be affected by construction of the track and possible at-grade station. According to the preliminary design and land acquisition studies, a portion of the pedestrian walkway will be impeded to construct the station, eliminating pedestrian access to the restaurant from 2nd St. for the duration of the track and station construction. The main entrance to the restaurant is located at the corner of 2nd St. and Main St. allowing access to the restaurant from 3rd St. and alleviating some of the access issues. The at-grade station will require a more intensive construction effort than the track, and potentially cause increased noise, vibration, particulate matter, decreased view of the signage, and a general disinterest in the area due to construction.
China Bistro	Located at the corner of 2nd St. and Main St., China Bistro will be affected by construction of the track and at-grade station. According to the preliminary design and land acquisition studies, a portion of the pedestrian walkway will be impeded to construct the station, eliminating pedestrian access to the restaurant from 2nd St. for the duration of the track and station construction. The at-grade station will require a more intensive construction effort than the track, potentially causing increased noise, vibration, particulate matter, decreased view of the signage, and a general disinterest in the area due to construction.
Edison Bar	Located at the corner of 2nd St. and Main St., Edison Bar will be affected by construction of the LRT track and at-grade station. According to the preliminary design and land acquisition studies, a portion of the pedestrian walkway will be impeded to construct the station, eliminating pedestrian access to the restaurant from 2nd St. for the duration of the track and station construction. The main entrance to the bar is located in an alley between 2nd St. and 3rd St., alleviating some of the access issues on 2nd St. The at-grade station will require a more intensive construction effort than the track, causing increased noise, vibration, particulate matter, decreased view of the signage, and a general disinterest in the area due to construction.
Ground Worx Coffee	Located on Main St. between 2nd St. and 3rd St., Ground Worx Coffee will be affected by construction of the LRT track and at-grade station on 2nd St. According to the preliminary design and land acquisition studies, a portion of the pedestrian walkway on 2nd St. will be impeded to construct the station, eliminating pedestrian access to the coffee shop from 2nd St. for the duration of the track and station construction. Access to the coffee shop will be limited to 3rd St. The at-grade station will require a more intensive construction effort than the track, causing increased noise, vibration, particulate matter, decreased view of the signage, and a general disinterest in the area due to construction.
Cigars	Located at the corner of 2nd St. and Spring St., Cigars will be affected by construction of the LRT track and at-grade station. According to the preliminary design and land acquisition studies, a portion of the pedestrian walkway will be impeded to construct the station eliminating pedestrian access to the shop from 2nd St. for the duration of the track and station construction. The at-grade station will require a more intensive construction effort than the track, causing increased noise, vibration, particulate matter, decreased view of the signage, and a general disinterest in the area due to construction.
Kawada Hotel	Located at the corner of 2nd St. and Broadway, the Kawada hotel will be affected by track construction on 2nd St. Decreased access, noise, vibration, and dust will decrease the overall attractiveness of the hotel, making increased vacancy rates a likelihood.

Table 4-18 Businesses Potentially Affected During Period of Track Construction	
Flower Street	
World Trade Center Parking	The World Trade Center parking lot, located near the corner of 3rd St. and Flower Streets, will have decreased access due to construction and possible street closure. The parking lot does have alternate access on Figueroa St., alleviating some of the impact.
Bank of America Plaza Parking	The Bank of America Plaza parking lot located near the corner of 3rd St. and Flower St. will experience decreased access due to construction and possible street closure. The parking lot does have alternate access from Bunker Hill, alleviating some of the impact.
400 S. Flower Parking	The parking lot located at 400 S. Flower St. will experience decreased access due to construction and possible street closure.
City National Plaza Parking	The City National Plaza parking lot located near the corner of 4th St. and Flower St. will experience decreased access due to construction and possible street closure.
Westin Bonaventure	The entrance to the Westin Bonaventure is located on Flower St. at the corner of 4th St. and Flower St. The track construction would decrease access to the hotel from Flower St., and construction impacts could decrease overall appeal of the hotel entrance from Flower St. The Hotel does have an entrance from Figueroa St., alleviating the severity of this impact.
Miseki Restaurant	The entrance to Miseki Restaurant is located on Flower St. near the corner of 4th St. and Flower St. The track construction would decrease access to restaurant from Flower St., and construction impacts could decrease overall appeal of the restaurant. The restaurant does have access from the Westin Bonaventure Hotel, alleviating the severity of this impact.
Suede	The entrance to Suede Restaurant is located on Flower St. near the corner of 4th St. and Flower St. The track construction would decrease access to the restaurant from Flower St., and construction impacts could decrease overall appeal of the restaurant. The restaurant does have access from the Westin Bonaventure Hotel, alleviating the severity of this impact.
City National Plaza Parking	The City National Plaza parking lot located near the corner of 4th St. and Flower St. will experience decreased access due to construction and possible street closure.
Westin Parking Entrance	The Westin Hotel parking lot located at the corner of 5th St. and Flower St. will experience decreased access due to construction and possible street closure. The parking lot does have alternate access on Figueroa St., alleviating some of the impact.
Standard Hotel Parking Entrance	The Standard Hotel parking lot located near the corner of 6th St. and Flower St. will experience decreased access due to construction and possible street closure.
Standard Hotel Entrance	The Standard Hotel Entrance located on Flower St. will be affected by the construction impacts; however the main entrance to the hotel is on 6th St.
Floyd's Barbershop	Floyd's Barbershop located on the ground floor of the Standard Hotel has an entrance on Flower St., which will be affected by construction; however, the barber shop can also be accessed from the hotel.
Pegasus	The Pegasus Apartments will be affected by street closures and construction in the area. Traffic disruptions and construction impacts would cause difficulties for the tenants of this building and could impact leasing activities.
Daily Grill	The entrance to the Daily Grill is located at the corner of Flower St. and 7th St. Street closure in this area would make accessing the restaurant difficult from Flower St.; however, patrons will be able to access the restaurant from 7th St.
Roosevelt Lofts	Access to the Roosevelt Lofts will be difficult due to street closure on Flower St. but the development can be accessed from Hope St. Depending on the technique used to construct the tunnel for the underground segment of the track in this area, the tenants of the Roosevelt could be impacted by increased noise, vibration, and dust. This could impact vacancy rates in the high-density residential development.
City National Plaza Valet Entrance	Access to the City National Plaza valet entrance will be limited during construction due to possible street closure.
City National Plaza	The proposed underground station location for this alternative will be located at the City National Bank branch on the ground floor of the City National Plaza building.
800 W. 6th Parking	Access to the 800 W. 6th St. parking lot will be limited during construction due to possible street closure.
Cathay Bank	Access to the Bank will be limited during construction due to possible street closure.

Table 4-18 Businesses Potentially Affected During Period of Track Construction	
Flower Street	
Vieta Café	Access to the cafe will be limited during construction due to possible street closure.
Maria's Italian Kitchen	Access to the restaurant will be limited during construction due to possible street closure.
ABC Printing	Access to ABC printing will be limited during construction due to possible street closure.
Mail Box Etc.	Access to Mail Box Etc. will be limited during construction due to possible street closure.
PCS Select	Access to PCS Select will be limited during construction due to possible street closure.
Big Mamma's Pizza	Access to Big Mamma's Pizza will be limited during construction due to possible street closure.
Coffee Bean	Access to the Coffee Bean will be limited during construction due to possible street closure.
Wockano	Access to the Wockano restaurant will be limited during construction due to possible street closure.
800 Wilshire Parking	Access to the parking lot will be limited during construction due to possible street closure.
Pacific Res. Credit Union	Access to the credit union will be limited during construction due to possible street closure.

The economic impacts caused by the Underground Emphasis LRT Alternative will be limited to the station sites. For this evaluation it is assumed that a cut-and-cover technique will be used to construct the stations. This technique will generate temporary inconveniences such as increased noise, vibration, dust and particulate matter, decreased view of signage, limited or no access to business within close proximity of the station area and a general disinterest in the area when constructing the stations. Like the At-Grade Emphasis LRT Alternative, the Underground Emphasis LRT Alternative calls for the construction of a pedestrian overpass and automobile underpass, but the location would be at 1st and Alameda Streets. Construction of the overpass and underpass would necessitate additional pedestrian and roadway detours nearby. Although severe, these effects will be limited in duration and limited to the station sites, decreasing the overall effects of construction of this alternative.

If street closure is necessary to complete tunnel construction, all of the businesses mentioned in the previous section, except those located within the Civic Center area, will be negatively affected by decreased access. Table 4-19 below gives a detailed breakdown of the businesses within close proximity of the station sites.

4.14.3.3 Construction-Related Employment

Investment in transportation, including direct investment in the form of capital construction costs and operations cost, provides economic benefits in several basic ways, including the creation of jobs and investment or spending by suppliers whose goods and services are used in the project.

Table 4-19 Businesses within Close Proximity to Proposed Station Sites	
	2nd Street
New Otani Hotel	The New Otani Hotel would be affected by station construction at the corner of 2nd St. and Los Angeles St. Although the hotel is not in the direct station construction area, the main entrance to the hotel lobby as well as the parking structure is located on Los Angeles St. and the noise, dust, and vibration, in the area due to construction could potentially impact the hotel's business.
Starbucks	The Starbucks would be affected by station construction at the corner of 2nd St. and Los Angeles St. Although the coffee shop is not in the direct station construction area, the entrance of the Starbucks is located on Los Angeles St. and the noise, dust, and vibration, in the area due to construction will impact business.
Azalea Restaurant	The Azalea Restaurant would be affected by station construction at the corner of 2nd St. and Los Angeles St. Although the restaurant is not in the direct station construction area, the entrance is located on Los Angeles St. and the noise, dust, and vibration, in the area due to construction will impact business.
	Flower Street
Westin Bonaventure	The entrance to the Westin Bonaventure is located on Flower St. at the corner of 4th St. and Flower St. Station construction would decrease access to the hotel from Flower St., and construction impacts could decrease overall appeal of the hotel entrance from Flower St. The hotel does have an entrance from Figueroa St., alleviating the severity of this impact.
Miseki Restaurant	The entrance to Miseki Restaurant is located on Flower St. near the corner of 4th St. and Flower St. Station construction would decrease access to restaurant from Flower St., and construction impacts could decrease overall appeal of the restaurant. The restaurant does have access from the Westin Bonaventure Hotel, alleviating the severity of this impact.
Suede	The entrance to Suede restaurant is located on Flower St. near the corner of 4th St. and Flower St. Station construction would decrease access to the restaurant from Flower St., and construction impacts could decrease overall appeal of the restaurant. The restaurant does have access from the Westin Bonaventure Hotel, alleviating the severity of this impact.
Citi Parking Entrance	The entrance to the Citi parking lot located near the corner of 5th St. and Flower St. will have decreased access due to construction and possible street closure.
Starbucks	Starbucks, located on the ground floor of the CitiBank Center, will be affected by both the track construction on Flower St. as well as the proposed underground station between 4th St. and 5th St. Starbucks is located within the station construction area, and will be affected by noise, vibration, and dust.
Citibank	The Citibank branch located on the ground floor of the CitiBank Center will be affected by both the track construction on Flower St. as well as the proposed underground station between 4th St. and 5th St. The bank is located within the station construction area and will be affected by noise, vibration, and dust.
Uptown Drug Store	Uptown Drug Store, located on the ground floor of the CitiBank Center, will be affected by the proposed underground station between 4th St. and 5th St. Uptown Drug Store is located within the station construction area and will be affected by noise, vibration, and dust.
California Computer Center	The California Computer Center, located on the ground floor of the CitiBank Center will be affected by the track construction on Flower St. as well as the proposed underground station between 4th St. and 5th St. Although the Computer Center is not located within the station construction area, it is in close proximity and might be affected by noise, vibration, and dust.

To quantify these effects, the American Public Transportation Association commissioned the *Public Transportation and The Nation's Economy* report in the year 2000. Using the multipliers identified in this report and the construction cost estimates for the proposed alternatives, the effects of the project on the regional economy were estimated. Table 4-20 summarizes the results of this analysis.

Table 4-20 Economic Effects of the Regional Connector on the Regional Economy

Economic Affects	At-Grade (Option A)	At-Grade (Option B)	Underground
Capital Cost/Job Creation	22,190 jobs	20,086 jobs	20,194 jobs
Operations Cost/Job Creation	969 jobs	969 jobs	114 jobs
Capital Cost/Sales (x 1,000)	$2,120.04	$1,919.04	$1,929.35
Operations Cost/Sales (x 1,000)	$54.40	$54.40	$6.40

The At-Grade Emphasis LRT Alternative Option A creates the greatest number of new jobs and generates the largest amount of sales due to construction within the PSA, approximately 10.4 percent more than Option B and 9.8 percent more than the Underground Emphasis LRT Alternative. Considering job creation and increase in sales due to operations costs, the impact of the At-Grade Emphasis Alternative is 7.5 times larger than that of the Underground Emphasis LRT Alternative. The true impact of these alternatives can be seen by combining the effects of both the Capital Cost and Operations Cost. The At-Grade Emphasis LRT Alternative Option A creates 23,159 jobs and 2.17 billion dollars in sales, approximately ten percent more than Option B, and 14 percent more than the Underground Emphasis LRT Alternative.

4.14.3.4 Construction Spending on the Regional Economy

Direct investment in capital construction costs also leads to investment from businesses in the area looking to take advantage of the increase in employment activity, and purchase of supplies and equipment. This investment is considered indirect investment. Both direct investment and indirect investment streams provide businesses revenue and personal income, and income spent throughout the economy supports other jobs and related spending referred to as induced impacts. Table 4-21 displays the effects of the Regional Connector on these forms of indirect investment.

Using the SCAG regional multiplier for transportation construction and capital construction costs for the project, the indirect economic impacts of the project were identified. The results of this analysis are summarized in Table 4-21.

As previously described, the direct investment made in Option A generates the largest indirect and induced investment and income in the PSA. The total impact of Option A is $520.1 million in investment and $277.5 million in income, 10.4 percent greater than Option B and 9.9 percent greater than the Underground Emphasis LRT Alternative.

Table 4-21 Indirect Effects of Regional Connector Direct Investment (in thousands of dollars)			
Alternatives	At-Grade (Option A)	At-Grade (Option B)	Underground
Indirect Investment	$213.42	$193.19	$194.23
Indirect Jobs	1193.78	1080.60	1086.40

Induced Income	$182.32	$165.04	$165.92

4.15 Safety and Security

The purpose of this section is to characterize existing and future safety and security issues for passengers, pedestrians, motorists, and the surrounding community. This section will identify any potentially significant safety and security impacts that could occur due to transit improvements related to the project. Of concern is the potential for pedestrian and vehicular conflicts. Another aspect of this study is security, particularly whether the proposed alignment alternatives and related transit center would compromise the security of transit patrons or surrounding communities making them more susceptible to criminal activity.

4.15.1 Affected Environment

In this study, two potential routes – the At-Grade Emphasis LRT Alternative and the Underground Emphasis LRT Alternative - are analyzed for safety and security impacts. The PSA encompasses approximately two square miles of downtown Los Angeles and includes the communities of Little Tokyo, the Arts District, the Historic Core, the Toy District, Bunker Hill, the Financial District, the Jewelry District, and Civic Center. It extends from the Metro Blue Line terminus at 7th St. and Wilshire Blvd. in downtown Los Angeles to the vicinity of the Metro Gold Line Eastside Extension station at 1st and Alameda Streets.

The At-Grade Emphasis LRT Alternative assumes street running operations, which allows the operators of light rail vehicles to operate under existing traffic signals. Typically, crossing gates and railroad warning bells and lights are not warranted for street-running operations due to the low operating speeds of light rail vehicles and vehicular traffic. This aspect of the project has not been determined. The current concept is to extend dual track service from the Metro Gold Line at Temple St. using a "Y" track configuration across Alameda St. Auto traffic would be routed into a new underpass underneath the tracks, and pedestrians would use a new overpass to traverse the intersection. The tracks would extend to the west across Alameda St. and run along the south side of Temple St.

As trains continue west on Temple St. in a dual track configuration, the trackway will return to the center of Temple St. As the trackway arrives at Los Angeles St., the alignment splits into two single track alignments. One trackway would continue west to Main St. while the other trackway continues south on Los Angeles St. The alignments would run on the eastern side of both streets and a split station would be planned for each alignment just north of 1st St. The alignment then would continue south across 1st St. At 2nd St., the alignment on Los Angeles St. heads west where it then reconnects with the alignment on Main St. Both alignments would return to a dual track configuration and be located on the northern side of 2nd St., heading west until Spring St. At Spring St., the train would move to the southern side of 2nd St. as it continues west.

As the alignment continues west past Hill St., the tracks would run along the southern side of 2nd St. and enter into the existing 2nd St. tunnel. This alignment would then reduce the 2nd St. tunnel from four travel lanes to about two travel lanes. About half-way through the 2nd St. tunnel, the alignments would veer to the south punching through the tunnel wall. This would place the alignment in close proximity to Grand Ave. and a potential second station would be located in this vicinity.

Using the natural grade of the hillside, the alignment would then resurface just north of 3rd St. It would cross 3rd St. at-grade and continue south on Flower St. A third station is contemplated either at-grade or underground south of 3rd St. to just south of 5th St. Station opportunities at 3rd St. are at-grade (Option B) while stations just south of 5th St. (Option A) will need to be underground. The alignment then directly connects to the 7th St./Metro Center Station under Flower St. The Option A configuration will be 46 percent underground and 54 percent at-grade. The Option B configuration will be 38 percent underground and 62 percent at-grade.

The Underground Emphasis LRT Alternative would run entirely underground under Flower St. and 2nd St. until just beyond Central Ave., emerging to the surface before crossing Alameda St. and 1st St. at-grade and connecting to the existing station. Auto traffic would use a new underpass below the tracks at 1st St. and Alameda St. and pedestrians would cross the intersection using a new overpass. The Underground Emphasis LRT Alternative would be 94 percent underground and six percent at-grade with three underground stations.

4.15.1.1 Existing Conditions

The PSA is located in Los Angeles' dense central business district. As such, it routinely experiences high volumes of pedestrian, automobile, and track traffic. Traffic volumes in downtown Los Angeles vary considerably from block to block, and tend to be highest on streets that provide direct access to one of the nearby freeways. The busiest streets in the area include 3rd, Spring, Alameda, and Figueroa Streets. Single direction traffic volumes along some blocks are in excess of 30,000 cars per day and 3,000 during the peak hour, as is the case on much of Figueroa St. One-way configuration on some streets provides some additional capacity and signal timing efficiency, but not enough to eliminate congestion during peak hours. Truck traffic frequently uses the streets in the eastern portion of the PSA to access the industrial and warehouse districts in that area. The

trucks often have difficulty navigating the narrow streets in the area, especially when turning movements are necessary, thus creating additional traffic hazards.

Emergency vehicles frequently traverse the PSA, creating a need for streets to be clear and accessible for emergency vehicle movements. Emergency vehicle trips typically originate from one of the fire or police stations in the area. The PSA contains one fire station, at 1st and Figueroa Streets, and there is another near the PSA just southwest of 7th and San Pedro Streets. There are also two police stations in the PSA: one near 6th and Los Angeles Streets, and the central police headquarters at Parker Center, just north of 1st St. between Main and Los Angeles Streets. It should be noted that the Parker Center facility will be demolished and the police headquarters relocated to 1st and Main Streets once the new building is completed. Given the density of activities and floor space in the PSA, and the concentration of emergency facilities in the Civic Center and industrial district, Regional Connector stations and right-of-way will be designed to maintain emergency vehicle response times and not impede access to stations or the surrounding streets.

4.15.2 Evaluation Methodology

Safety relates to 1) protection of people from accidental occurrences that could injure or harm them and 2) protection of property from such accidents. For this study it includes safety of motorists and pedestrians in locations where they would cross the light rail vehicles rights-of-way, enter the stations, or encounter other transit facilities.

Security relates to 1) protection of people from intentional acts that could injure or harm them and 2) protection of property from such deliberate acts. Topics discussed include crime prevention, law enforcement, and protection against terrorism.

Pedestrian and motorist safety along the alternatives are evaluated on a qualitative level based on the experience of similar LRT systems with similar alignment types such as the Metro Blue Line, Portland MAX Line, and Hudson-Bergen Weehawken Line. For the purpose of this study it is considered that a significant safety or security impact would occur if:

- Operation of the project would result in motor vehicle accident rates that would be greater than current motor vehicle accident rates;
- Operation of the project would introduce a new hazard without adequate safety measures designed into the project to prevent accidents;
- Operation of the project would introduce a hazardous situation that would encourage people to take unsafe actions, such as providing a circuitous route for pedestrians, thereby encouraging them to jaywalk, or violate traffic signals and controls;
- The project would create a condition that facilitates criminal activity; or
- The project would create an opportunity for terrorism with a moderate to high likelihood that such an act would be perpetrated.

4.15.3 Environmental Issues

4.15.3.1 Pedestrian Safety

The introduction of a new LRT alignment will have various safety impacts. Pedestrian traffic is at a relatively high level in the PSA. For the most part, pedestrian density is most concentrated in the vicinity of the commercial and governmental facilities in the downtown segment.

At-Grade Emphasis LRT Alternative

For the at-grade alignment the following potential significant safety hazards are present:

- Passenger safety at station locations: The at-grade location of stations may introduce a new safety hazard for pedestrians if the stations do not adequately account for pedestrian traffic and movement. This hazard would be present irrespective of the frequency of occurrence. The occurrence of this hazard may be attributed to the inherent purpose of a station, where large numbers of people congregate and cross the trackway to access or depart. Pedestrian traffic stations could thus create a potential hazard of collision between pedestrians and light rail vehicles (LRVs). Anticipated passenger loads and pedestrian counts will be used to determine the most appropriate pedestrian treatments to control and channel pedestrian/passenger movements. Additionally, stations will be appropriately sized to accommodate the anticipated number of passengers.

- Pedestrian safety near the trackway: The addition of the LRV themselves would be the primary new safety hazard for pedestrian traffic. The speed of the vehicles would be similar to or slower than the adjacent automobile traffic. The LRV would be electrically powered and, therefore, would be quieter than most of the automobile traffic and may not be easily heard. This hazard includes crossings at intersections where pedestrians cross over the light rail tracks and intrusion on the right-of-way (trespassing). Channelization techniques would be used to direct pedestrians to designated pedestrians crossings and to minimize trespass. Pedestrian conflicts with trains would be minimized at the intersection of Temple St. and Alameda St. due to the construction of a new pedestrian overpass. LRVs are equipped with audible warning bells and horns which will be used, as appropriate, to alert pedestrians of the approach of a train.

- Pedestrian safety at designated grade crossings: Pedestrian safety at designated grade crossings is a key factor to be considered in the design of LRT alignments. A number of designated pedestrian grade crossings would result from the Regional Connector. A vast majority, if not all, of these pedestrian crossings would be located at motorist crossings of the tracks. A potential safety hazard would exist if pedestrians attempt to cross the tracks at locations other than designated pedestrian crossings because of the distance between designated grade crossings. In addition, potential riders who see a train approaching may cross streets and the tracks illegally in order to avoid missing the train in much the same way as these violations occur at existing bus stops and LRT stations. Also, departing passengers may be tempted to take shortcuts from station

areas to access nearby destinations instead of crossing at the designated crossings. Pedestrian traffic control and channelization techniques would be used to control pedestrian movements at intersections and encourage the use of pedestrian crossings.

Underground Emphasis LRT Alternative

There is no significant pedestrian safety issue for the Underground Emphasis LRT Alternative. This alignment would be 94 percent underground with all underground stations and only six percent of the alignment at-grade. The only at-grade crossing, at 1st St. and Alameda St., will have a pedestrian overpass that eliminates pedestrian-train conflicts. However, station designs that do not adequately account for passenger loads may cause overcrowding. Awaiting passengers may be injured by an approaching train if they do not heed warnings to stand clear of the platform edge as the train enters the station.

4.15.3.2 Motorist Safety

At-Grade Emphasis LRT Alternative

In the downtown area, the LRV would operate within the existing streets at street level. The at-grade right-of-way will be semi-exclusive as auto traffic will be generally prohibited from entering the LRT right-of-way; in general, the rail traffic would be separated from automobile traffic by curbs or other raised delineators. The only place that automobile traffic would be permitted in the right-of-way would be at street crossings. The LRV would be required to observe all traffic laws just as a car or bus would, including stopping for red lights. The LRV would also be required to yield to emergency vehicles at intersections.

Because the LRV would share the same right-of-way with automobiles and because it would be possible for automobiles to stray into the semi-exclusive rail right-of-way in other locations (by going over the curb), accidents between the LRV and motor vehicles would be possible. However, studies have shown that LRV collisions with motor vehicles at non-intersection locations are extremely rare.

At intersections, the single most frequent cause for motor vehicle/light rail accidents is when motorists turn left in front of a light rail vehicle (with the light rail vehicle traveling in the same direction). In order to reduce this risk it is assumed that a left turn from the 2nd St. or from the side streets to 2nd St. would not be permitted when LRVs are approaching the intersection from either direction.

Other accidents between LRVs and motorists stem from motorists disobeying red light signals. The LRV operators would have audible warning devices available to alert unwary drivers to the risk of accidents. Additionally, active “Train Approaching” signs may be used to further alert drivers of the approach of a train. Although all such accidents may not be totally prevented, studies have found active “Train Approaching” signs to greatly reduce the likelihood of a collision. Traffic signal phasing (all-red phase and lagging left turns) has also proven to be effective in reducing LRV and motor vehicle collisions. Train and automobile traffic would be grade-separated at the intersection of Temple and

Alameda Streets, thus providing increased safety. Furthermore the low operating speeds of the LRV and motor vehicles reduces the possibility of serious injury or damage.

Underground Emphasis LRT Alternative

There would be fewer adverse motorist safety issues for the Underground Emphasis LRT Alternative, and they would be concentrated around one intersection: 1st and Alameda Streets. This is the only grade crossing on the alignment, which would have all of its stations and 94 percent of its tracks underground. In order to reduce conflicts between train movement, automobile traffic, and pedestrian crossings at 1st and Alameda Streets, a new overhead pedestrian bridge would be constructed and automobile traffic on Alameda St. would be routed into a new underpass.

4.15.3.3 Security

This evaluation was conducted by using available crime statistics for the City of Los Angeles and reviewing other transit systems in the United States that are similar to these alternatives.

A Threat and Vulnerability Analysis (TVA), recommended by the Federal Transit Administration, will be conducted for whichever alternative is selected. This process will give a more refined and detailed study/analysis of the security environment, identifying domestic and international security threats, potential vulnerabilities/shortcomings in the transit system, and then making recommendations to reduce these vulnerabilities to acceptable levels.

The process for determining vulnerabilities begins with the identification and grouping of transit agency assets based on the criticality to transit operations, their attractiveness as targets for security breaches or terrorist attack, and their vulnerability to the impacts of a successful breach or act of terrorism. Critical assets are defined as the specific assets most critical to the Metro's ability to provide transit services and to protect people. Threat types are then identified using existing crime statistics for the area as well as threat information received from local state and federal law enforcement sources. Each critical asset is then assessed for its vulnerability of each potential threat, coupled with the frequency probability of each threat actually occurring. Severity of consequences for each threat is then given a rating from catastrophic to negligible. This information is then put into a criticality matrix which organizes the resulting consequences into categories of high, serious, and low. The matrix helps to prioritize consequences and to focus available resources on the most serious threats requiring resolution while effectively managing the available resources.

The affected environment is the security on the rail system, both at the stations and in the light rail vehicles. Passengers, transit employees, vendors, contractors and the general public who come in contact with the system, as well as the transit property and equipment, would be susceptible to the same crimes as experienced in the surrounding neighborhood, by both build alternatives.

The Underground Emphasis LRT Alternative; however, does present a different set of conditions than the At-Grade Emphasis LRT Alternative.

- Activity in the underground station and tunnel would be out of the general public view, and less observable by routine neighborhood security/police patrols in the general area, as compared to being at grade level.
- Tunnels offer non-domiciled persons refuge from the elements.
- Staircases and passageways may create opportunities for criminal activity.
- Tunnels offer a greater consequence to train service should trespassers enter; clearance and concealment issues may arise.

Employing closed-circuit television cameras, intrusion detection systems and/or dedicated security patrols mitigates these potential vulnerabilities. Additionally, the presence of transit workers in underground stations further dissuades persons from committing offenses. Several underground systems in the United States have successfully employed security technology and patrol methods to mitigate crime conditions in below-grade systems, resulting in fewer offenses committed in the transit system than in the adjacent neighborhoods they traverse.

The Underground Emphasis LRT Alternative offers a few unique security advantages not present with grade level systems:

- One distinct advantage is service operations during civil unrest, demonstrations and other public events that may occur, and historically have occurred, in the specific area for this project. Major public events, whether they are legal or unauthorized, will have a much greater impact on grade level light rail operations than on the alternative below-grade. Protesters, demonstrators and other unauthorized gatherings occur on street level, and can easily impede service, many times intentionally, for the added media exposure to their cause. This condition is highly improbable for below-grade service, as experienced in many cities with tunnel operations. Additionally, civil unrest or legal demonstrations and parades pose little risk of damage to underground systems and equipment as compared to the light rail equipment and station facilities at grade level.

Another distinct security advantage the Underground Emphasis LRT Alternative has over the At-Grade Emphasis LRT Alternative is the ability of closing and maintaining control of the system. All activity is easily controlled when there are limited access points to a system.

4.16 Construction Impacts

This section describes the expected construction methods and existing construction conditions. The conditions described in this section would only occur during construction and would be temporary and short-term.

4.16.1 Affected Environment

4.16.1.1 Construction Methods

Construction of either of the two build alternatives would employ conventional construction techniques and equipment typically used in the Southern California region for LRT projects. Major project elements include construction of guideway and trackwork, underground stations and tunnels, at-grade station platforms, installation of specialty system work, such as traction power, communications, and signaling and an underground guideway. The equipment that would be used during construction would include rail-mounted equipment, graders, dozers, cranes, cement-mixers, flat-bed trucks, and dump trucks to haul dirt and spoil materials, and tunnel boring machines.

Construction of either of the two build alternatives would be accomplished in approximately three to four years. The various work activities to be performed over the estimated construction period would include the following facility and system items:

- Demolition of roadways along alignment
- Demolition of existing buildings (if necessary)
- Construction of retaining walls for approaches to portal structures and shallow trenches
- Construction of tunnels, portal structures, cut and cover tunnel sections, and underground stations
- Relocation, modification, or protection in place of utilities in conflict or impacted by excavations for street-level trackwork, tunnels, bridge, and station construction
- Construction of at-grade station platforms using typical construction methods
- Construction of underground duct banks for electrical power feeds and for signaling/communications systems
- Construction of surface drainage systems and sub-drainage
- Construction of traction power substations with electrical power feeds
- Construction of overhead catenary pole foundations or alternative power distribution support systems and street lighting
- Installation of traffic signals and train control improvements
- Installation of overhead catenary wires, support brackets, feeder cables, and other components or alternative power distribution systems

- Installation of trackwork, including preparation of track bed and slab, rail, fasteners, and infill concrete in street-level area, and with direct fixation fasteners on the aerial guideways
- Construction of station finishes, such as canopies, fare vending equipment, station furniture, ramps, landscaping, public art, and all other amenities necessary for a functional station
- Conduction of subsystem and system testing
- Conduction of simulated operation test runs and final commissioning of the system
- Removal of all equipment, landscaping and structures along the alignment
- Relocation of any structures or landscaping from the right-of-way as required by Metro

4.16.1.2 General Construction Scenario

Surface streets in the downtown Los Angeles area would be impacted for a period ranging from 12 to 36 months. Construction would begin simultaneously at several locations along the alignment to accommodate activities requiring lengthy constructions times, such as the tunnels and underground stations, and to complete the various segments simultaneously.

Many contractors specializing in various methods of construction would be working on the proposed project for the overall length of the construction period. The physical construction would involve the application of the most suitable method for each segment of the proposed project. A representative sequence of construction is shown in Table 4-22. Many of the project elements would be constructed simultaneously for an overall duration of three years.

4.16.1.3 Regulatory Framework

Construction of the project would follow all applicable local, state and federal laws for building and safety. The Metro Fire Life Safety Committee, composed of members from the City and County of Los Angeles Fire Departments and Metro specialists, would approve all construction methods. Working hours would be varied to meet special circumstances. Standard construction methods would be used for traffic, noise, vibration and dust control, consistent with all applicable laws, and as described in the following paragraphs. For several months before passenger service begins, pre-revenue operations would be conducted to familiarize train operators with the new alignments and emergency operating procedures.

4.16.1.4 Existing Conditions

The proposed project would be constructed in several segments and would involve concurrent construction at each end. Each segment of the proposed project has its own set of construction constraints. The following subsections address the existing setting and some of the existing construction constraints.

Table 4-22 Typical Sequence of Construction Activities		
Activity	Tasks	Average Time Required (months)*
Site Survey	Locate utilities, establish right-of-way and project control points and centerlines, and relocate survey monuments	4 to 6
Site Preparation	Relocate utilities and clear and grub right-of-way (demolition), widen streets, establish detours and haul routes, erect safety devices and mobilize special construction equipment, prepare construction equipment yards and stockpile materials	12 to 18
Heavy Construction	Construct tunnels, street guideways including trackbed, subway stations and portals, trenches, piles, and disposal of excess material. Refinish roadways and sidewalks.	24 to 30
Medium Construction	Lay track, construct surface stations, drainage, backfill and pave streets.	12 to 24
Light Construction	Finish work, install all systems elements (electrical, signals, and communication), street lighting where applicable, landscaping, signing and striping, close detours, clean-up and test system.	4 to 6
Pre-Revenue Service	Test communications, signaling, and ventilation systems, train operators and maintenance personnel	3 to 6

* Some of these activities would be completed simultaneously.
Source: TAHA, 2007

7th St./Metro Center Station Area (Southern Terminus)

The southern terminus of the proposed project would be located at the existing 7th St./Metro Center Station that is currently served by the Metro Blue, Red, and Purple Lines and, by project build-out, would also be serviced by the Metro Expo Line. The proposed project would be built on the first underground level, where the Metro Blue Line currently operates. The proposed project would be an extension of the tracks currently in use by the Metro Blue Line and the tracks under construction for the Metro Expo Line. For the proposed project, the tracks would utilize the same Metro Blue Line alignment underneath Flower St. The Metro Red and Metro Purple Lines operate on a level below and perpendicular to the Metro Blue Line alignment.

Flower St. to 3rd St.

Flower St. is a three- to four-lane, 80- to 100-foot-wide roadway running north-south in downtown Los Angeles. From 7th to 3rd Streets, Flower St. is one-way in the southern direction with a Bus-Only lane in the opposite direction from 4th St. to 3rd St. Flower St. is a fully urbanized street with little to no building setbacks. Fourth St. is grade-separated from Flower St. There are mainly commercial sites along Flower St., including the Bonaventure Hotel, the Central Library, Wells Fargo Plaza, and National Bank Plaza.

3rd St. to 2nd St. Tunnel

From Flower St., the proposed alignments would travel in or beneath the existing 2nd St. tunnel. The area around 3rd and 2nd Streets from Flower St. to Hill St. (where the 2nd St. tunnel daylights) is comprised mainly of residential towers, with cultural venues, such as the Disney Hall and the Music Center, in the vicinity. The 2nd St. tunnel is bi-directional, connecting Hill and Figueroa Streets.

2nd St. to Little Tokyo/Arts District Station

2nd St. from Hill to Alameda Streets is a two-way street with one traveling lane in each direction, approximately 60 to 65 feet wide. Parking is permitted on one or both sides of 2nd St., depending on the neighborhood. There are several commercial, residential, and civic properties along 2nd St. The Los Angeles Police Department (LAPD) headquarters currently under construction and the California Department of Transportation (Caltrans) building are located adjacent to 2nd St. 2nd St. is the main street crossing Little Tokyo village, which is a cluster of restaurants and retail shops that is a visitor destination. From Central Ave. to Alameda St., 2nd St. is characterized by a commercial center and parking lots.

Main St. and Los Angeles St. to Temple St.

Main St. from 2nd to Temple Streets is characterized mainly by civic buildings, including the LAPD headquarters currently under construction, the Caltrans building, City Hall and City Hall East, court buildings, and the Los Angeles Mall. Main St. is a one-way street in the northern direction, approximately 80 feet wide. Los Angeles St. is characterized by commercial properties. Los Angeles St. is a two-way street with two to three lanes in each direction, approximately 80 feet wide. Parking is allowed on either side of the street.

Temple St. to Little Tokyo/Arts District Station

Temple St. from Main to Alameda Streets is a two-way street with two traveling lanes in each direction, approximately 80 feet wide. Temple St. terminates at Alameda St and is characterized by parking lots, large skyscrapers on the northern side, civic buildings and museums (Japanese American National Museum, The Geffen Contemporary at the Museum of Contemporary Art [MOCA]).

4.16.2 Evaluation Methodology

The construction of the proposed project would employ conventional construction methods, techniques, and equipment and would conform to accepted industry specifications and standards. Major elements of the proposed project include the construction of guideways and trackwork, underground stations and tunnels, at-grade station platforms, and below-grade separations. The analyses in this section evaluates how construction of the proposed project would affect traffic, parking, equity and environmental justice considerations, land use/neighborhoods, land acquisition/ displacement and relocation, visual quality, air quality, noise and vibration, geology, soils, and seismicity, water resources, biological resources, energy resources, safety and security, community facilities, hazards, and cultural resources.

4.16.3 Environmental Issues

This section discusses the primary environmental issues related to construction for all the environmental topics to be covered in the EIR/EIS. Each topic will be covered in more detail within specific sections of the EIR/EIS.

At-Grade Emphasis LRT and Underground Emphasis LRT Alternatives

- Construction Staging: The location of storage of construction materials and equipment, and spoils staging associated with the construction of the proposed project, at-grade or underground, can in itself be a significant impact when space is limited. Downtown Los Angeles is a fully urbanized, mostly built out area that offers very few locations for construction staging and debris relocation for any significant period of time. Impacts associated with construction staging include impacts to traffic and existing transit circulation either by the location of the staging areas or by trucks and equipment accessing these areas, proximity to sensitive receptors, both in the daytime and nighttime, amount of storage materials and/or equipment, and length of use of staging area.

- Air Quality: Construction air quality impacts tend to be short-term and are associated mainly with fugitive dust. The alignment and construction staging areas could concentrate particulate matter during the construction period and have potential impacts.

- Transportation and Traffic: Traffic and transportation impacts could be short-term (haul routes, traffic detours, street closures) or permanent (parking displacement, transit re-routing). Construction vehicles could temporarily impede traffic mobility in areas of construction. Traffic detours and truck routes would be required during construction.

- Emergency Response Times/Fire and Police Services. Potential impacts to response times or access pathways for emergency vehicles could result from street closures, detours, or from the presence of construction trucks and other equipment in the downtown area.

Underground Emphasis LRT Alternative

- Vibration: The use of boring equipment or other equipment to shore-up the tunnel and associated structures could produce vibration impacts not associated with at-grade construction.

- Soil Stability and Subsidence: Tunneling technology has improved over time and new innovations are making this type of work safer. However, the proposed project would be tunneling under a heavily urbanized area with many historic and iconic buildings in downtown Los Angeles that tend to have basements outside their parcel boundaries (i.e. basements extending under adjacent sidewalks).

- Safety and Emergency Response. Although tunneling has improved over the years, potential impairment of emergency services remains a significant issue.

- Historic Resources. Construction could impact historic or iconic structures in downtown Los Angeles, such as the Central Library, the Bonaventure Hotel, and National Bank Plaza. Additionally, there is a possibility of encountering archaeological and paleontological resources, as well as human remains.

4.17 Growth-Inducing Impacts

The following sections describe current conditions and possible growth-inducing impacts that the Regional Connector may have, not only to the PSA, but the region as a whole.

4.17.1 Affected Environment

4.17.1.1 Regulatory Framework

Guidance for the preparation of growth-inducing impacts comes from both federal and State regulations. The regulations established by the Council on Environmental Quality (CEQ), regarding the implementation of the National Environmental Policy Act (NEPA), require the evaluation of all potential environmental consequences of all proposed federal activities and programs. This provision includes a requirement to examine the indirect consequences, or secondary impacts, which may occur in areas beyond the immediate influence of a proposed action and at some time in the future (40 CFR 1508.8). Secondary impacts may include changes in land use, economic vitality, and population density, which are all elements of growth.

The California Environmental Quality Act (CEQA) also requires the analysis of a project's potential to induce growth. CEQA Guidelines Section 15126.2(d) require that environmental documents "discuss the ways in which the proposed project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment." Growth-inducing impacts also include removing obstacles to growth and may potentially include changes in the amount and distribution of growth.

Regional Growth Management Plans: The primary regional growth management plans are developed by the Southern California Association of Governments (SCAG), including the 2008 SCAG Regional Comprehensive Plan and Guide (RCPG). The RCPG describes an action plan for the implementation of short-term strategies and strategic, long-term initiatives and guiding principles for sustaining a livable region. The RCPG focuses on specific areas of planning or resource management, including land use and housing, open space and habitat, water, energy, air quality, solid waste, transportation, security and emergency preparedness, and the economy. The Growth Management chapter of the RCPG addresses issues related to growth and land use in the SCAG region and describes guiding principles for development that support the overall goals of the RCPG.

Compass Growth Vision Principles for Sustaining a Livable Region: SCAG initiated a comprehensive growth visioning process called the Southern California Compass. The Compass process seeks to accommodate growth while maintaining mobility, livability, prosperity, and sustainability goals for residents in the SCAG region.

4.17.1.2 Existing Conditions

The PSA is located in the downtown area of the City of Los Angeles and includes several communities within the City of Los Angeles, including the Financial District, Bunker Hill, Civic Center, Little Tokyo, Fashion District, Toy District, Historic Core, Jewelry District, and Central City East. SCAG is the federally designated Metropolitan Planning Organization

(MPO) for six counties in Southern California (Los Angeles, Orange, Riverside, San Bernardino, Ventura, and Imperial). SCAG's mission is to develop long-range regional plans and strategies that provide for efficient movement of people, goods, and information; enhance economic growth and international trade; and improve the quality of life for the Southern California region. SCAG is divided into 14 subregions. The PSA is in the City of Los Angeles Council of Governments (CLACG) subregion, which in addition to the City of Los Angeles also includes the City of San Fernando and portions of the unincorporated areas of Los Angeles County.

Regional Population and Housing

As illustrated in Table 4-23, the SCAG region has an existing population of approximately 18.9 million people. For the 1990 to 2008 time period, Los Angeles County contributed the largest share of total growth for the region, at 37 percent, with the addition of 1,588,570 residents. However, in terms of the relative growth rate, Los Angeles County was the slowest growing county in the SCAG region, with an annual average growth rate of approximately one percent.

Table 4-24 demonstrates that Los Angeles County has the largest number of households (3,299,573 households) in the six-county SCAG region. The total households in Los Angeles County alone comprise 56 percent of the total SCAG region.

Table 4-23 Regional Population Growth, 1990 – 2008

County	1990 Total Population	2000 Total Population	2008 Population	1990-2008 Population Change	1990-2008 Annual Average % Change
Los Angeles	8,863,164	9,519,338	10,451,734	1,588,570	0.99%
Imperial	109,303	142,361	187,001	77,698	3.90%
Orange	2,410,556	2,846,289	3,212,949	802,393	1.85%
Riverside	1,170,413	1,545,387	2,118,178	947,765	4.50%
San Bernardino	1,418,380	1,709,434	2,097,756	679,376	2.66%

Regional Employment

As demonstrated in Table 4-25, total employment in the SCAG region, including self-employment, is estimated to have increased by nearly 1.3 million jobs between 2000 and 2008.

4.17.1.3 Regional Growth Projections

As shown in Table 4-26, the SCAG region is expected to have a population of approximately 23 million people and approximately 10.5 million jobs by 2030. Along with the population and job growth, the region is expected to experience an increase from approximately 4.1 to 7.6 million households.

4.17.1.4 PSA Growth Projections

Table 4-27 shows the population, housing, and employment projections that are estimated for the PSA, the City of Los Angeles, and the CLACG subregion. For population, between 2005 and 2030, the City of Los Angeles and the CLACG subregion are expected to have a slightly higher annual average population growth rates (0.4 percent) than the PSA (0.3 percent). However, for housing, during the same time period, the PSA is expected to have a higher average annual growth in the number of households (1.2 percent) compared to the City of Los Angeles and the CLACG subregions (both 1.0 percent).

Table 4-27 Population, Housing, and Employment Growth for the Project Study Area, City of Los Angeles and CLACG Subregion, 2005-2030

Element	2005	2030	2005-2030 Population Change	2005-2030 Annual Average % Change
Population				
PSA /a/	77,823	83,492	5,669	0.3%
City of Los Angeles	3,950,347	4,309,625	359,278	0.4%
CLACG subregion	4,032,474	4,413,425	380,951	0.4%
Housing				
PSA/a/	24,049	31,244	7,195	1.2%
City of Los Angeles	1,311,134	1,637,475	326,341	1.0%
CLACG subregion	1,330,724	1,663,002	332,278	1.0%
Employment				
PSA /a/	288,990	314,936	25,946	0.4%
City of Los Angeles	1,800,766	2,223,338	422,572	0.9%
CLACG subregion	1,833,577	2,265,209	431,632	0.9%

/a/ Project Study Area is comprised of the following Census block groups: 1976, 2060.20, 2060.30, 2060.40, 2060.50, 2062, 2063, 2071, 2073, 2074, 2075, 2077.10, 2079, 2080, 2083, 2092, 2093, 2100.10, 2260
Source: SCAG 2004 Regional Transportation Plan

Table 4-27 shows projected employment growth for the PSA, the City of Los Angeles, and CLAGC subregion. It is estimated that 25,946 new jobs would be created in the PSA from 2005 to 2030, with an annual average growth rate of 0.4 percent. This rate is lower than the average annual rate for the City of Los Angeles and the CLAGC subregion over the same time period (both 0.9 percent).

4.17.2 Evaluation Methodology

Federal Transit Administration (FTA) guidelines require that regional growth projections be created by the MPO, assuming future year conditions. As mentioned in Section 4.17.1.2, SCAG is the MPO for the PSA. In order to evaluate growth-inducing impacts, the SCAG 2004 Regional Transportation Plan will be used. The RTP examines current and future transportation plans, population and employment growth, and land use data for the SCAG region to develop projections through the year 2030. The 2004 SCAG RTP serves as the basis for this analysis of growth-inducing impacts.

4.17.3 Environmental Issues

Population and Housing Growth

Fundamentally, mass transit projects do not tend to induce growth directly, except at the station level where there is opportunity for transit-oriented development (TOD). The PSA serves as a hub for most Metro buses, Metro Rail, and for bus and rail services provided by other entities, such as the Foothill Transportation Authority, the Orange County Transportation Authority, and the Montebello Bus Line. Also, the downtown Los Angeles area has recently experienced a significant rise in high-density residential development and, consequently, an increase in the number of residents in the area. Therefore, due to the high amount of transit and the high density, both residential and commercial, downtown Los Angeles already functions as a TOD. Implementation of the Regional Connector would not directly induce growth in the downtown Los Angeles area. However, it would facilitate certain developments, such as the Bunker Hill Design for Development and the Grand Avenue Project, reach their goals of more transit-oriented development.

At a regional level, the increased connectivity between the San Gabriel Valley and the Westside or Long Beach areas would not potentially induce population or housing growth. Most of these areas are already fully urbanized so it is unlikely that the increased regional connectivity would induce housing construction.

Employment Growth

The PSA is already a center of employment for the Los Angeles region. The implementation of the Regional Connector would create employment opportunities in the downtown Los Angeles area, particularly in the construction phase. However, these construction jobs would be temporary. Similar to population and housing growth, the proposed project would not directly induce employment growth, but it could serve to facilitate the movement of employees anticipated by projects that are already planned, such as the Grand Avenue Project in Bunker Hill.

The proposed project would increase connectivity by reducing the need to make several transfers from one destination to another. While this alone could change some of the perceived employment opportunities for some individuals, it is unlikely that employment growth at any of the termini would occur.

4.18 Environmental Justice

This section describes the existing conditions related to environmental justice indicators within the PSA. A discussion of the Federal and State environmental justice regulations is provided along with a demographic profile of the PSA and proposed stations areas. Ultimately, the potential impacts on minority and low-income communities will be assessed to determine if there are potential impacts that would be disproportionately borne by minority or low-income communities.

4.18.1 Affected Environment

4.18.1.1 Regulatory Framework

On February 4, 1994, Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, was signed into law. Executive Order 12898 requires federal agencies to achieve environmental justice by "identifying and addressing social and economic effects of their programs, policies, and activities on minority populations and low-income populations in the United States."7 As Executive Order 12898 applies to the United States Environmental Protection Agency (EPA), environmental justice is the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies. Fair treatment means that no group of people, including a racial, ethnic, or socioeconomic group, should bear a disproportionate share of the negative environmental consequences resulting from industrial, municipal, and commercial operations or policies. Meaningful involvement means that (1) potentially affected community residents have an appropriate opportunity to participate in decisions about a proposed activity that will affect their environment and/or health; (2) the public's contribution can influence the regulatory agency's decision; (3) the concerns of all participants will be considered in the decision making process; and (4) the decision makers shall seek out and facilitate the involvement of those potentially affected.

In response to Executive Order 12898, the U.S. Department of Transportation (USDOT) issued an Order to Address Environmental Justice in Minority Populations and Low-Income Populations. This order, issued in April 1995, sets guidelines to ensure that all federally-funded transportation-related programs, policies, or activities that have the potential to adversely affect human health or the environment involve a planning and programming process that explicitly considers the effects on minority populations and low-income populations.

Following the lead of the environmental justice movement at the federal level, a series of laws beginning in 1999 have been enacted in California to implement environmental justice. The Governor's Office of Planning and Research (OPR) has been designated the "coordinating agency in state government for environmental justice programs." As part of its new environmental justice coordinator role, OPR must now incorporate environmental justice considerations into local government planning decisions. California law requires OPR to coordinate with federal agencies regarding environmental justice based on Executive Order 12898.

4.18.1.2 Existing Conditions - Socioeconomic Characteristics

Los Angeles County

As of the 2000 U.S. Census, 9,519,338 persons lived in Los Angeles County. Approximately 69 percent of the Los Angeles County population is characterized as minority. The largest minority population is Hispanic, making up approximately 45 percent of the total population. According to the 2000 U.S. Census, approximately 18 percent of Los Angeles County is characterized as low-income.

Project Study Area

The PSA is located entirely within the City of Los Angeles and includes several districts within the City of Los Angeles, including the Financial District, Bunker Hill, Civic Center, Little Tokyo, Fashion District, Toy District, Historic Core, Jewelry District, and Central City East. Little Tokyo is the only one of these communities that has been identified as an ethnic enclave, and where disproportionate impacts could occur. As shown in Table 4-28, as of the 2000 U.S. Census, there are 18,202 persons residing within the PSA. Based on the 2000 U.S. Census data, most of the PSA has a population density of less than 250 persons per acre (Figure 4-28). In addition, there are 9,150 households and approximately 300,000 jobs[8] within the PSA. The resident unemployment rate for the PSA is 35 percent, compared to the overall Los Angeles County unemployment rate of five percent.

Approximately 80 percent of the PSA population belongs to a minority group, as shown in Table 4-28. The minority group with the largest representation in the Regional Connector PSA is African-American (29.4 percent). The second and third largest minority groups in the Regional Connector PSA are Asian (24.5 percent) and Hispanics/Latinos (21.9 percent), respectively. The Regional Connector PSA is composed of less than ten percent of the following races: American Indian or Native Alaskan, Native Hawaiian or other Pacific Islander, or other race. Of the total population, 3.2 percent identify themselves as belonging to more than one race. Additionally, the percentage of White, Non-Hispanic for the PSA is approximately 20 percent. The demographic density for the PSA is shown in Figure 4-9.

The median household income in the PSA was $10,295 according to the 2000 U.S. Census. Of the various income levels shown in Table 4-28, the highest percentage of the working population (15 percent) earned less than $10,000 per year. In the 2000 U.S. Census, which is the latest census information, 92 percent of the PSA's population (16,722 persons) was evaluated for poverty status. Poverty status computations are derived by the U.S. Census using the Health and Human Services poverty thresholds (Table 4-29). As shown in the Table 4-28, 46.8 percent of the population in the PSA is living below the poverty threshold.

Limited English Proficiency

Executive Order 13166 requires federally assisted programs to identify any need for services to those persons with limited English proficiency (LEP) and develop and implement a system to provide those services so LEP persons can have meaningful access to them. The 2000 U.S. Census data indicates that approximately 21 percent of the population in the PSA was linguistically isolated (i.e., all household members over age five have limited English proficiency [not well to not at all]). Approximately 63 percent of this linguistically-isolated population (1,872 persons, or 14 percent of total population over five years of age) spoke an Asian or Pacific Island language and 35.44 percent (1,059 persons or 10.4 percent of total population over five years of age) spoke Spanish (Figure 4-9). The geographic distribution of linguistically isolated Asian or Pacific Island language-speaking households corresponds with the distribution of the Asian population in the area around Little Tokyo (Figure 4-9).

Elderly Population

According to the 2000 U.S. Census, approximately 19 percent of the PSA population is elderly (approximately 3,500 persons). As shown in Figure 4-11, the distribution of the elderly population corresponds with the geographic distribution of LEP residents in Little Tokyo (Figure 4-10).

The Homeless and Single Room Occupants

In downtown Los Angeles, a major low-income group primarily consists of the homeless. However, the 2000 U.S. Census does not include the homeless in their calculations. In 2007, the Los Angeles Homeless Services Authority released the 2007 Greater Los Angeles Homeless Count, which is a report on a physical counting effort conducted to better estimate the number of homeless in the City of Los Angeles. The count found approximately 68,600 homeless persons at any one time in the City of Los Angeles. In the area where the PSA is located, there are approximately 22,030 homeless persons, which account for 32 percent of the total homeless population of the City of Los Angeles. As approximately one-third of the total estimated homeless population of the City is in the PSA, many services and shelters that serve this population are present as well. There are approximately four shelters, some year-round, 15 to 16 single-room occupancy establishments (SROs), and approximately nine homeless service providers within one-quarter mile of the proposed alignments. Resources for the homeless population within the PSA are listed in Table 4-30.

Alignment Areas

The total alignment is approximately 1.7 miles. Since the proposed stations would be in close proximity to each other, over the short distance of the two build alternatives, any analysis at the station level would be repetitious. Therefore, an analysis of the entire alignment was conducted for socioeconomic impacts. Census block groups within a one-quarter mile radius of the alignment locations were evaluated. The results are summarized in Table 4-31.

* At-Grade Alternative - Option A (A)
At-Grade Alternative - Option A (B)
Underground Alternative (U)

As shown in Table 4-31, there are 11,369 persons and 5,482 households within one-quarter mile of the At-Grade Emphasis LRT Alternative. The unemployment rate for the area within one-quarter-mile of the At-Grade Emphasis LRT Alternative is 24.1 percent compared to the overall Los Angeles County unemployment rate of five percent.

Approximately 80 percent of the population in the area within one-quarter mile of the At-Grade Emphasis LRT Alternative belongs to a minority group, as shown in Table 4-31. The minority group with the largest representation for the At-Grade Emphasis LRT Alternative is Asian (33.3 percent). The second and third largest minority groups are Hispanic/Latino (24.2 percent) and African American (19.1 percent), respectively. The area within one-quarter mile of the At-Grade Emphasis LRT Alternative is composed of less than ten percent of the following races: American Indian or Native Alaskan, Native Hawaiian or other Pacific Islander, or other race. Of the total population, 2.2 percent identify themselves as belonging to more than one race. Additionally, the percentage of White, non-Hispanic population for the area within one-quarter mile of the At-Grade Emphasis LRT Alternative is approximately 20 percent.

The median household income in the area within one-quarter mile of the At-Grade Emphasis LRT Alternative was $14,753 according to the 2000 U.S. Census. Of the various income levels shown in Table 4-31, the highest percentage of the working population (31.7 percent) earned less than $10,000 per year. In the 2000 U.S. Census, 90.3 percent of the PSA's population (10,275 persons) was evaluated for poverty status. Poverty status computations are derived by the U.S. Census using the Health and Human Services poverty thresholds (Table 4-29). As shown in the Table 4-31, 36.6 percent of the population in the area within one-quarter mile of the At-Grade Emphasis LRT Alternative is living below poverty.

For the Underground Emphasis LRT Alternative, as shown in Table 4-31, there are 11,496 persons and 5,677 households within one-quarter mile. The unemployment rate for the area within one-quarter mile of the Underground Emphasis LRT Alternative is approximately 23.3 percent compared to the overall Los Angeles County unemployment rate of five percent.

Approximately 79 percent of the population in the area within one-quarter mile of the Underground Emphasis LRT Alternative belongs to a minority group, as shown in Table 4-31. The minority group with the largest representation for the Underground Emphasis LRT Alternative is Asian (33.6 percent). The second and third largest minority groups are Hispanics/Latinos (23.5 percent) and African-Americans (18.8 percent), respectively. The area within one-quarter mile of the Underground Emphasis LRT Alternative is composed of less than ten percent of the following races: American Indian or Native Alaskan, Native Hawaiian or other Pacific Islander, or other race. Of the total population, 2.4 percent identify themselves as belonging to more than one race. Additionally, the percentage of White, Non-Hispanic for the area within one-quarter mile of the Underground Emphasis LRT Alternative is approximately 20 percent.

Source: 2000 U.S. Census

The median household income in the area within one-quarter mile of the Underground Emphasis LRT Alternative is $18,776 according to the 2000 U.S. Census. Of the various income levels shown in Table 4-31, the highest percentage of the working population (13.9 percent) earned less than $10,000 per year. In the 2000 U.S. Census, 90.5 percent of the PSA's population (11,496 persons) was evaluated for poverty status. Poverty status computations are derived by the U.S. Census using the Health and Human Services poverty thresholds (Table 4-29). As shown in the Table 4-31, 34.8 percent of the population in the area within one-quarter mile of the Underground Emphasis LRT Alternative is living below the poverty threshold.

4.18.1.3 Public Participation

To ensure opportunities for public participation during the project development process, Metro held four public project scoping meetings, two in the early planning process and two after the alternatives screening process. The first early scoping meeting was held on November 6, 2007, at the City of Los Angeles Central Library in downtown Los Angeles, and the second on November 7, 2007, at the Japanese American National Museum in Little Tokyo. A total of 117 people attended the two meetings to provide comments on the alignment alternatives for the proposed project. Two additional meetings to provide a progress update of the alternatives screening were held at the Japanese American National Museum and at the City of Los Angeles Central Library on February 26, 2008.

The format of the scoping meetings included an open house element where attendees had the opportunity to review the project information prior to the start of the presentation and the comment period. Project team members were present at the display boards to address questions related to the project. Spanish and Japanese translators were made available, as appropriate. Following the open house period, a PowerPoint presentation was made to provide attendees with information regarding the purpose of the scoping meeting and the proposed project. Emphasis was placed on the importance of the community's participation in providing comments in person at the scoping meetings, or by telephone, fax, postal mail, or e-mail. Following the presentation, the public was given the opportunity to make verbal comments, which were recorded by a transcriber. The deadline for receiving comments was November 30, 2007. A total of 88 comments were received by Metro from public agencies, community organizations, elected officials, and the general public.

Of the 88 comments received by Metro, 16 were directly related to the topic of environmental justice. Three of these 16 comments were regarding Americans with Disabilities Act (ADA) compliance and access, and regarding community impacts. There was much coordination with numerous downtown community committees, including the Little Tokyo Subcommittee and other groups. Several presentations were conducted, including those after the second round of public meetings held in October 2008, in order to keep community members informed of project updates and public participation.

Table 4-32 Public Meetings			
Type of Meeting	Date	Location	Number of Attendees
Early Scoping Meeting	November 6, 2007	Central Library	68
Early Scoping Meeting	November 7, 2007	Japanese American National Museum	49
Community Update Meeting Series #1	February 26, 2008	Japanese American National Museum	59
Community Update Meeting Series #1	February 28, 2008	Central Library	55
Community Update Meeting Series #2	October 16, 2008	Central Library	109 Combined
Community Update Meeting Series #2	October 21, 2008	Japanese American National Museum	

4.18.1.4 Project Alignment Alternatives Screening Process

As part of the required screening process, segments of several proposed alignments were eliminated from consideration in the PSA. As part of the public outreach effort, 33 alternatives were presented at the early scoping meetings in November 2007. At each of the two public meetings, each alternative was presented in various ways, from poster boards to PowerPoint slides; which were accessible as well by internet through the Metro page www.metro.net. After the public input was incorporated into the screening process, eight alternatives remained and were identified for further screening. With a thorough screening process as described in the Alternative Screening Report, six of the eight alternatives were eliminated from further consideration for environmental evaluation. The two remaining alternatives were presented at the May 2008 public meetings.

4.18.2 Evaluation Methodology

In assessing compliance of the proposed project with the intent of Executive Order 12898 regarding environmental justice, there are three major considerations:

- Whether the project provides transit service equity;
- Whether any potential adverse impacts would be disproportionately borne by low-income and minority communities; and
- Whether low-income and minority communities have had opportunities to actively participate in the planning of the project.

The analysis of impacts also considers:

- Adverse impacts to human health;
- Adverse environmental impacts to natural resources;
- Impacts that would adversely affect the stability and economic and social functioning of a community or neighborhood; and

- Adverse impacts related to noise and vibration, displacement and relocation, and pedestrian safety and security in low-income and minority communities.

As mentioned in Section 4.18.1.2, Little Tokyo is the only established ethnic community in the PSA. For this analysis, disproportionate impacts to Little Tokyo will be evaluated.

4.18.3 Environmental Issues

The following are potential environmental justice impacts associated with the proposed project.

At-Grade Emphasis LRT Alternative

- Transit Service Equity Impacts. The At-Grade Emphasis LRT Alternative would bypass and place stations outside the only established minority community in the PSA, Little Tokyo, but would keep the current location of the Little Tokyo/Arts District station along Alameda St. Additionally, as shown in Figure 4-11, Little Tokyo contains a high concentration of elderly, which are often transit dependent. Routing the alignment and locating a proposed station outside Little Tokyo can be perceived as a potential environmental justice impact because it can be interpreted as a lack of transit infrastructure investment in an under-represented community. However, the close proximity of the Little Tokyo/Arts District Station (one-quarter mile away), which is part of the Metro Eastside Extension, minimizes the potential of these justice impacts.

- Displacement Impacts. Pertaining to the homeless, changes in sidewalk widths may potentially have direct impact on homeless encampments.

Underground Emphasis LRT Alternative

- Transit Service Equity Impacts. The alignment for the Underground Emphasis LRT Alternative would traverse Little Tokyo underground and surface at a proposed portal at 1st and Alameda Streets. The Underground Emphasis LRT Alternative would introduce a station on 2nd St. between Los Angeles and Main Streets. Although the station is not within Little Tokyo, it is located next to the Little Tokyo branch library as well as the future location of the Block 8 development which is a significant Japanese inspired condominium and rental housing property scheduled to be opened in the Spring of 2009.

- Noise Impacts. The proposed project has potential to have noise impacts related to the proposed portal location at 1st and Alameda Streets. There are sensitive receptors around the portal area (museums and residences). This could be considered disproportionate because the portal would be located in the only minority community in the PSA.

- Construction Impacts. Bored tunnel construction impacts would be largely concentrated at portal areas where equipment is inserted for underground use or where debris from tunnel mining is removed. Portals will be concentration points of construction activity, including workers, stationary equipment, and truck activity. Construction in the portal area within the Little Tokyo community may be particularly disruptive to residences and businesses in this minority community.

4.19 Major Utilities

As part of the evaluation of existing conditions along the different alignment alternatives, major utilities are identified in order to assess potential impacts to the infrastructure. This process allows for identification of potential conflicts and resolution to these issues in the early stages of design and development of alternatives.

4.19.1 Affected Environment

There are several items that control the utility work design, including gravity lines, sanitary sewers, storm drains, telephone cables, and other power lines such as water and gas. The physical dimensions of these utilities vary from one to the next and various elements affect the placement and relocation of each. Gravity lines are usually the deepest utility which eventually controls the top of the station structure; sanitary, sewer, and storm drains are in this category. For sanitary sewers, polyvinylchloride (PVC) is utilized temporarily during underground station construction. Permanent vitrified clap pipe (VCP) is then installed during the restoration phase. For storm drains, temporary lines are installed during underground station construction. Permanent reinforced concrete pipe (RCP) is then constructed during the restoration phase.

Generally, it is preferable to save telephone cables. During underground and at-grade station construction support, the existing telephone duct bank remains in place. If the telephone duct bank is shallow, then breaking the existing ducts is required and lower supports are needed in order to clear the decking structure. During restoration phase, the telephone duct is encased in concrete.

Overhead power lines impacted by construction are to be relocated or new underground cables are installed as needed. For an underground configuration, during station construction, electrical ducts should be supported in place. If the electrical duct bank is shallow, then it requires lowering and supporting to clear the decking structure. Existing water lines are usually cast iron, which means they tend to have weak joints. During underground construction, new steel water lines will be constructed above the excavation, to be supported from the decking structure. The use of ductile iron pipes is restricted to lengths up to 20 feet. Also, for underground structures, new steel gas lines are to be installed above the excavation and to be supported from the decking structure.

The identification of all the above utilities is essential in order to understanding the existing conditions in the PSA as well as to understand potential design restrictions which must be considered.

4.19.2 Evaluation Methodology

The main source used for utility locations is the City of Los Angeles' Electronic Vault. This resource, which is part of the Bureau of Engineering division, provides detailed data history and utility characteristics which aid in assessing the impacts of construction.

For assessing the impact of construction, the existing utility data and information was incorporated and superimposed on LADOT Traffic Geometric plans, along with all the potential alternative alignments. One of the crucial issues for drawing existing utilities from as-built maps to the various alternative corridors was to locate the exact location of the current right-of-way. The mapping and discussions related to utilities were directed at street segments where a number of conflicts and/or issues may arise. Existing utility data were first obtained at intersections along the alignment, including Alameda St., 2nd St. and Flower St. Other key locations are intersections along 2nd St, including Central Ave, San Pedro St., Los Angeles St., and Main St., and the Flower St. segment with intersections at 3rd, 4th, 5th and 6th Streets.

4.19.3 Environmental Issues

Implementation of the Underground Alternative would result in potential impacts to underground utility lines that would be avoided with the At-Grade Emphasis LRT Alternative. The following describes the utility issues along the alignment for the Underground Emphasis LRT Alternative and the impacts they may present.

At-Grade/Underground Affects on Flower St. and Intersections at 6th, 5th, 4th, and 3rd Streets

Between 3rd and 4th Streets there is a 33-inch storm drain line. There is a large gravity line, 72-inch to 84-inch reinforced concrete pipe (RCP) which turns from 4th St. onto Flower St. and continues south to 6th St. At 5th St., the 84-inch pipe changes temporarily to an eight-feet six-inch by 36-inch concrete box to allow a sanitary sewer line to cross underneath. At 6th St., the 72-inch RCP discharges into a 48-inch line and a 36-inch line. At the intersection of Flower and 6th Streets, the pipes are approximately 15-feet deep. There are also two storm drain manholes within this intersection.

Heading south on Flower St. from the potential station at Grand Ave., the alignment heads underground. The large gravity lines in this area will impact the location of the underground structures such as the tunnel, cut and cover, and stations. Identification of these lines in plan and cross sections are being studied at the present time.

A 15-inch concrete sanitary sewer crosses 7th St. 12 feet below grade. A 21-inch sanitary sewer crosses Wilshire Blvd. 14 feet below grade. A 20-inch sanitary sewer crosses 5th and 6th Streets 12-feet below-grade. A 30-inch storm drain crosses 4th St., one to 15 feet below-grade and an 18-inch sanitary sewer crosses 3rd St. 27 feet below-grade.

One of the noticeable things about the sanitary sewer pipes is the change in sizes throughout various segments of the pipeline. This may indicate merging pipe through deep man holes or junction structures. These would impact the underground structures.

At-Grade/Underground Affects on 2nd St. between Hill St. and Spring St.

An information gap for the section of 2nd St. between Hill St. and Spring St. exists in data files, and further research is being conducted in order to correctly identify all utility types and locations. Currently, relieving pressure system discharges storm water over the 2nd St. tunnel, directing 12-inch to 24-inch diameter drain lines located at both sides of the tunnel adjacent to the sidewalks. More investigation is needed to identify the causes of this occurrence. A storm drain is also located on the north side of 2nd St., east of the 2nd St. tunnel.

At-Grade/Underground Affects on 2nd St. between Main St. and Los Angeles St.

Currently, there is a large storm drain gravity line, nine-feet six-inch by 11-feet six-inch reinforced concrete box. There is also a 14-inch storm drain line running on the northern side of the 2nd St., approximately 13 feet away from the northern property line and about four feet underground. There are two sanitary sewer lines located on each side of the nine-feet six-inch by 11-feet six-inch storm drain, with an 18 inch distance from the center line to the face of the larger pipe. One of the lines is a 14-inch diameter pipe with 17.5 feet distance from the northern line of the property, located 16 feet underground. The second line is an eight-inch diameter pipe with 23-feet distance from the southern line of the property, located 16 feet underground.

Other utilities in this area are telephone, cable, and power lines with three-inch to 22-inch diameter conduits located approximately four feet underground. Water and gas lines are also located four feet underground and between two inches to six inches in diameter. Two gas lines are abandoned and one line of gas and the water line are active lines.

One of the options for the Underground Emphasis LRT Alternative is the location of a potential station somewhere in between these streets on 2nd St. Although the location of this station has not been determined, existing utility lines may impact the station wall footings and catenary pole footings.

At-Grade/Underground Affects on 2nd St. between Los Angeles St. and Central Ave.

Between Los Angeles St. and Central Ave. there is a large storm drain gravity line and an 11-feet six-inch by 13-feet reinforced concrete box. There is also a 44-inch storm drain line running on the north side of 2nd St., 16 feet away from the northern property line and about six feet underground. There are two sanitary sewer lines located on both sides of the large storm drain 18 inches or more in distance away from the storm drain line's outside face. The first line is an eight-inch sanitary sewer line, 23 feet away from the northern property line, located 16 feet underground. The second line is an eight-inch sanitary sewer line, 18 feet away from the southern property line, located 16 feet underground.

Other utilities in this area are telephone, cable, and power lines with four-inch to 25-inch diameter conduits located approximately four feet underground. Water and gas lines are also located four feet underground, with the water line at eight inches and the gas line at six inches in diameter.

Potential impacts may occur in the area where the alignment curves off Alameda St. to enter southwest through private properties toward 2nd St. This area has a higher than average level of congested utility lines and would need to be further studied and evaluated.

At-Grade/Underground Affects on 2nd St. between Main St. and Spring St.

Between Main and Spring Streets there is a large storm drain gravity line and a 9.5-feet by 11.5-feet reinforced concrete box. There is also a 14-inch storm drain line running on the north side of the street approximately 15 feet away from the northern property line, about six feet underground. There are two sanitary sewer lines located along this segment. One of the lines is an eight-inch sanitary sewer line located above the large storm drain pipe, located ten feet underground. The second line is an eight-inch sanitary sewer line located on the north side of the large storm drain pipe, located ten feet underground and approximately 25.5 feet away from the northern property line.

Other utilities in this area are telephone, cable, and power lines with diameters ranging from 12-inch to 29-inch located at a maximum of six feet underground. Water and gas lines are also located four feet underground, and range from four inches to six inches in diameter. Two gas lines and one water line are abandoned.

At-Grade/Underground Affects on 2nd St. between Spring St. and Broadway

Between Spring St. and Broadway there is a large storm drain gravity line, and a 9.5-feet by 11.5-feet reinforced concrete box. There is a 14-inch line running on the north side of the street, approximately 15 feet in distance from the northern property line and six feet underground.

There are two sanitary sewer lines located along this segment. One of the lines is an eight-inch sanitary sewer line located above the large storm drain, approximately ten feet underground. The second line is also an eight-inch sanitary sewer line located north, off the large storm drain line, approximately ten feet underground, and 25.5 feet away from the northern property line.

Other utilities in this area are telephone, cable, and power lines with 12-inch to 29-inch diameter conduits located approximately six feet underground. Water and gas lines ranging from four inches to six inches in diameter are located at a maximum of four feet underground. Two gas lines and one water line are abandoned.

At-Grade/Underground Affects on 2nd St. between Broadway and Hill St.

Between Broadway and Hill St. there is a storm drain large gravity line, ten-inch diameter reinforce concrete pipe (RCP) approximately 22 feet underground. This line alignment moves north approximately 15 feet after passing the Hill St. intersection. There are also two eight-inch storm drain lines running on the north and south sides of the street, approximately three feet underground.

An eight-inch sanitary sewer line is located north of the large sanitary sewer approximately 18 feet underground.

Other utilities in this area are telephone, cable, and power lines with 22-inch to 41-inch diameter conduits located at a maximum of six feet underground. This particular location, however, also has a deeper line at 16 feet underground. Water and gas lines ranging from four inches to eight inches in diameter are located at a maximum of four feet underground. There is an eight-inch gas line that is abandoned.

Affects on Alameda St. at Temple St. (At-Grade), 1st St., and 2nd St. (Underground)

In the PSA, Alameda St. is a very heavily trafficked corridor that is used by both automobiles and large freight trucks. The land uses around the Alameda St., 1st St., and 2nd St. intersections has experienced a change from low scale industrial to residential/commercial in the past years. Because a grade separation is being proposed as a solution for possible congestion issues, utilities in and around the area must be identified thoroughly in order to design the station and tunnel to appropriate standards.

Currently, there is a 12-inch water line located approximately in the center of Alameda St. and another 36 inch water line located on the west side of the street. A 14-inch sanitary sewer is located on the eastern side of Alameda St. A 75-inch storm drain is also located on the eastern side of Alameda St. as well as 14-inch lines that run along the length of the street. There also exist electrical boxes with two and three conduits, telephone lines, and a six-inch abandoned gas line. This area is critical because a grade separation (underpass) built along Alameda St. from approximately north of Temple St. to south of 2nd St. will mean the removal and relocation of these utility lines.

For this particular scenario, it is advised that the 75-inch storm drain cannot be located under the northbound bus deck because there would not be enough room. Instead, two possibilities are suggested: 1) change the storm drain pipe such that it runs under the southbound bus deck (west of Alameda St.) or 2) relocate the project alignment east of the Metro Eastside Extension LRT tracks where there is a passage. With the first option,, the storm drain pipe would be relocated to pass the grade separation (north of Temple St.) and meet its original alignment south of 2nd St. This option would be preferred over altering the project alignment, as that would require significant additional analyses and public input. Once the large storm drain is relocated, the smaller pipes can be moved under the bus deckway. The crossing utility lines can be supported from the beam bridge decks at Temple and 1st Streets.

4.20 Summary of Environmental Issues

Section 5 Financial Analysis

5.1 Introduction

This section provides a comparison of the capital and operating and maintenance costs and revenues associated with the promising alternatives under consideration for the project. These alternatives consist of a No Build, TSM and two build alternatives. The build alternatives are comprised of an at-grade and cut-and-cover alternative (At-Grade Emphasis LRT Alternative) that includes two configuration options (Option A and Option B) and a twin-bore tunnel alternative (Underground Emphasis LRT Alternative). It is important to note that this financial analysis was conducted prior to the recent national economic crisis. As the impacts of this crisis are still working their way through the private and public sectors, including transit systems, the cost and revenue assumptions described in the following sections should be considered preliminary and will likely need to be refined. As the Regional Connector continues through the project implementation process, cost, funding and financing projections will be revised to reflect the best available information.

Section 5.2 focuses on the capital costs of the alternatives. Costs are presented in both base year and Year of Expenditure (YOE) dollars using annual inflation rates and a preliminary implementation schedule developed for the project. In order to understand the financial impact of actual funds that would need to be expended in the actual year of expenditure and the relative effects of inflation on costs and revenues, an inflation rate is used to project from base year dollars to YOE dollars. More specifically, YOE dollar values are computed by multiplying base year dollar values by the compounded escalation factor for the year in which funds would be expended. For example, in YOE dollars, $1.00 in 2008 is equivalent to $1.04 in 2009, using an inflation rate of 4.0 percent.

Additionally, the capital costs are presented using FTA's Standard Cost Categories (SCC). FTA implemented the SCC to establish a consistent format for the reporting, estimating and managing of capital costs for projects proceeding through the New Starts major capital project development process.

Following the discussion of capital costs, Section 5.3 describes the potential federal, state, and local capital revenue sources and funding strategies that could be used for the Regional Connector project. For purposes of this analysis, the Regional Connector build alternatives are assumed to be funded with a combination of federal and non-federal funds, including 50 percent in FTA New Starts (Section 5309) funding and 50 percent in local funding from a combination of state and local sources. The proposed funding sources are described first, followed by a discussion of other potential state and local sources. Funding strategies considered include the potential for changes to Metro's policy regarding bonding capacity. Also considered is the potential to work with FTA to include the Regional Connector project as part of a multi-corridor program of projects, to be funded through the FTA New Starts program, similar to the process being used in Salt Lake City and Houston.

Section 5.4 compares projected operating and maintenance (O&M) costs of the alternatives and projected farebox revenues assuming average fares consistent with Metro services. This section also identifies potential system-wide operating savings that could be realized due to improved efficiency of service associated with the selected alternatives. An estimate is also provided of the potential level of operating support required.

Section 5.5 summarizes the key findings of the preliminary financial analysis. As the alternatives selection process moves forward, future iterations of the financial analysis will be conducted, with increasing levels of detail and refinement. The refined financial analysis will include a detailed cash flow analysis in YOE dollars through the project horizon year of 2030.

5.1.1 Background

The Regional Connector project is proposed to create a connection in downtown Los Angeles that will link the Metro Blue and Expo Lines termini at 7th St./Metro Center Station (7th and Flower Streets) to the Metro Gold Line Pasadena and Eastside links at the Little Tokyo/Arts District Station at 1st and Alameda Streets. This connection will provide through service between the Metro Blue Line to Long Beach, the Metro Gold Line to Pasadena and East Los Angeles, and the Metro Expo Line to Culver City. With the implementation of the Regional Connector, these four lines will share tracks and stations in downtown Los Angeles. The result of this connection will be enhanced regional connectivity without the need to transfer thus making it easier for potential riders to get to and from downtown Los Angeles.

5.1.2 Status of the Regional Connector Transit Corridor in Existing Long Range Financial Plans

The Regional Connector Transit Corridor is included in both of the existing long range financial planning documents for the region: Metro's 2008 Long Range Transportation Plan (LRTP) and the Southern California Association of Governments Regional Transportation Plan (SCAG RTP). Within the LRTP, the Regional Connector Transit Corridor is the highest priority project within the Strategic Unfunded component of the plan and is one of 12 "Tier 1" projects that are "currently under planning study or environmentally cleared/route refinement study." Projects in the Strategic Unfunded component of the plan could be implemented if additional funding were made available from new sources. With regard to the SCAG RTP, the Regional Connector is included as a funded project (project identification number 1TR0404) at an estimated cost of $4.24 billion and is assumed to be completed by 2035.

5.1.3 Description of the Alternatives

The following provides a brief overview of the alternatives under consideration in order to reflect assumptions used for the cost estimates. See section 2 for maps of alternatives for consideration.

No Build Alternative

The No Build alternative includes all existing transportation facilities as well as all committed transportation projects outlined in the Metro LRTP (2001) and the SCAG Regional Transportation Plan (2004). This includes the Metro Gold Line Eastside Extension (Phase 1) scheduled to open in 2009, the first and second phase of the Metro Exposition Line scheduled to open in 2010, and the second phase of the Metro Rapid Bus expansion plan scheduled to be completed in 2008. An update to Metro's LRTP was released for public review in March 2008 and is anticipated to be finalized and approved during the winter of 2008. This final AA study will reflect the 2001 LRTP commitments but acknowledge the potential inclusion of additional projects pending the approval of the updated plan. The No Build Alternative would preserve existing service levels, as well as the projects listed in the LRTP and Regional Transportation Plan. It may also call for improving service frequency in some areas, but will largely leave the present transit coverage unchanged.

TSM Alternative

The TSM Alternative would assume no build and would imitate the proposed light rail link between 7th St./Metro Center Station and Union Station using two shuttle bus routes. Shuttle buses operated by Metro would run frequently, perhaps just a few minutes apart during peak hours, and routes would be designed to move passengers between the two stations as quickly as possible. The shuttle buses would use mixed-flow arterial street lanes or existing bus only lanes and attempt to avoid major conflicts with existing bus routes. Peak-hour parking restrictions would facilitate the movement of the shuttle buses along the routes. Intermediate stops would provide additional transit coverage of Bunker Hill, Little Tokyo, and the Civic Center. A variety of bus sizes could be used to tailor capacity to demand, ranging from 30-foot shuttle buses to 60-foot articulated buses.

In addition to frequent headways, Regional Connector shuttle buses could employ a Transit Priority System (TPS) system similar to the ones currently used on Metro Rapid lines within the City of Los Angeles. Transponders mounted to the undersides of the buses would trigger detector loops embedded in the pavement in advance of each signalized intersection along the route. Upon detecting the bus, the City's central Automated Traffic Surveillance and Control (ATSAC) system would trigger the signal controller to grant additional green phase time to the oncoming bus (usually 10-15 percent of the total cycle time), up to once per cycle. Metro Rapid lines have shown TPS to keep buses moving quickly, reduce trip times, and increase passenger throughput.

Build Alternatives

Based on the results of a detailed screening process, two build alternatives are being recommended to be carried forward for further evaluation: a combined at-grade/underground alternative that includes one-way couplets on Main St. and Los Angeles St. (At-Grade Emphasis LRT Alternative) and an alternative that is almost entirely underground (Underground Emphasis LRT Alternative). The At-Grade Emphasis LRT Alternative includes two alignment options that are still under consideration. A description of the alternatives is provided below.

At-Grade Emphasis LRT Alternative Option A

The At-Grade Emphasis LRT Alternative Option A is 1.8 miles long with approximately 71 percent of the alignment at grade and 29 percent of the alignment underground. The underground portions of the alignment are proposed to use the cut and cover construction technique. The estimated capital cost of the At-Grade Emphasis LRT Alternative – Option A is $795.7 million in FY2008 constant dollars, or $1.019 billion in Year of Expenditure throughout (YOE) dollars, inclusive of inflation.

The At-Grade Emphasis LRT Alternative Option A has a total of three station locations, of which two are underground and one is at-grade. The underground stations are at Flower St. between 5th and 6th Streets, and adjacent to the Grand Avenue Project development, south of 2nd St. The third station is a split station (two platforms) located at grade with one on Main St. and one on Los Angeles St.

As shown in Figure 5-1, the alignment for the At-Grade Emphasis LRT Alternative – Option A, from west to east, begins/ends at the existing underground 7th St./Metro Center station and heads north under Flower St. resurfacing to an at grade alignment via a portal located north of 4th St. The alignment continues across 3rd St. in a northeasterly direction where it then enters the existing hillside and 'punches' into the existing 2nd St. tunnel.

The alignment then uses the existing 2nd St. tunnel to run east, at-grade in a dual track configuration until it reaches Main St. The alignment splits into a couplet configuration at grade, with one track continuing north on Main St. and the other track continuing east on 2nd St. to north on Los Angeles St.

Both tracks then head east on Temple St. realigning into a dual track configuration at Los Angeles and Temple Streets. The alignment then heads east until the connection with the Metro Gold Line at Temple and Alameda Streets. In this alignment, 2nd St. between Los Angeles St. and Hill St. is transformed into a transit mall.

At-Grade Emphasis LRT Alternative Option B

The At-Grade Emphasis LRT Alternative Option B is 1.79 miles long with approximately 79 percent of the alignment at grade and 21 percent of the alignment underground. The underground portions of the alignment are proposed to use the cut and cover construction technique. The estimated capital cost of this option is $709.3 million in FY2008 constant dollars, or $909.1 million in YOE dollars, inclusive of inflation.

The At-Grade Emphasis LRT Alternative Option B has a total of three stations locations, of which one is underground and two are at-grade. One at-grade station is on Flower St. between 3rd and 4th St. A second station is located adjacent to the Grand Avenue Project development, and a third station is a split station (two platforms) located at-grade with one on Main St. and one on Los Angeles St.

As shown in Figure 5-2, the alignment for the At-Grade Emphasis LRT Alternative – Option B, from west to east, begins/ends at the existing underground 7th St./Metro Center Station and heads north under Flower St., resurfacing to an at-grade alignment from a portal located north of 5th St. The alignment continues on Flower St. at-grade and then across 3rd St. in a northeasterly direction where it then enters the existing hillside and 'punches' into the existing 2nd St. tunnel. The alignment then uses the existing 2nd St. tunnel to run east, at-grade in a dual track configuration until it reaches Main St. The alignment splits into a couplet configuration at-grade, with one track continuing north on Main St. and the other track continuing east on 2nd St. then north on Los Angeles St. Both tracks then head east on Temple St., realigning into a dual track configuration at Los Angeles and Temple Streets. The alignment then heads east until the connection with the Metro Gold Line at Temple and Alameda Streets. In this alignment, 2nd St. between Los Angeles St. and Hill St. is transformed into a transit mall.

Underground Emphasis LRT Alternative

The Underground Emphasis LRT Alternative is 1.58 miles long and is proposed to use a bore tunneling construction technique. The estimated capital cost of this alternative is $910.4 million in FY2008 constant dollars, or $1.167 billion in YOE dollars, inclusive of inflation.

The Underground Emphasis LRT Alternative has a total of three stations, all underground. One station is under Flower St. between 4th and 5th Streets. A second station is located underneath the Grand Avenue Project development, and a third station is under 2nd St. between Main and Los Angeles Streets.

As shown in Figure 5-3, the alignment for the Underground Emphasis LRT Alternative begins at the existing underground 7th St./Metro Center Station and heads north under Flower St. It then turns northeast under the Grand Avenue Project development and heads east beneath the 2nd St. tunnel. The alignment continues east under 2nd St. until Central Ave., then it turns northeast under private property and rises through a new portal to the surface. The alignment then crosses the intersection of 1st St. and Alameda St. at grade to join the Metro Gold Line Eastside Extension tracks.

Based on the above descriptions, Table 5-1 summarizes the key alignment characteristics of the build alternatives. As shown in the table, the Underground Emphasis LRT Alternative is approximately 1,000 feet shorter than the At-Grade Emphasis LRT Alternative, with all of its alignment in bored tunnel underground. While the two At-Grade Emphasis LRT Alternative options are similar in length, Option A has a larger share its alignment in cut-and-cover underground and one more station underground compared to Option B.

Table 5-1 Key Alignment Characteristics of the Build Alternatives						
	At-Grade Emphasis LRT Alternative – Option A		At-Grade Emphasis LRT Alternative – Option B		Underground Emphasis LRT Alternative	
Alignment	Feet	%	Feet	%	Feet	%
At-Grade	4,830	51%	5,520	58%	-	0%
Couplet	1,900	20%	1,900	20%	-	0%
Underground	2,790	29%	2,030	21%	8,342	100%
Total Feet	9,520		9,450		8,342

At-Grade	1		2		0	
Underground	2		1		3	

5.2 Capital Costs

5.2.1 Capital Costs of the Alternatives

This section describes the capital costs of the alternatives. As shown in Table 5-2, capital costs are presented in 2008 constant dollars and in Year of Expenditure dollars inclusive of inflation. The capital costs of the alternatives range from $62.7 million ($73.5 million in YOE dollars) for the TSM Alternative to $910.4 million ($1,166.9 million in YOE dollars) for the Underground Emphasis LRT Alternative. At this stage of project development, a conceptual implementation plan has been assumed for the build alternatives, whereby all cost categories are assumed to be incurred over a ten-year implementation period. In future iterations of the financial analysis, the costs and implementation schedule will be refined.

Table 5-2 Capital Costs in 2008 Dollars and YOE Dollars ($ millions)		
Alternative	2008 Dollars	YOE Dollars
TSM	$62.74	$73.51
At-Grade Emphasis LRT Alternative Option A	$795.67	$1,019.91
At-Grade Emphasis LRT Alternative Option B	$709.30	$909.17
Underground Emphasis LRT Alternative	$910.36	$1,166.91

Table 5-3 and Figure 5-4 present the capital costs of the alternatives using the FTA's Standard Cost Categories. FTA requires submission of capital costs in the SCC format at key milestones in the major capital project development process, including the application to enter Preliminary Engineering which follows the AA. The ten main cost categories are:

- 10 Guideway and Track Elements
- 20 Stations, Stops, Terminals, Intermodal
- 30 Support Facilities: Yards, Shops, Administration Buildings
- 40 Sitework and Special Conditions (removal of structures or existing trackwork, utility relocations, roadway modifications, and environmental mitigation)
- 50 Systems (overhead catenaries and communication infrastructure)
- 60 Row, Land, Existing Improvements
- 70 Vehicles
- 80 Professional Services
- 90 Unallocated Contingency
- 100 Finance Charges

Cost categories 10 through 60 are the construction and right-of-way elements associated with each alternative. Category 70 is the cost of vehicles and includes buses (TSM Alternative) and/or light rail vehicles (build alternatives). Categories 80 through 100 represent "soft costs." These costs include allowances for professional services (Category 80) such as engineering and design, construction management, agency program management, project management oversight, project implementation, and training/start-up/testing. The allowances are computed by applying a percentage to the total construction cost estimated for each cost category (Categories 10 through 50). Unallocated contingency (Category 90) is an overall project contingency which is typically higher during the early stage of project development and decreases as more detailed planning and engineering is completed. Finally, finance charges are estimated if the financial plan for the project includes the issuance of bonds. No financing charges have been assumed at this time.

Costs for each alternative are shown in Table 5-3 and Figure 5-1, and explained below.

Table 5-3 Capital Costs of the Alternatives, by FTA Standard Cost Category (2008 $, in millions)

FTA Standard Cost Categories	TSM	Build Alternatives: At-Grade Emphasis LRT Alternative-Option A	Build Alternatives: At-Grade Emphasis LRT Alternative-Option B	Build Alternatives: Underground Emphasis LRT Alternative
10 Guideway and Track Elements		$215.59	$204.64	$231.02
20 Stations, Stops, Terminals, Etc.		$82.75	$44.75	$116.27
30 Support Facilities	$21.00	$15.60	$15.60	$5.20
40 Sitework and Special Conditions		$154.87	$144.87	$184.91
50 Systems		$32.61	$32.52	$30.92
60 ROW, Land, Existing		$3.78	$3.78	$54.18
70 Vehicles	$29.11	$52.67	$52.67	$17.56
80 Professional Services	$6.93	$165.47	$145.99	$187.54
90 Unallocated Contingency	$5.70	$72.33	$64.48	$82.76
100 Finance Charges				
Total	**$62.74**	**$795.67**	**$709.30**	**$910.36**

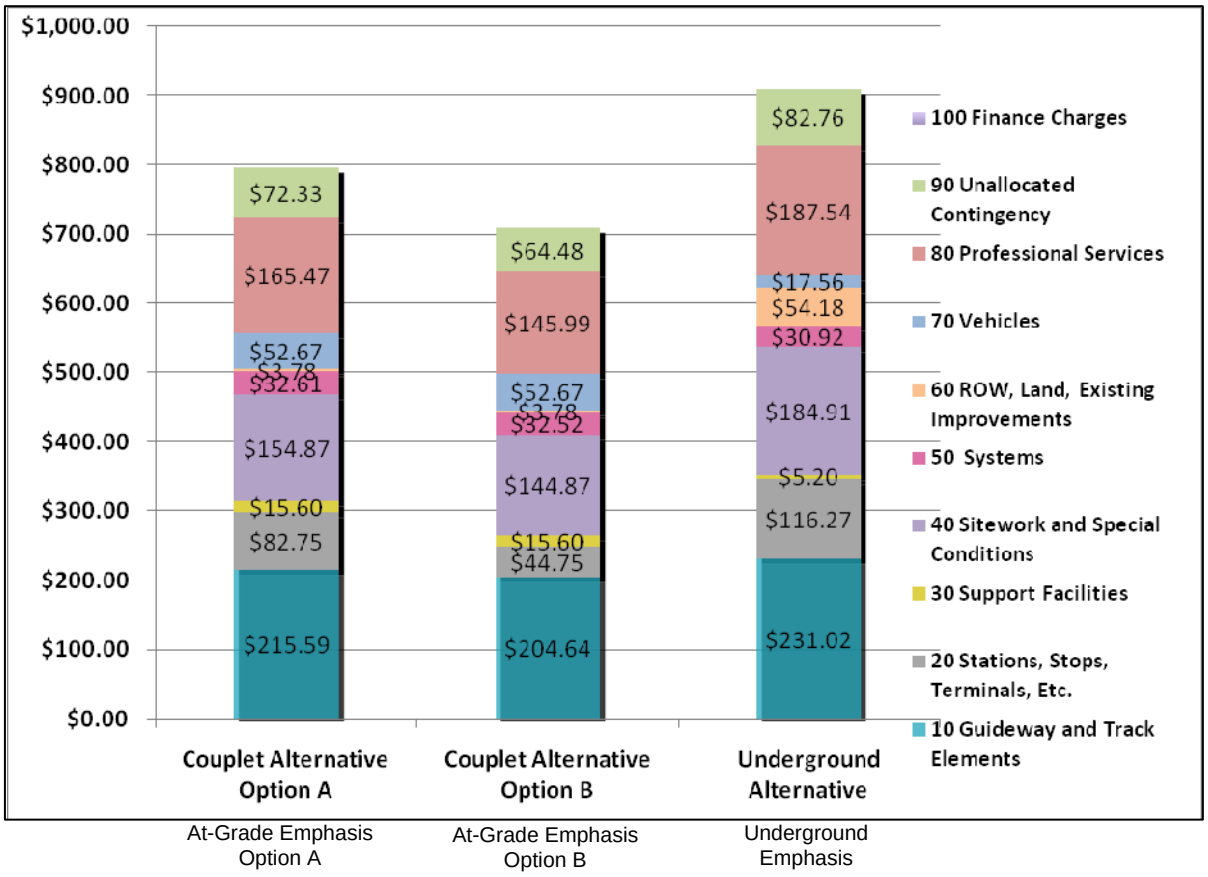

Figure 5-1 Capital Costs of the Alternatives, by Standard Cost Category(2008 $, in millions)

TSM Alternative

Of the $62.7 million cost of this alternative, approximately $50.1 million (80 percent) is for support facilities (33 percent) and vehicles (46 percent). This reflects the need for a new maintenance facility and a total of 42 new buses for this alternative. Professional services account for approximately $6.9 million (11 percent), with $5.7 million (9 percent) for unallocated contingencies.

At-Grade Emphasis LRT Alternative Option A

Of the $795.7 million cost of this alternative, approximately $501.5 million (63 percent) is related to the construction elements of the FTA SCC, with guideway and track (27 percent), sitework and special conditions (19 percent) and stations (10 percent) accounting for the majority of the construction costs. Twelve light rail vehicles would be required for this alternative which is $52.7 million (7 percent) of the total costs. Professional services account for $165.5 million (21 percent), with $72.3 million (9 percent) for unallocated contingencies.

At-Grade Emphasis LRT Alternative Option B

Similar to Option A, of the $709,3 million cost of this alternative, approximately $442.4 million (62 percent) is related to the construction elements of the FTA SCC, with guideway and track (29 percent), sitework and special conditions (20 percent) and stations (6 percent) accounting for the majority of the construction costs. Station costs are lower with Option B since only one station is underground compared to two in Option A. Similar to Option A, 12 light rail vehicles would be required for this alternative at a cost of $52.7 million (7 percent of the total costs). Professional services account for $146.0 million (21 percent), with $64.5 million (9 percent) for unallocated contingencies.

Underground Emphasis LRT Alternative

Of the $910.4 million cost of this alternative, $568.3 million (62 percent) is related to the construction elements of the FTA SCC, with guideway and track (25 percent), sitework and special conditions (20 percent) and stations (13 percent) accounting for the majority of the construction costs. Compared to the At-Grade Emphasis LRT Alternative, only four light rail vehicles would be required for this alternative which is $17.6 million (2 percent of total costs). Professional services account for $187.5 (21 percent), with $82.8 million (9 percent) for unallocated contingencies.

5.2.2 Year of Expenditure Cost Analysis

For the YOE cost analysis, capital costs were escalated from 2008 dollars using annual growth rates and a preliminary implementation plan developed by other team members. The annual and compound growth rates are shown in Table 5-4. In addition to these escalation rates, the percentage of project completion by year (cost curve) shown in Table 5-5 was used to estimate the annual costs for the TSM and the build alternatives.

Table 5-4 Year of Expenditure Dollar Escalation Rates		
Capital Costs	Growth Rate	Compound Annual Growth Rate
2009	1.04	1.04
2010	1.04	1.08
2011	1.04	1.12
2012	1.04	1.17
2013	1.04	1.22
2014	1.04	1.27
2015	1.03	1.30
2016	1.03	1.34
2017	1.03	1.38
2018	1.03	1.42

Table 5-5 Cost Curve Assumptions		
	Assumed Cost Curves	
Year	TSM Alternative	Build Alternatives
2009	14.3%	1.6%
2010	14.3%	2.4%
2011	14.3%	3.2%
2012	14.3%	12.0%
2013	14.3%	13.6%
2014	14.3%	14.4%
2015	14.3%	15.2%
2016		15.2%
2017		14.4%
2018		8.0%

Table 5-2, shown previously, compares the total costs for each build alternative in 2008 dollars and in YOE dollars. Table 5-6 and Figure 5-2 provide a comparison of the alternatives with respect to costs incurred per year in YOE dollars. As shown in the tables and figure, the major expenditures for the build alternatives are assumed to occur in years 4 through 9 of the 10-year project implementation period, while the costs of the TSM Alternative are assumed to be incurred over the first 7 years.

Table 5-6 Comparison of Annual Capital Costs (YOE$, in millions)				
Year	TSM Alternative	Couplet Alternative-Option A	Couplet Alternative-Option B	Underground Alternative
2009	$9,321	$13,240	$11,803	$15,148
2010	$9,694	$20,654	$18,412	$23,631
2011	$10,082	$28,641	$25,532	$32,769
2012	$10,485	$111,699	$99,574	$127,799
2013	$10,905	$131,656	$117,365	$150,632
2014	$11,341	$144,977	$129,239	$165,872
2015	$11,681	$157,622	$140,512	$180,340
2016	$0	$162,350	$144,727	$185,750
2017	$0	$158,420	$141,223	$181,253
2018	$0	$90,651	$80,811	$103,717
Total	**$73,510**	**$1,019,910**	**$909,197**	**$1,166,911**

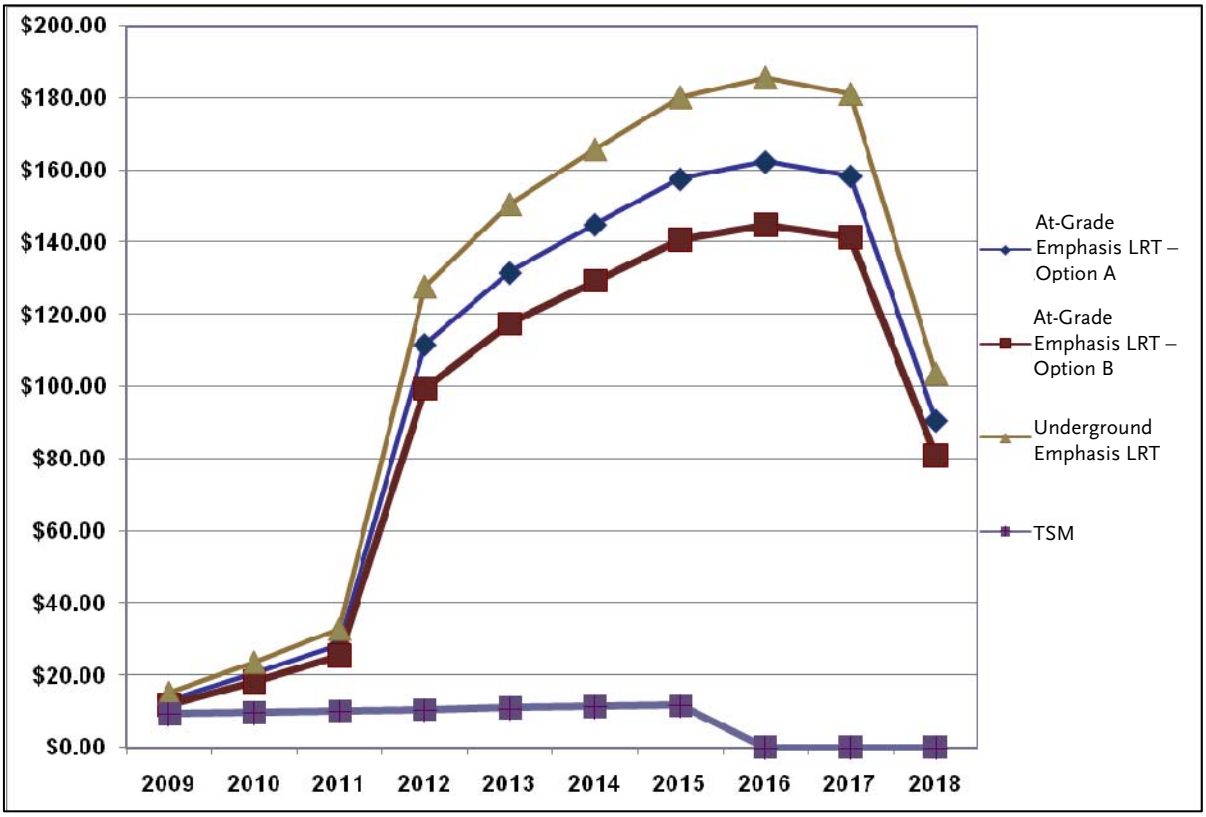

Figure 5-2 Annual Capital Costs by Alternative (YOE dollars, in millions)

5.3 Potential Capital Revenue Sources

This analysis identifies potential funding sources and financing strategies to fund the capital costs of the TSM and build alternatives. As shown in Table 5-7, the preliminary assumption is that the TSM and build alternatives would be funded 50 percent from federal sources and 50 percent from local sources. However, as the project development process continues and a locally preferred alternative is selected, these funding split assumptions may change, as may the funding sources proposed.

Table 5-7 Preliminary Funding Assumptions

Funding Source	TSM Alternative	Build Alternatives
Federal	50%	50%
State	0%	0%
Local	50%	50%

The subsequent sections provide a description of the conceptually proposed federal and local funding sources identified at this stage of project development. This is followed by descriptions of other potential state and local funding sources that could be examined in greater detail in future iterations of the financial analysis.

5.3.1 Conceptually Proposed Funding Sources

The federal and local/state funding sources conceptually proposed for the TSM and build alternatives are:

Federal:

- FTA Section 5309 New Starts (for the build alternatives);
- FTA Section 5309 Bus Discretionary (for the TSM Alternative); and
- Congestion Mitigation and Air Quality (CMAQ).

Local/State:

- Proposed New Countywide Transportation Sales Tax;
- Proposition A and Proposition C Countywide Transportation Sales Taxes (if restrictions on expenditure for subway construction were removed); and
- Regional Improvement Program (RIP).

5.3.1.1 Conceptually Proposed Federal Sources

FTA Section 5309 New Starts Program

The most viable federal funding source for the build alternatives is the FTA New Starts program. The New Starts program is the federal government's primary financial resource for supporting locally-planned, implemented, and operated transit fixed guideway capital investments, such as the build alternatives identified for the project. Since the TSM

Alternative does not include a fixed guideway element, it would not be eligible for New Starts funds.

Projects applying for New Starts funding must undergo evaluation by the FTA throughout the entire project development process. Projects are evaluated according to a variety of criteria such as mobility improvements, environmental benefits, cost-effectiveness, operating efficiencies, transit supportive land use, and local financial capacity. At this stage of project development, FTA's New Starts program is proposed to provide 50 percent of the total funding for the project.

According to Metro's 2008 LRTP, the agency anticipates receiving between $80-$100 million dollars a year in New Starts funds for a variety of planned fixed guideway projects. The projects identified in the LRTP to receive New Starts Funds are the:

- Eastside Light Rail Project;
- Exposition Phase II to Santa Monica; and
- Crenshaw Transit Corridor.

Metro has a successful history of obtaining New Starts funds, including the Red Line and the Eastside Light Rail Project, which received a Full Funding Grant Agreement in the amount of $490.7 million in June 2004.

Metro's LRTP assumes that after the $490.7 million is received for the Eastside Light Rail Project, the agency will receive approximately $80 million per year through FY 2025. As stated above, these funds are currently planned to be used on the Exposition Phase II to Santa Monica and the Crenshaw Transit Corridor projects, with the Regional Connector Transit Corridor not currently identified.

Beyond 2025, Metro staff have determined that no local funds will be available to provide match for federal New Starts funds. According to the LRTP, if in the future local matching funds become available, Metro will evaluate and select future capital projects to be included into the New Starts applications.

Assuming that Metro will have additional New Starts funds available for the Regional Connector's build alternatives in the near future, a 50 percent share would require the following total funding amounts.

- At-Grade Emphasis LRT Alternative – Option A: $509.9 million
- At-Grade Emphasis LRT Alternative – Option B: $454.59 million
- Underground Emphasis LRT Alternative: $583.45 million

Since the Eastside, Exposition, and Crenshaw projects currently have a higher priority than the Regional Connector, the timing for receipt of the New Starts funds could likely be at the end of the project's construction period. If this is the case, Metro would have to use local funds to cover FTA shares and be paid back when New Starts funds are available. Analysis of this issue will be addressed in future iterations of the financial analysis.

FTA Section 5309 Bus Discretionary Program

The Section 5309 Bus Discretionary Program allocates grants on an annual basis primarily through Congressional earmarks. Eligible purposes are acquisition of buses for fleet and service expansion, bus maintenance and administrative facilities, transfer facilities, bus malls, transportation centers, intermodal terminals, park-and-ride stations, acquisition of replacement vehicles, bus rebuilds, bus preventive maintenance, passenger amenities such as passenger shelters and bus stop signs, accessory and miscellaneous equipment such as mobile radio units, supervisory vehicles, fareboxes, computers, shop and garage equipment, and costs incurred in arranging innovative financing for eligible projects. Grants are typically provided in the form of an 80 percent federal and 20 percent local match. The primary components of the TSM Alternative, buses and a new maintenance facility, would be eligible for federal funding under this program.

Congestion Mitigation and Air Quality Program

The CMAQ program is a federal formula grant program for use on projects that contribute to attainment of national ambient air quality standards. Within the 2008 LRTP, Metro has programmed CMAQ funds for new transit lines including Eastside, Exposition Light Rail Line Phases I and II, Crenshaw Transit Corridor and for the first three years of operation of various Metro Rapid bus projects.

While the deadline for compliance with federal air quality standards is 2020, Metro has programmed declining levels of CMAQ funds through 2030 within the 2008 LRTP. The Regional Connector would qualify for CMAQ funding as a project that would contribute to attainment of national ambient air quality standards and reduce congestion.

5.3.1.2 Conceptually Proposed Local/State Funding Sources

Los Angeles Countywide Sales Taxes for Transportation

Currently there are two existing countywide transportation sales taxes in Los Angeles County – Proposition A and Proposition C. However, the 1998 Reform and Accountability Act restricts the use of Proposition A and C funds to construct underground subways. In order to use these funds for the build alternatives, this restriction would need to be removed.

Proposition A

Proposition A is a county-wide half-cent sales tax that was passed in 1980. This voter-approved sales tax is used to improve and expand public transportation throughout Los Angeles County. Proposition A funds are allocated among four funding programs: Local Return Program (25 percent), Rail Development Program (35 percent), Discretionary Program (40 percent), and the 5 percent of 40 percent Incentive Program. The build alternatives would likely only be eligible for one of these programs, the Rail Development

program. The TSM Alternative would be eligible under the Local Return and Discretionary programs. Neither the build alternatives nor the TSM Alternative would be eligible under the 5 percent of 40 percent Incentive Program, as this is for paratransit and special transit programs.

Rail Development Program: For previous major construction projects, such as the Blue, Green and Red Lines, Metro has leveraged these funds by bonding in accordance with the agency's adopted debt policy. Bond debt service has the first claim of funds from this program. Other eligible uses include the acquisition, renovation, rehabilitation, and replacement of rail vehicles, rail facilities, and wayside systems, operation of rail systems, and acquisition and maintenance of rights of way.

Local Return Program: Funds from this program are distributed to Los Angeles County and the cities in the County on a per capita basis for public transit uses. These funds may be traded to other jurisdictions in exchange for general or other funds if the traded funds are used for public transit purposes. Eligible uses include expenditures related to fixed route and paratransit services, Transportation Demand Management (TDM), Transportation System Management (TSM), and fare subsidy programs that exclusively benefit transit.

Discretionary: These funds are allocated based on Metro Board policy for County bus operators by formula based on projected receipts plus CPI, and adjusted once during the mid-year reallocation. Eligible uses include any transit purpose, however current practice limits expenditures to bus capital and operations.

Proposition C

Proposition C is a county-wide half-cent sales tax that was passed in 1990. This voter-approved sales tax is used for public transit purposes throughout Los Angeles County. Proposition C funds are allocated among five funding programs: Rail and Bus Security (5 percent), Commuter Rail/Transit Centers (10 percent), Local Returns (20 percent), Transit-related Improvements to Freeways and State Highways and Public Mass Transit Improvements to Railroad Rights-of-Way (25 percent) and Discretionary program (40 percent). The build alternatives would likely only be eligible for one of these programs, the Discretionary program. The TSM Alternative would be eligible for funds from the Discretionary and Local Returns programs.

Discretionary Program: Funds from this program are currently allocated at the discretion of Metro Board to Metro and non-Metro operators and agencies after all other funding opportunities are exhausted. Eligible uses include the improvement and expansion of rail and bus transit countywide, provision of fare subsidies, increased graffiti prevention and removal, and increased energy-efficient, low polluting public transit service. These funds may also be used for Metro's Call for Projects and other regionally significant transit programs at discretion of Metro Board.

Local Returns Program: These funds are distributed to cities on a per capita basis exclusively for public transit purposes. Unlike the Proposition A Local Returns program, these funds may not be traded to other jurisdictions in exchange for general or other funds. Eligible uses include expenditures related to fixed route and paratransit services, Transportation Demand Management (TDM), Transportation System Management (TSM), fare subsidy programs that exclusively benefit transit, Congestion Management Programs, commuter bikeways and bike lanes, street improvements supporting public transit service, and Pavement Management System projects.

Regional Improvement Program (RIP)

The State's funding for transportation is programmed in the State Transportation Improvement Program (STIP). Within the STIP, 75 percent of the funding is allocated and programmed by the regional transportation planning agencies such as Metro under the Regional Improvement Program (RIP). The remaining 25 percent is programmed by the State under the Interregional Improvement Program. The actual sources of RIP funding are the federal Surface Transportation Program (STP) and the State's Public Transportation Account (PTA). PTA revenues accrue from a sales tax on gasoline and diesel fuel, with revenues used for transit.

Based on a fund estimate prepared by Caltrans, the California Transportation Commission develops the annual RIP programming targets for each agency. Metro selects and programs the projects to be funded through its Call for Projects process and the Metro Long and Short Range Transportation Plans. Metro has programmed and re-programmed its STIP projects to conform to the targets, which have been subject to change based on level of funds available and the extent of borrowing of PTA revenues by the State for use in balancing the State Budget. Future RIP revenues could potentially be used to assist in funding the Regional Connector.

5.3.2 Other Potential Funding Sources

As the project moves forward, the following sources may become viable revenue sources for the alternatives. These potential sources described below include one state source and five local sources.

5.3.2.1 Potential State Source

At this stage of project development, five other potential local funding sources have been identified. While these sources may provide funding in the future, they should be considered as minor supportive sources as they would generate a much smaller revenue stream than the county-wide sales taxes and RIP funding described previously.

Benefit Assessment District Revenues

Under a benefit assessment district, a fee is placed on properties in a specified area to pay part or all of the cost of specific capital improvements made within and specifically benefiting that area. The underlying principle for the creation of benefit assessment districts is that owners of property located within close proximity to a particular public asset, such as a rail transit station, derive benefits from the presence of that asset and, therefore, should share in the costs of its construction, maintenance, operation, and/or

upgrading. In a benefit assessment district, a connection between benefit received and cost charged is essential, in that assessments charged should be proportional to and no greater than the benefit received by the assessed property.

In July 1985, Metro established two benefit assessment districts as part of the funding plan for Segment 1 of the Red Line. The districts, referred to as District A1 and A2, were formed in advance of the initiation of service in 1993. Annual assessments were levied on the gross square footage of the assessable improvement or parcel area of non-residential properties. For District A1, the 2007-2008 assessment rate is $0.33 while the assessment rate for District A2 is $0.32.

Funding from the two benefit assessment districts provided approximately $130.0 million or 9 percent of the Red Line's total costs. The $130.0 million was in the form of bond proceeds to support the construction of stations in each district. The benefit assessment districts have provided the revenue stream to repay the bonds. The final assessment fee was collected in April 2009 with the final bond payment scheduled for September 2009.

At the time the two existing benefit assessment districts were formed, Metro was not required to conduct an election in order to levy an assessment on property owners. With passage of State Proposition 218 in 1996, new assessment districts require approval by a two-thirds vote of property owners. The 2008 LRTP assumes no future funding from benefit assessment districts.

While the existing benefit assessments are expiring, it is of interest to note the considerable overlap between these districts and the PSA boundaries. For this reason, a description of the two districts is provided below.

District A1 – Central Business District: District A1 covers approximately 1,205 acres and includes Bunker Hill, the Civic Center portions of Chinatown, Little Tokyo and the Financial District areas of downtown Los Angeles. This district includes four Red Line stations, Union Station, Tom Bradley Civic Center Station, Pershing Square Station and 7th St./Metro Center Station. The benefit assessment district boundaries were set at a one-half mile distance from the station locations. Within the District A1's one-half mile boundaries there are approximately 2,700 properties, of which 1,250 properties are assessable and contain 63.2 million square feet. Bonds in the amount of $123.5 million were issued for this assessment district to support the construction of the four stations.

District A2 – Westlake/MacArthur Park District: District A2 is located on Wilshire Blvd., midway between Miracle Mile to the west and the Los Angeles Central Business District to the east. The district reflects a one-third mile boundary around one Red Line station, Westlake/MacArthur Park Station, and covers approximately 207 acres. Within the district there are approximately 460 properties of which 230 are assessable and contain 3.3 million square feet. Bonds in the amount of $6.5 million were issued for this assessment district to support the construction of the station.

Joint Development Proceeds

Metro has a long, successful history of joint development projects along its major transit corridors. According to Metro's Joint Development Policies and Procedures document, joint development is a real property asset development and management program designed to secure the most appropriate private and/or public sector development on Metro-owned property at and adjacent to transit stations and corridors. Joint Development also includes coordination with local jurisdictions in station area land use planning in the interest of establishing development patterns that enhance transit use.

The goals of Metro's Joint Development Program include:

- Encouraging comprehensive planning and development around station sites and along transit corridors; and
- Reducing auto use and congestion through encouragement of transit-linked development.

For the specific sites, the Metro's Joint Development Program seeks developments that

- Promote and enhance transit ridership;
- Enhance and protect the transportation corridor and its environs;
- Enhance the land use and economic development goals of surrounding communities and conform to local and regional development plans; and
- Generate value to the MTA based on a fair market return on public investment.

Table 5-8 summarizes the current status of Metro's Joint Development Program. The table includes completed projects, projects under construction, projects that have been approved by Metro's Board, and potential future joint development sites. Additional joint development sites could potentially be identified for the Regional Connector.

Mello-Roos District Revenues

The Mello-Roos Community Facilities Act of 1982, Gov. Code §§ 53311 ff. provides an alternative method of financing certain public capital facilities and services, especially in developing areas and areas undergoing rehabilitation. A local legislative body may create a Mello-Roos Community Facilities District (or "CFD") within defined boundaries to finance a broad range of facilities and services, including the purchase, construction, expansion, improvement, or rehabilitation of any real or other tangible property with an expected useful life of 5 years or longer which the agency conducting the proceedings is authorized by law to construct, own, or operate, or to which it may contribute revenue. The CFD may impose a "special tax" within the boundaries of the CFD, which requires a two-thirds vote of registered voters (if the district is developed). If the vote passes, a "Notice of Special Tax Lien" is recorded which imposes a continuing lien on affected properties. CFD's may issue bonds secured by the special tax.

Table 5-8 Metro Joint Development Project Status	
Joint Development Projects	Development Summary
Completed Projects	
Union Station Gateway, 1995	• 600k Square foot Metro headquarters building • 11 Bay Patsaouras Plaza • Union Station East Portal • 2,800 space below-grade parking garage • Space for additional 2 million square feet of commercial/retail
7th St./Metro Center Station, 1993	• Station in basement of a 550k square foot office tower
Metro Blue Line Willow Station, 1999	• 528k square foot site • 132k net rentable square feet of neighborhood shopping • Major grocery store, retail and food services facilities • 700- car transit parking structure
Metro Red Line Hollywood/Highland Station, 2001	• 389k square feet of retail/entertainment • 3,500 seat Kodak Theater • 640-room Renaissance Hollywood Hotel • 3,000-space parking structure
Metro Red Line Hollywood/Western Station, 2004	• 60 affordable housing units and retail • 9k square foot retail • 4k square foot child care center
Wilshire and Vermont, 2008	• 380 residential units • 26k square feet of commercial space • Child care center • 800 student middle school • 700 space parking structure
Projects in Construction	
Hollywood-Vine	• 300 room W Hotel • 150 W branded condos integrated with hotel • 350 apartments • 72k square feet street level retail • bus layover facility
Wilshire-Western	• 195 Condominiums • 49k square feet retail/restaurant • 700 space parking • bus layover facility with 12 spaces
Projects with Board Approval	
Westlake-MacArthur Park	• 310 affordable housing units • 86k square feet of retail • 483 space parking structure
Potential Sites	
North Hollywood	17.4 Acre 4 parcel potential site
Universal City	12 Acre 2 parcel potential site
Metro Orange Line Sepulveda Station	12.48 Acre 1 parcel potential site
Chatsworth Metrolink Station	12 Acre 2 parcel potential site

Table 5-8 Metro Joint Development Project Status	
Joint Development Projects	Development Summary
Metro Gold Line Eastern Extension	Various Parcel potential site
Taylor Yard	23 Acre 1 parcel potential site
Blue Line Artesia Station Bus Divisions (Div. 7; El Monte)	6.4 Acre potential site
Metro Orange Line Balboa Station	2.2 Acre potential site
Vermont/Beverly	.5 Acre potential site
Vermont/Sunset	.7 Acre potential site

Currently transit capital and operating expenses are not eligible to receive funding from Mello-Roos Districts. In the spring 2008, the Mello-Roos Act and Public Transit (AB 2705) was submitted which would authorize the use of Mello-Roos Community Facilities Districts to finance public transit facilities and operating expenses in new developments. In future iterations of the financial analysis, this pending legislation will be reviewed and further evaluated for potential applicability to the project.

Revenue from Potential Congestion Pricing Strategies

Congestion pricing is the concept of charging for the use of a transportation facility, such as a roadway, based on the level of traffic congestion. The greater the level of congestion, usually occurring during morning and evening rush hours, the higher the cost (tolls) to use the facility.

It is assumed that revenues generated by the tolls would be used first to pay for the operations of the priced lanes and any outstanding debt associated with implementing congestion pricing in a corridor. After paying these expenses, any additional revenues generated from the tolls could be used to improve or enhance transportation services in the corridor where the toll is generated. These enhancements may include additional bus and rail services, roadway improvements, and other complementary services.

Los Angeles County was recently selected to implement a one-year congestion pricing demonstration project under a United States Department of Transportation funding program. The project, called FastLanes, will test innovative pricing strategies to alleviate congestion, maximize freeway capacity usage, and fund additional transit alternatives on High Occupancy Vehicle (HOV) lanes on I-110 between 182nd St./Artesia Transit Center and Adams Blvd. and on I-10 between Alameda St./Union Station and I-605.

Revenue from Potential Countywide Transportation Impact/ Mitigation Fee

Transportation impact fees are charges assessed by local governments against new development projects that attempt to recover the cost incurred by government in providing the public facilities required to serve the new development. Impact fees are typically only used to fund facilities that are directly associated with the new development. While transportation impact fees may be used to pay the proportionate share of the cost of public facilities that benefit the new development, the fees usually cannot be used to

correct existing deficiencies in public facilities. Revenue from the impact fees could be pledged for payment of annual debt service to implement the improvement project.

Metro is currently conducting a Countywide Congestion Mitigation Fee Study which has the following primary objectives:

- Establish a regional mitigation program by meeting regional mitigation requirements under Metro's Congestion Mitigation Program (CMP) and the California Environmental Quality Act (CEQA), replacing the existing CMP debit/credit program and ensuring the continued flow of more than $95 million annually in gas tax revenue to local governments;
- Ensure local control by allowing projects to be selected by each jurisdiction consistent with guidelines, allowing fees to be collected separately by each jurisdiction, and allowing fees to be deposited in separate interest-generating accounts;
- Generate new revenue for unmet transportation needs; and
- Provide a level playing field county-wide.

Results from the study indicate that implementation of mitigation fees could generate between $2 and $15 billion in funding for transportation projects over the 2005 to 2030 period, depending upon the fee imposed. Although Metro is developing and overseeing this program, the cities would have the control to implement the program on a local level. Additionally, the study recommends establishing an advisory committee to oversee the program's implementation and assist in guiding the program's recommendations.

5.3.3 Potential Financing Strategies

This section describes two potential funding strategies that could be evaluated in detail during future iterations of the financial analysis.

Metro Bonding Capacity

Metro leverages a portion of its revenues from Proposition A and Proposition C county-wide sales taxes for use in paying the debt service on bonds issued to support bus, rail, and highway capital projects. Within the 2008 LRTP, the agency's long range financial plan calls for Metro to modify its current debt policy by increasing the percentage of cash to be used for debt as opposed to using it on a pay as you go basis. Specifically, the LRTP assumes increasing the percent of revenue available for debt service within the following funding programs:

- Proposition C 25 Percent Funds (Transit-related Improvements to Freeways and State Highways and Public Mass Transit Improvements to Railroad Rights-of-Way program): from 60 percent to 75 percent; and
- Proposition C 10 Percent Funds (Commuter Rail/Transit Centers program): from 40 percent to 50 percent.

Project Packaging for FTA New Starts Process

Transit agencies across the country are identifying alternative project delivery strategies to implement major capital projects faster. In both Houston and Salt Lake City, the transit agencies have been successful in reaching an agreement with FTA to submit a package of fixed guideway projects that would have a portion of the projects funded entirely with local sources and the remainder of the projects funded jointly between the federal government and the local agency. For example, the Utah Transit Authority (UTA) has entered into a Memorandum of Understanding (MOU) with the FTA for the FrontLines 2015 Program. According to the MOU, the overall funding split for the $2.5 billion five-corridor program will be 20 percent federal and 80 percent local. However, for the two highest performing projects FTA has agreed to an 80 percent federal and 20 percent local funding split. For the remaining three projects in the FrontLines Program, UTA will use 100 percent local funds with the majority of this funding provided through the issuance of bonds.

It's important to note that in order for this approach to be successful there would need to be enabling language included in the SAFETEA-LU reauthorization bill and a successful negotiation of an MOU with the FTA.

5.4 Operations and Maintenance (O&M) Costs and Revenues

5.4.1 O & M Costs

System-wide O&M cost estimates were developed for each of the alternatives and reflect operating plans for the year 2030. For this report, costs are shown in 2008 dollars. In future versions of the financial analysis, O&M costs will be shown in YOE dollars and will be included in a detailed cash flow analysis.

Table 5-9 summarizes the total annual cost by mode for each alternative. Table 5-10 compares the change in annual O&M costs relative to the No Build Alternative, while Table 5-11 compares the change in costs relative to the TSM Alternative. Key findings from these comparisons are described below.

In comparison to the No Build Alternative:

- The Underground Emphasis LRT Alternative has the lowest annual increase in O&M cost ($5.1 million), followed by the At-Grade Emphasis LRT Alternative ($9.6 – $9.8 million). The TSM Alternative has the largest increase in annual O&M costs ($13.6 million) due to the significant increase in bus service and relatively small savings in heavy rail and light rail costs (less than $100,000).

In comparison to the TSM Alternative:

- The Underground Emphasis LRT Alternative has the lowest annual increase in O&M cost and provides the largest annual savings (approximately $8.5 million savings).

- The annual O&M costs of the At-Grade Emphasis LRT Alternative are lower than the TSM Alternative. Option A has a savings of $3.8 million, while Option B has a savings of $4.1 million.

In comparison within/to the At-Grade Emphasis LRT Alternatives:

- At-Grade Emphasis LRT Alternative - Option B annual O&M costs were slightly lower than Option A (approximately $0.25 million less).
- The annual O&M cost of the Underground Emphasis LRT Alternative is approximately $4.5 million lower than the At-Grade Emphasis LRT Alternative.

Table 5-9 2030 Annual Operating Cost of the Alternatives
(in 2008 $, Millions)

Mode	No Build Alternative	TSM Alternative	Couplet Alternative-Option A	Couplet Alternative-Option B	Underground Alternative
Heavy Rail	$117.09	$117.06	$116.30	$116.26	$116.11
Light Rail	$258.01	$257.95	$268.61	$268.42	$264.20
Bus Including BRT	$987.92	$1,001.61	$987.91	$987.88	$987.87
System-wide Total	**$1,363.02**	**$1,376.62**	**$1,372.82**	**$1,372.57**	**$1,368.17**

Table 5-10 Comparison of 2030 Annual Operating Costs to the No Build Alternative
(in 2008 $, Millions)

Mode	No Build Alternative	TSM Alternative	Couplet Alternative-Option A	Couplet Alternative-Option B	Underground Alternative
Heavy Rail	-	-$0.03	-$0.79	-$0.83	-$0.98
Light Rail	-	-$0.06	$10.60	$10.41	$6.19
Bus/BRT	-	$13.69	-$0.01	-$0.04	-$0.05
System-Wide Total	-	$13.60	$9.80	$9.55	$5.15

Table 5-11 Comparison of 2030 Annual Operating Costs to the TSM Alternative (in 2008 $, Millions)					
Mode	No Build Alternative	TSM Alternative	Couplet Alternative Option A	Couplet Alternative Option B	Underground Alternative
Heavy Rail	N/A	-	-$0.76	-$0.80	-$0.95
Light Rail	N/A	-	$10.66	$10.47	$6.25
Bus/BRT	N/A	-	-$13.70	-$13.73	-$13.75
System-Wide Total	N/A	-	-$3.80	-$4.05	-$8.45

5.4.2 O & M Revenue Sources

The sections below describe preliminary estimates of farebox revenue, farebox recovery rates, and levels of annual system-wide operating support associated with the alternatives.

5.4.2.1 Farebox Revenues and Farebox Recovery

Table 5-12 summarizes the annual system-wide farebox revenues and farebox recovery rates of the alternatives for the 2030 horizon year. Annual estimates of 2030 farebox revenues were developed based on the travel forecasting model projections of 2030 total daily linked trips by alternative and Metro's 2007 average fare revenue per linked trip. Total daily linked trips were annualized using an annualization factor of 317.39, consistent with the factor used in calculation of user benefits. The resulting annual numbers of system-wide linked trips are shown in the table below. Annual farebox revenues were then estimated assuming Metro's 2007 average linked trip fare of $0.66. This average fare reflects Metro's most recent fare increase and the current level of use of discounted fare media and programs.

As shown in the table, annual system-wide farebox revenues for the 2030 horizon year are projected to range from $317.5 million for the No Build Alternative to $319.7 million for the Underground Emphasis LRT Alternative. Relative to the annual system-wide O&M costs projected for the 2030 horizon year, farebox recovery is estimated to range from 23.1 for the TSM Alternative to 23.4 for the Underground Emphasis LRT Alternative. While the actual farebox recovery rates are preliminary, the data indicate that the Underground Emphasis LRT Alternative would generate higher levels of fare revenue and farebox recovery than the other alternatives, followed by the At-Grade Emphasis LRT Alternative.

Table 5-12 2030 Annual Farebox Revenues and Farebox Recovery by Alternative (2008 $)					
			At-Grade Emphasis LRT Alternative		
	No Build Alternative	TSM Alternative	Option A	Option B	Underground Emphasis LRT Alternative
Annual Linked Trips (millions)	481.11	481.41	483.52	483.77	484.34
Annual Farebox Revenue (2008 $, millions)	$317.53	$317.73	$319.13	$319.29	$319.67
Farebox Recovery	23.3%	23.1%	23.2%	23.3%	23.4%

5.4.2.2 Operating Support from Metro

The combined effect of lower annual system-wide O&M costs and higher farebox revenues is projected to reduce the level of annual operating support that Metro would be required to fund. Table 5-13 summarizes the reduction in annual operating support associated with the build alternatives relative to the TSM Alternative. As shown in the table, the Underground Emphasis LRT Alternative is projected to reduce the level of annual system-wide operating support required from Metro by $10.4 million. The At-Grade Emphasis Alternative is projected to reduce Metro's system-wide operating subsidy by $5.2 million to $5.6 million.

Table 5-13 2030 Reduction in Annual Operating Support Relative to the TSM Alternative (2008 $, Millions)				
		At-Grade Emphasis LRT Alternative		
	TSM Alternative	Option A	Option B	Underground Emphasis LRT
Increase in Farebox Revenues	-	$1.40	$1.56	$1.94
O&M Cost Savings	-	$3.80	$4.05	$8.45
Reduction in Operating Support	-	$5.20	$5.61	$10.39

5.5 Summary of Findings

The key findings of the financial analysis are summarized below.

- The Regional Connector is included in both of the existing long range financial planning documents for the region: Metro's 2008 Long Range Transportation Plan (LRTP) and the Southern California Association of Governments Regional Transportation Plan (SCAG RTP). Within the LRTP, the Regional Connector is the highest priority project within the Strategic Unfunded component of the plan. Projects in the Strategic Unfunded component of the plan could be implemented if additional funding were made available from new sources. With regard to the SCAG's Regional Transportation Plan, the Regional Connector is included in the financially constrained plan as a funded project (project identification number 1TR0404).

- The alternatives under consideration for the Regional Connector are the Transportation System Management (TSM) Alternative and two build alternatives, in addition to a No Build Alternative. The TSM Alternative would use buses to shuttle passengers between the 7th St./Metro Center Station and Union Station. The build alternatives would provide a continuation of existing light rail service between the two stations. The build alternatives reflect two options for a combined at-grade/cut-and-cover underground alternative that includes one-way couplets on Main St. and Los Angeles St. (At-Grade Emphasis LRT Alternative) and an alternative that is 100 percent underground bore tunnel (Underground Emphasis LRT Alternative).

- The capital costs of the Regional Connector alternatives range from $62.7 million ($73.5 million in YOE dollars) for the TSM Alternative, to $709.3 - $795.7 million ($909.2 - $1,019.9 million in YOE dollars) for At-Grade Emphasis LRT Alternative Options A and B respectively, and to $910.4 million ($1,166.9 million in YOE dollars) for the Underground Emphasis LRT Alternative. At this stage of project development, a conceptual ten year implementation plan has been assumed for the build alternatives and seven years for the TSM Alternative. In future iterations of the financial analysis, the costs and implementation schedule will be refined.

- The capital costs of the TSM and build alternatives are assumed to be funded 50 percent from federal sources and 50 percent from local/state sources. The federal and local/state funding sources conceptually proposed are:

Federal:

- FTA Section 5309 New Starts (for the build alternatives);

- FTA Section 5309 Bus Discretionary (for the TSM Alternative); and

- Congestion Mitigation and Air Quality (CMAQ).

Local/State:

- Proposed New Countywide Transportation Sales Tax;

- Proposition A and Proposition C Countywide Transportation Sales Taxes (if restrictions on expenditure for subway construction were removed for the build alternatives); and

- Regional Improvement Program (RIP).

FTA New Starts funding is proposed to total approximately $600 million ($60 million per year over the 10 year implementation period).

The build alternatives are projected to have lower system-wide operating and maintenance (O&M) costs than the TSM Alternatives. Relative to the TSM Alternative, the Underground Emphasis LRT Alternative would reduce 2030 annual O&M costs by $8.45 million. The At-Grade Emphasis Alternative Options A and B would reduce 2030 annual O&M costs by $3.80 million and $4.05 million respectively.

The build alternatives are projected to generate higher system-wide ridership and farebox revenues than the TSM Alternatives. Relative to the TSM Alternative, the Underground Emphasis LRT Alternative would increase annual farebox revenues by $1.94 million. The At-Grade Emphasis LRT Alternative Options A and B would increase annual farebox revenues by $1.40 million and $1.56 million respectively.

With the combined effect of lower system-wide O&M costs and higher farebox revenues, the build alternatives are projected to reduce the annual operating support that would be required from Metro. Relative to the TSM Alternative, the Underground Emphasis LRT Alternative would reduce Metro's annual system-wide operating subsidy by $10.39 million. The At-Grade Emphasis LRT Alternative Options A and B would reduce Metro's annual system-wide operating subsidy by $5.20 million and $5.61 million respectively.

As the alternatives selection process moves forward, future iterations of the financial analysis will be conducted, with increasing levels of detail and refinement. The refined financial analysis will include a detailed cash flow analysis in YOE dollars through the project horizon year of 2030.

Section 6 Community Outreach and Public Involvement

6.1 Understanding of Public Outreach Challenges and Opportunities

The Regional Connector is a project that brings challenges as well as opportunities to the public involvement process. While its actual design, engineering and operational impacts are focused on a relatively small area in downtown Los Angeles, its potential benefits accrue to all those served by transit throughout the entire Southern California region. Therefore, it was important to reach out not only to downtown stakeholders, including the employees, residents, tourists and businesses within the PSA, but also to those benefiting from improved system connectivity from one side of Los Angeles County to the other.

Downtown Los Angeles has undergone a transformation over the last decade from primarily a daytime employment destination to a dynamic community with a growing residential population. Established business organizations, Chambers of Commerce, Business Improvement Districts (BIDs), Neighborhood Councils, and others, provided access to stakeholders and organized groups. Through these key groups, the project team established contact and ongoing communication channels to downtown stakeholders.

It was equally important to reach out to stakeholders and commuters who could potentially benefit from the regional transit connectivity of the project. These constituents included transit users from the Metro Blue Line which begins in Long Beach, the Metro Gold Line from Pasadena and transit users who would potentially utilize public transit once the Metro Expo Line and Metro Gold Line Eastside Extension finished construction. The project team reached this widely disbursed population segment through electronic and web-based communications as well as by placing meeting notices on existing public transit vehicles prior to the scoping process and each subsequent meeting.

6.1.2 Community Outreach and Public Involvement Program

A detailed Community Outreach and Public Involvement Plan was developed in order to ensure that the public was kept informed about the Regional Connector AA study on an ongoing basis and provided with opportunities to comment at key milestones throughout the study. The Plan included detailed stakeholder identification, communications protocols, public input tracking, and a proposed schedule for interfacing with the public and recommendations for how meetings should be conducted at various stages of the study. Additional recommendations for key stakeholder interviews or briefings, inter-agency coordination, and topical meetings were also included in the Plan. The Plan was

developed with the necessary flexibility to accommodate changing circumstances and enhanced approaches required for complex projects. Details of outreach efforts can be found in the Community Participation Summary and Report prepared in November 2008. Other documents such as public comment sheets, meeting handouts, presentation materials, public notices, and various meeting items can be found in the appendix sections of the Community Participation Summary and Report.

6.1.3 Stakeholder Identification and Database Development

A comprehensive stakeholder identification process was initiated to coincide with the early scoping process. A comprehensive study database was developed for the purposes of a targeted email and direct mail campaign to:

- Elected officials on the local, state and federal level
- Neighborhood Councils and other elected groups
- Homeowners Associations and Neighborhood Organizations
- Chambers of Commerce and business leaders
- Community-based and civic organizations
- Key employment centers and cultural/entertainment destinations
- Transportation advocates and interest groups
- Print, broadcast and electronic media, including community-based publications and blogs
- Local Business Improvement Districts (BIDs)
- Property management firms serving lofts and condominiums in the Downtown Los Angeles area

A copy of the stakeholder database is located in Appendix A.

Hand-in-hand with the development of the project database was preparation of a Community Profile which highlights the key opinion leaders for this project, as well as their possible issues, concerns and potential support/opposition to the alternatives.

6.2 Public Meetings

Three series of public meetings were held in November 2007, February 2008, and October 2008 as part of the ongoing community outreach and public involvement process.

6.2.1 Early Scoping Meetings

In addition to the Early Scoping Notice which was published in the Federal Register on October 31, 2007, a Public Meeting Notice was developed to notify communities about the Regional Connector study, the early scoping meetings, and opportunities for stakeholders to provide their input prior to the deadline for public comment.

Public Meeting Notices were distributed in a number of ways. A detailed list of 83 regional media outlets was developed which included mainstream, community-based and ethnic/foreign language print and broadcast outlets. A complete list of the media contacted for this project is included in Appendix H.

A press release (provided in Appendix C.5 of the Community Participation Summary and Report) was developed and distributed to all 83 outlets; for the community-based and ethnic print media, a specific request was made for inclusion of early scoping meeting information in their community calendars.

In addition, display advertisements for the early scoping meetings were placed in three (3) newspapers in the PSA and were selected based on their geographic focus, language needs and audited circulation numbers. Newspaper advertisements for the early scoping meetings were placed in the following newspapers:

Outlet	Run Date	Language	Circulation
Los Angeles Downtown News	October 26, 2007	English	49,000
Los Angeles Garment and Citizen	October 26, 2007	English, Spanish	25,000
Rafu Shimpo	October 23, 2007	Japanese	45,000

Approximately 400 individuals and organizations with email addresses were included in the initial stakeholder database. Email notices were sent out on October 23, 2007, with follow-up reminders sent on November 5, 2007. An electronic reminder to the community to submit comments was sent on November 21, 2007. Comments were accepted until November 30, 2007 – an extension of the original date of November 21st.

Over 500 notices were mailed to residents, agencies, and organizations in the PSA. Meeting notices were mailed on October 23, 2007. Notices were posted online at www.metro.net/regionalconnector.

Copies of the postal mailer document were delivered to property managers at 12 residential loft and condominium locations for posting in their public areas.

"Take-Ones" were placed on Metro buses and trains serving, and feeding into, the PSA on October 29, 2007.

All those on the stakeholder database either received two (2) email notices about the early scoping meetings (i.e., an initial notice followed by a reminder), or one (1) piece of direct mail. The offices of elected officials representing portions of the PSA were also contacted and alerted about the meetings.

Multiple organizations were contacted requesting that they forward invitations to the early scoping meetings to their members or constituents. These organizations included transportation advocacy groups, neighborhood and business organizations, civic groups, and academic institutions.

Metro staff also made follow-up calls to agencies inviting them to attend the Agency Early Scoping Meeting.

One (1) Agency Early Scoping Meeting and two (2) Public Early Scoping Meetings were held as described below.

6.2.2 Agency Early Scoping Meeting

Tuesday, October 30, 2007; 12:30 – 2:30 p.m.
Metro Headquarters, Board Overflow Room
One Gateway Plaza, Los Angeles, CA 90012

In attendance were 15 individuals, representing the following agencies:

- City of Los Angeles
- Department of City Planning
- Department of Transportation
- Department of Public Works: Bureau of Engineering
- Cultural Affairs Department
- Los Angeles County
- Metro
- Sheriff's Department: Transit Safety Bureau
- Los Angeles Community College District
- Los Angeles Regional Water Quality Control Board
- Southern California Regional Rail Authority
- State of California
- Public Utilities Commission

- United States Department of Homeland Security: Transit Security Agency

Comments were received during the review period from the City of Los Angeles Community Redevelopment Agency (CRA), the Metropolitan Water District (MWD) and the City of Los Angeles Department of Public Works Bureau of Engineering. A copy of the agency early scoping meeting materials is provided in Appendix N of the Community Participation Summary and Report, including the Early Public Scoping Packet, copy of the Power Point presentation and the exhibits.

6.2.3 Public Early Scoping Meetings

Two (2) Public Early Scoping Meetings were scheduled for November 2007. Public comment received at these Early Scoping Meetings formed the basis for development of a comprehensive range of alternatives for further study in the AA.

Meeting locations were selected to reflect equitable geographic coverage, proximity to public transportation and to minimize overlap with other meetings scheduled in the PSA. The public comment period was facilitated, and speakers were asked to limit their comment to two minutes.

The Public Early Scoping Meetings were scheduled as follows:

Early Scoping Meeting #1: Central Business District/Downtown Los Angeles,
Tuesday, November 6, 2007; 11:30 a.m. to 1:30 p.m.
Los Angeles Central Public Library, Meeting Room A
630 W. 5th St., Los Angeles, CA

68 people signed in at this meeting, and 17 individuals elected to speak. Metro received 15 written comments at the end of this meeting.

Early Scoping Meeting #2: Little Tokyo area/Downtown Los Angeles
Wednesday, November 7, 2007; 6 p.m. to 8 p.m.
Japanese American National Museum
369 E 1st St., Los Angeles, CA

49 people signed in at this meeting, and 16 individuals elected to speak. Metro received 13 written comments at the end of this meeting.

6.2.3.1 Overview of Comments Received

The public comment period for the Regional Connector commenced with the publication of the Early Scoping Notice in the Federal Register on October 31, 2007 and written comments were accepted until November 30, 2007.

A total of 132 individuals signed in at the Agency and Public Early Scoping Meetings. However, it is estimated that at least 160 people attended all three meetings. Formal public comments were collected from 88 people in the following five possible ways prior to the close of the comment period:

- 27 Verbal comments at Public Early Scoping Meetings
- 18 Written comments at Public Early Scoping Meetings
- 29 Written comments via email
- 14 Written comments via US mail
- 0 Verbal comments on the Information Phone Line

This section summarizes the 88 comments received from the public in verbal testimony at the early scoping meetings, written comments submitted at the early scoping meetings, via emails, and letters mailed to Metro.

The overwhelming majority of comments received supported the need for a Regional Connector to enhance the efficiency of the current and future rail system by providing through service between the Metro Blue Line, Gold Line, Gold Line Eastside Extension and Expo Line, and service to link these rail corridors directly to Union Station. Most commenter's supported almost equally a Grand Avenue and 1st St. alignment, below-grade (i.e. subway), and utilizing Light Rail Transit (LRT) technology. Several potential stations received wide popularity, including, in order of their level of support, Little Tokyo, 7th St./Metro Center, Bunker Hill, Union Station, Main/1st St. and Civic Center (i.e., in the northern portion of the PSA).

No comments were received opposing the Regional Connector, though a few remarks noted that other transit projects may need to receive a higher priority. Many commenter's specifically pointed out the need to develop a transit system that connects multiple lines, as well as expanding the 7th St./Metro Center Station to accommodate enhanced service and upgrading various operational systems. Of those providing feedback about the evaluation criteria, most thought that access was paramount.

The detailed comments were scanned and are provided in Appendix D.4 of the Community Participation Summary and Report. The following sections provide a summary of the general type of comments received and number of comments received associated with each type and issue by general subject matter and issues identified.

Comments Related to Mode

Whether the comments provided were written, emailed or submitted at the early scoping meetings, public comments showed tremendous support for LRT technology as the preferred mode for the Regional Connector. There was some support for looking at streetcars, but negligible interest in considering Bus Rapid Transit (BRT), Personal Rapid Transit (PRT) or monorail technology.

Comments Related to Grade

Almost all of the comments received by speakers at the early scoping meetings were in favor of a subway, or for a below-grade system. Of the 44 comments that spoke directly to grade preference, 36 stated a preference for a below-grade system. Of the 23 comments that spoke directly to a mode preference, 15 stated a preference for LRT. One comment received was mode neutral.

Comments Related to Alignment

Comments from these early scoping meetings indicated a nearly even split between supporters of a Grand Ave. alignment or a 1st St. alignment. Also receiving limited support was 2nd St., and an extension of the Blue Line. Limited preference was expressed for other routes including 3rd St. and Flower, with even less interest in the other potential alignments identified on the map that was displayed and distributed at the early scoping meetings.

There was also a small, but vocal, minority concerned with the lack of alignment options to provide connectivity with the southern portion of the PSA, and the lack of existing transit options serving Central City East and the Toy District. Some felt that the alignment should move considerably south, using Alameda St., and make a connection through these underserved areas directly to the 7th St./Metro Center Station.

Comments Related to Station Locations

Several potential stations showed wide popularity, and were somewhat reflective of those preferring the 1st St. route or a Grand Ave. option. The potential station location that received the most support was Little Tokyo, which was seen as the gateway of the Regional Connector into the PSA; followed by the 7th St./Metro Center Station, which is regarded as a key hub; Bunker Hill; Union Station; Main/1st St.; and Civic Center, serving the area in the northern portion of the PSA.

Key Issues Identified

Those stakeholders providing their comments about key issues felt strongly about the need for the Regional Connector to provide a link with Metro's transit line. Those providing input also noted that construction of this project would eventually require upgrades to power distribution, signals and controls systems, and would likely entail an expansion of and upgrades to the 7th St./Metro Center Station. Other issues raised included the need to add rail cars, improve station maintenance, examine increased safety for both stations and the lines, and consider implementing the technology used to construct the Gold Line tunnels.

Comments Related to Evaluation Criteria

There were only a few comments submitted that related to additional evaluation criteria that should be used. Three commenter's requested that evaluation criteria include pedestrian, stroller and ADA access. A smaller number of commenter's suggested that air quality and community impacts (with respect to downtown development) be heavily weighted.

Other General Comments

Of the general comments received, 28 expressed overall support for the project, and emphasized the need for connections to even more transit lines. Other responders emphasized that completion of the Regional Connector would ensure access to the Westside from all around the region. Others felt that the Regional Connector was not as important as other projects and should not be Metro's first priority. In addition, some felt that local funding for the Regional Connector should be sought, and that funding for the project should not come from raising fares.

6.3 Community Update Meeting Series #1

After the initial scoping meetings, a set of two community update meetings was held to present stakeholders with the results of the early scoping process.

In preparation for the meetings, focused outreach to the neighboring communities, key stakeholder groups, and local media was conducted. Beginning February 13, 2008, with the distribution of the media notice, a multimedia approach was conducted to alert the community to the upcoming meetings using direct mail and distribution of electronic notices.

In addition, to reach both residents and those working in the downtown area, advertisements were placed in Rafu Shimpo, Los Angeles Garment and Citizen, and the Los Angeles Downtown News. The advertisements were developed by Metro's graphic department.

Outlet	Run Date	Language	Circulation
Los Angeles Downtown News	February 18, 2008	English	49,000
Los Angeles Garment and Citizen	February 22, 2008	English, Spanish	25,000
Rafu Shimpo	February 21, 2008	English	45,000

Over 500 notices were mailed to residents, agencies, and organizations in the PSA via US mail or direct mail where no email contacts were available. Meeting notices were mailed on February 10, 2008. Notices were also posted online at www.metro.net/regionalconnector.

All those in the stakeholder database either received two (2) email notices about the early scoping meetings (i.e., an initial notice followed by a reminder), or one (1) piece of direct mail. The offices of elected officials representing portions of the PSA were also contacted and alerted about the meetings.

Multiple organizations were contacted requesting that they forward invitations to the early scoping meetings to their members or constituents. These organizations included transportation advocacy groups, neighborhood and business organizations, civic groups, and academic institutions.

Meeting notices were sent via email to those with email addresses in the study database. Approximately 383 individuals and organizations with email addresses were included in the initial stakeholder database. Email notices were sent out on February 14, 2008, with follow-up reminders sent again on February 18, 2008. An electronic reminder to the community to submit comments was sent on March 6, 2008.

Community meetings were held at the following locations:

Little Tokyo area/Downtown Los Angeles
Tuesday, February 26, 2008; 6 p.m. to 8 p.m.
Japanese American National Museum
369 E 1st St., Los Angeles, CA

Central Business District/Downtown Los Angeles
Thursday, February 28, 2008: Noon to 1:30 p.m.
Los Angeles Central Public Library, Meeting Room A
630 W. 5th St., Los Angeles, CA

6.3.1 Overview of Comments Received

Eleven alternatives were presented to the community at this series of meetings. All alternatives identified LRT as the preferred mode; however, of the alignments presented, most were below-grade, though one alternative included an aerial component. Of the alternatives considered, 7 utilized the 2nd St. tunnel.

Fifty-nine (59) people signed in at the Japanese American National Museum, with 14 people speaking at the meeting. Fifty-five (55) people signed in at the meeting held at the Central Los Angeles Public Library, with 12 people speaking at that meeting. In total, 57 comments were received, as follows:

- 26 Verbal comments at Public Community update meetings
- 6 Written comments at Public Community update meetings
- 25 Written comments via email
- 0 Written comments via US mail
- 0 Verbal comments on the Information Phone Line

This section summarizes the 57 comments received from the public in verbal testimony at the meetings, written comments submitted at the community update meetings, and via emails.

The majority of those who submitted comments supported a below-grade alignment. There was very little support for an at-grade alignment, particularly in the financial district. There were no concerns expressed about noise and vibration during tunneling through downtown Los Angeles. The community expressed interest in identifying ways to minimize transfers between the transit lines, and improved connections to the Metro Red Line.

Comments Related to Mode

All public comments received (written, emailed or submitted at the community update meetings) expressed continued support for LRT technology as the preferred mode for the Regional Connector.

Comments Related to Grade

Almost all the comments received by speakers at the community update meetings were in favor of subway, or for a below-grade system. Citing congestion concerns, the community preferred that the alignment be located below-grade.

Comments Related to Alignment

The community responded overwhelmingly in support of the project's concept, and specifically for alternatives 5, 6, and 8.

Alternative 5 begins at-grade at the Little Tokyo Gold Line station, and continues below grade through Civic Center, Little Tokyo, Grand Ave., and the financial district. Alternative 6, which appeared to have initial community support, places the entire alignment below-grade, and requires the reconstruction of the Little Tokyo Gold Line station. Alternative 8 would require the Little Tokyo Gold Line station to be relocated further west of the station's current location.

Comments Related to Station Locations

When asked about potential station locations, Grand Ave., Little Tokyo, and Bunker Hill were the most requested by those commenting. Several potential stations were widely popular, and were somewhat reflective of those preferring the 2nd St. option. The order of the level of support was: Little Tokyo, a station connecting Broadway to the LRT alignment at 2nd and Broadway, the 7th St./Metro Center Station, Bunker Hill, and one at the Civic Center, in the northern portion of the PSA.

Key Issues Identified

Those stakeholders providing their comments about key issues were emphatic about the need for the Regional Connector to provide a link with Metro's transit lines. In summary, the project is widely supported; LRT is the preferred mode; and an underground alignment is favored. Other issues raised included the potential need to add rail cars, improve station maintenance, and to consider implementing the technology used to construct the Metro Gold Line tunnels.

6.4 Community Update Meeting Series #2

A final round of community update meetings was held in October 2008 to present to the public Metro's recommendations for the Regional Connector AA study. In preparation for the meetings, focused outreach to the neighboring communities, key stakeholder groups, and local media was conducted. Beginning with the distribution of the media notice, a multimedia approach was implemented to notify stakeholders of the meetings. Ads in major newspapers, community papers, and notification through on-line blogs, direct mail and e-mails rounded out the outreach process.

In order to reach out to downtown residents and those working in the downtown area, advertisements were placed in Rafu Shimpo, Los Angeles Garment and Citizen, and the Los Angeles Downtown News. The advertisements were developed by Metro's graphic department.

Outlet	Run Date	Language	Circulation
Los Angeles Downtown News	October 13th & 20th	English	49,000
Los Angeles Garment and Citizen	October 10th & 17th	English, Spanish	25,000
Rafu Shimpo	October 11th	English	45,000

Meeting notifications were sent to the stakeholder database on September 26, 2008 via US mail or direct mail where no email contacts were available. All project information as well as information about the meetings was posted online at www.metro.net/regionalconnector. All elected officials at the local, state and federal levels within the PSA were also sent notification of the meetings.

Multiple organizations were contacted requesting that they forward invitations to the early scoping meetings to their members or constituents. These organizations included transportation advocacy groups, neighborhood and business organizations, civic groups, and academic institutions.

Approximately 109 people attended the final round of community meetings. The meetings were held as follows:

Thursday, October 16th; 12:00 p.m. to 1:30 p.m.
Los Angeles Central Public Library
630 W. 5th St., Los Angeles, CA

Tuesday, October 21st; 6:30 p.m. to 8 p.m.
Japanese American National Museum
369 E 1st St., Los Angeles, CA

6.4.1 Overview of Comments Received

51 comments were received from the final round of community meetings:

- 33 Verbal comments at Public Community update meetings
- 11 Written comments at Public Community update meetings
- 4 Written comments via email
- 3 Written comments via US mail
- 0 Verbal comments on the Information Phone Line

Comments Related to Mode

Stakeholders who attended the last round of meetings were overwhelmingly in support of building the Regional Connector as an underground LRT to the extent possible. Due to the heavy vehicular and pedestrian traffic in downtown Los Angeles, stakeholders believed that above ground rail will further congest this area. In addition, there are many festivals, films and other events happening in downtown Los Angeles and stakeholders did not want above ground rail to disturb these activities.

Comments Related to Alignment

There was considerable support in the community within the PSA to run the Regional Connector underground, with Alternative 1 as the preferred alignment. The underground alignment emerges at grade in the Little Tokyo area and there were several concerns raised about safety and congestion because of the heavy pedestrian traffic in this area.

Comments Related to Station Locations

Community members did not offer many comments related to station locations. Those commenting were supportive of Alternative 1, and the few comments related to station locations were centered on building the stations to accommodate the future growth of the Metro system. Another comment related to the mezzanine level station proposed at 2nd St., and suggested that this station be located underground. One other commentator mentioned that closing the 2nd St. tunnel to traffic would be very disruptive and suggested a below-grade option.

Key Issues Identified

The majority of comments from meeting attendees focused on the need for an underground system for this project, and warned of the congestion potential presented by the at-grade alternative. In addition, there were concerns about safety and congestion for the above ground section of Alternative 1 where it emerges in the Little Tokyo area. There were also structural concerns raised about the historic buildings in the PSA, especially during tunnel excavation. Most were opposed to perceived disruptions and noise from trains running at-grade.

6.5 Additional Meetings

In addition to the public community meetings held in October, Metro was asked by the Little Tokyo Community Council to attend its October 21st meeting to present the AA findings. Approximately 60 people attended this meeting. Metro's PowerPoint presentation was followed by members of the Council discussing their support for the

project as it moves forward. Concerns were raised by several speakers who wanted Metro to consider a construction mitigation program, and look for ways to protect the unique features of Little Tokyo as a neighborhood.

6.5.1 Additional Stakeholder Outreach Meetings

In addition to the public meetings, the project team proactively conducted a series of meetings with key stakeholders on an ongoing basis. The purpose of meeting with these groups was to create an informal forum to discuss specific concerns with individual stakeholder groups and to create an ongoing dialogue with these critical stakeholders as the project moved forward.

At the time the AA was initiated, Little Tokyo was the epicenter for the construction of the Metro Gold Line's Eastside Extension. The Historic Core, the City of Los Angeles, and Broadway theater owners had just started their investigation of integration of a streetcar into downtown Los Angeles. Additionally, the Metro planning team met with the Grand Avenue Project committee to discuss the evolution of that project. This convergence of projects and their associated champions provided Metro with established forums for stakeholder engagement.

6.5.1.1 Little Tokyo

Metro's team subsequently met with two groups from Little Tokyo on an ongoing basis: the Little Tokyo Community Council (LTCC) and the Little Tokyo Service Center (LTSC). The LTCC represents residents, business owners, land owners, civic leaders, City agencies, and educational institutions. As a Community Development Corporation, the Service Center provides social service and other programs to Little Tokyo residents, and assisted the project team in coordinating a meeting with business owners along 2nd St.

Metro's first presentation to the LTCC took place shortly after the first community update meeting on March 12, 2008. In response to concerns regarding the 11 alternatives presented to the community, the LTCC established a subcommittee to communicate directly with Metro as the AA moved forward. The initial concerns regarding the project centered around preserving the identity of the neighborhood, pedestrian impacts, and construction impacts.

Many on the committee felt the Temple St. alignment would best serve the Little Tokyo community. Alternative 2, using Figueroa, Flower, Dewap, to Temple Streets, would have required additional construction to the new LRT bridge at Temple and Alameda St. That alternative was determined to be financially infeasible. Additionally, potential station locations were identified as less desirable when compared to other project alternatives and potential station locations.

At this initial meeting, a "mitigated" Alternative 5 was presented to the group. This alternative would require a grade separation for auto traffic on Alameda St. Since the group responded positively to this change, additional details were presented at a second meeting.

The second meeting of the subcommittee was held on April 2, 2008. The subcommittee reviewed key concerns: pedestrian impacts, loss of neighborhood identity, and how construction might impact small businesses. In response to these concerns, Metro presented a "mitigated" project alternative, which would minimize construction impacts, and increase pedestrian access to the station and nearby neighborhood activities.

During this meeting, Alternatives 3b and 7 were presented to the group. Alternative 3b involves a couplet on both Los Angeles and Main Streets between 2nd and Temple Streets. Alternative 7 uses 2nd St. from Flower to Los Angeles St., turns at Los Angeles St. and at Temple St. While both alternatives were considered acceptable to the community, Alternative 5 remained as the preferred option.

Alternative 5 includes a grade separation along Alameda St., and the addition of a pedestrian bridge that serves to connect the Japanese American National Museum, the Mangrove project area, and provides an aerial crossing at 1st St. and the Office Depot property (located diagonally from the Little Tokyo/Arts District Gold Line Station.) The appeal of the intersection's treatment and the location of the potential portal satisfactorily addressed the subcommittee's primary concern regarding the construction and operational impacts of the Regional Connector.

A meeting with the Little Tokyo Service Center sought to address the concerns of business owners along 2nd St. This meeting took place on May 13, 2008 at the Japanese American Cultural Center. While there were many operational questions (e.g., how often would the trains cross into Little Tokyo, would the community feel the train passing) that would be addressed during the next phase of the project, the purpose of the meeting was to present the remaining Alternatives 3b, 5, and 7. Overall there was support for the project, and consensus that the business owners would like to be further engaged as the project moves forward. Community preference was for the alignment to be located below-grade, to minimize the construction impacts on access to area businesses.

6.5.1.2 Bringing Back Broadway

The Broadway Streetcar project is looking at ways to provide streetcar service along Broadway, connecting the Grand Avenue Project to LA Live. The project is a public/private venture with support from the City of Los Angeles (with the Community Redevelopment Agency and Council District 14 taking the lead on the project). Metro met with 5 separate organizations that play different roles in the Streetcar project:

- The Downtown Los Angeles Neighborhood Council
- Historic Core Business Improvement District
- Bringing Back Broadway Coalition
- Downtown Los Angeles Business Improvement District
- Central City East Association

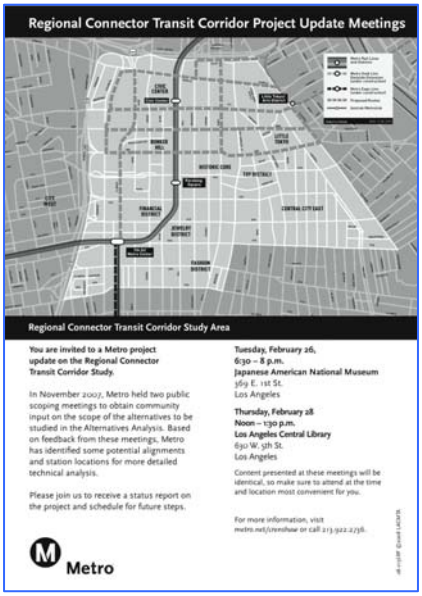
Initially, there was some uncertainty among stakeholders regarding differences between the Streetcar and Regional Connector projects. Metro clearly defined the differences in the project, namely the project goals, potential funding sources, services provided, and agency support. The intent of the Broadway Streetcar is to act as a "walk extender" and to support downtown pedestrian access, whereas the initial intent of the Regional Connector is to provide continuous service between the LRT options traveling through downtown Los Angeles.

With this concern resolved, the organizations began to consider how the Regional Connector could interact with the Broadway Streetcar. The Historic Core Business Improvement District and the Bringing Back Broadway Coalition agreed that a connection at 2nd and Broadway made the most sense.

The groups also recognized that a station need not be located directly at 2nd and Broadway if a portal located near 2nd and Broadway would provide the necessary access to the area as well. It was agreed that as long as transit users felt like they were accessing the station at 2nd and Broadway, it did not matter if they needed to walk a block below-grade to access the train.

The Historic Core Business Improvement District discussed the economic and transit oriented development opportunities located at 2nd and Broadway. They were hopeful that as the Regional Connector Transit Corridor Study continues, the Bringing Back Broadway Coalition will be active participants in the process, as the two projects are complementary. While the Broadway Streetcar issues did not appear to be as multifaceted as the concerns held in Little Tokyo, these two stakeholder groups played a significant role throughout the AA process.

All of the additional meetings are summarized in Table 6-1.



Regional Connector Transit Corridor Project Update Meetings

Regional Connector Transit Corridor Study Area

You are invited to a Metro project update on the Regional Connector Transit Corridor Study.

In November 2007, Metro held two public scoping meetings to obtain community input on the scope of the alternatives to be studied in the Alternatives Analysis. Based on feedback from these meetings, Metro has identified some potential alignments and station locations for more detailed technical analysis.

Please join us to receive a status report on the project and schedule for future steps.

Tuesday, February 26,
6:30 – 8 p.m.
Japanese American National Museum
369 E. 1st St.
Los Angeles

Thursday, February 28
Noon – 1:30 p.m.
Los Angeles Central Library
630 W. 5th St.
Los Angeles

Content presented at these meetings will be identical, so make sure to attend at the time and location most convenient for you.

For more information, visit metro.net/crenshaw or call 213.922.2736.

Metro

6.6 Collateral Materials

Various informational materials such as meetings notices, Fact Sheets and Newsletters were completed during the AA.

6.6.1 Meeting Notices

A postal mailer and an email notice were distributed prior to each series of community meetings. The postal mailer was distributed approximately 10 days prior to the first community meeting. The email notice was sent out twice (once as a "Save the Date" and later as a formal announcement) to the stakeholder list. The Regional Connector database is predominately email-based. A follow up email notice was sent to individuals included in the stakeholder database and those who attended the community meetings.

Table 6-1 Meeting Details			
Organization	Meeting Details	Key Issues	Follow-Up
Office of Councilwoman Jan Perry	July 31, 2007 Attendance: 6	Discussed status of Chief Legislative Analyst's Office RFP for development of property at 1st and Alameda Streets.	None required.
City of Los Angeles Downtown Street Standards	September 14, 2007 Attendance:15	Wanted additional details once the project has proceeded further (e.g., station lengths).	Scheduled a follow-up meeting after Early Scoping completed
Grand Avenue Committee	October 9, 2007 Attendance: 11	Wanted to schedule a working meeting with Committee's architect and engineer to consult as the construction of Grand Avenue proceeds.	Scheduled a meeting with Committee's architect and engineer
Elected Officials Briefing	October 17, 2007 Attendance:9	Interested in the participation of other elected officials both within and outside the PSA as this is a regional project. Concerned about potential impacts to the Little Tokyo community. Supportive of the economic benefit and environmental benefit potential.	Metro established a regular briefing schedule.
Central City Association, Transportation & Infrastructure Committee	October 25, 2007 Attendance: 15	Interested in galvanizing its membership in support of this study. Also undertook to circulate early scoping meeting information to its membership.	Returned to present this Committee with results of early scoping.
Downtown Neighborhood Council	November 13, 2007 Attendance: 45	Wanted to find ways to bring more transit opportunities to the downtown area. While no final recommendation was supported, the board president felt it was very important Union Station be considered as a part of the PSA.	Returned to present this Committee with results of early scoping.
Little Tokyo Service Center	November 20, 2007 Attendance: 64	Supported the project. Concerned that if the Little Tokyo/Arts District Gold line station becomes a terminus, the station would be at capacity. Encouraged by the idea that Little Tokyo would be easier to access, but wanted to protect pedestrian access.	Returned to present this Committee with results of early scoping.
Elected Officials Briefing	2/12/08	Supportive of the project and had a good understanding of the project's benefits. Favored the alterative that was going to be the most cost-effective.	Continued briefings at key milestones.
Little Tokyo Community Council	2/19/08	Standing community council meeting. Attended as a guest.	Participated with the Council's Regional Connector Subcommittee

Table 6-1 Meeting Details			
Organization	Meeting Details	Key Issues	Follow-Up
Little Tokyo Community Council	3/12/08	The group was concerned that an at-grade alignment would negatively impact the Little Tokyo community. Earlier in the day, the planning committee passed a resolution recommending the LTCC not support the Regional Connector if it runs along 2nd St., either above or below-grade. This group's preference was for the alignment to follow Temple. Alternative 5 with additional mitigations was then presented. The group reacted positively once the Alternative showing grade separation for auto traffic on Alameda was shown. However, they wanted more information on the operational impacts of the station. The group was willing to consider a presentation of the proposed resolution to support Alternative 5.	LTCC liaison coordinated next meeting with Metro Project Manager
Office of Councilman Huizar	3/14/08	Supported the project. Understood the regional significance of the project and recommended additional meetings outside of the downtown area.	Additional meetings to be conducted in the next phase of the project.
Rotary: LA Morning Club	3/20/08	The Metro team presented the current list of alternatives currently under review. The presentation was warmly received, with most of the questions focused on how to fund the project and what kind of system connections would be afforded.	Outreach consultant followed up to identify a date for a presentation to the LA 5 Rotary group. (Completed)
Downtown Los Angeles Neighborhood Council (DLANC): Transportation Committee	3/24/08	The presenters emphasized Metro's commitment to investment in Downtown Los Angeles, as well as balancing the need to provide regional service expansion. Those attending the meeting were most receptive to the below-grade alternatives. When asked about the potential for direct connections to Broadway and the Historic Core neighborhood, the Metro team concluded that technical, physical, and geographic limitations (regardless of grade) makes a direct connection infeasible.	Scheduled briefing for "Bringing Back Broadway" and HCBID for May 2008. Scheduled follow-up briefing with the DLANC Transportation Comittee for April 2008.
Little Tokyo Community Council	4/2/08	The group was concerned that an at-grade alignment through Little Tokyo would negatively impact the community. The community was especially concerned about how construction might impact the businesses along 2nd St., or affect plans for the "Go for Broke" monument planned on Temple. Metro's technical consultant requested specific details about the monument's location and construction timeline from the "Go for Broke" organization.	Continued to alert Community Council about upcoming community workshops LTCC liaison coordinated next meeting with Outreach Consultant (Completed)

Table 6-1 Meeting Details			
Organization	Meeting Details	Key Issues	Follow-Up
Historic Core BID	4/30/08	The Historic Core Business Improvement District (HCBID) requested to meet with Metro's project team for the Regional Connector Transit Corridor study to discuss potential impacts to Broadway, more specifically the HCBID's plans for implementing a streetcar on Broadway. Metro encouraged the HCBID to continue with its planning efforts for the Broadway Streetcar (BSC), and offered to work with the BSC planners to coordinate efforts to make the BSC a success. The HCBID asked whether the BSC should be included in the Regional Connector study, but Metro discouraged this approach.	Outreach Consultant secured meeting sign in sheet (Completed)
Downtown Center BID	5/07/08	Supported the project and saw it as an opportunity to promote business growth in the downtown area. Wanted to make sure there is a nexus between the proposed Broadway Streetcar and future station identification.	Continued to alert BID about upcoming community workshops
Bringing Back Broadway	5/07/08	The BBB organization was in the process of studying potential alignments for a local streetcar. The Broadway Streetcar study was then in its conceptual design phase, with the goal to complete the AA by July 2008. The organization hoped to secure a Negative Declaration designation of impact for the project.	Continued to alert group about upcoming community workshops
South Park Stakeholders Group	5/12/08	Group was supportive of the project and saw it as an opportunity to encourage more transit use in the neighborhood, encourage additional residential development, and assist the highly transit-dependent local area workforce. Wanted to find out if the project would include funding for improvements to the current Pico/Chick Hearn station.	Letter of support from the organization. (Letter has not yet been received, followed up with Group liaison via voicemail)
Little Tokyo Service Center	5/13/08	Meeting attendees were most interested in discussing potential construction impacts to 2nd St. Business owners along 2nd St. wanted more specific information regarding construction impacts to business owners, how long construction would impact the street, and traffic restrictions. One person asked if they would be able to feel the vibration of a below-grade LRT system under their building. Metro responded by letting the group know the topic would be covered in the EIS/R portion of the study.	Outreach Consultant added the contact information of those in attendance to the project stakeholder database (Completed)

Table 6-1 Meeting Details			
Organization	Meeting Details	Key Issues	Follow-Up
Little Tokyo Community Council	5/20/08	The Little Tokyo Community Council requested a brief project update during their regular board meeting. The Regional Connector presentation took approximately 20 minutes. The Council remained supportive of the project in concept, and looked forward to participating during the EIR/S process, should the board approve this step.	Continued to alert Community Council about upcoming community workshops
Central City East Association	5/28/08	The group was supportive of the project moving forward into the EIR/S phase. CCEA wanted more information during the EIR/S process about how the project would interface with the Broadway Streetcar, and whether construction of the project could be expedited.	Continued to alert BID about upcoming workshops
Downtown Living Weekend	6/6-8/08	Questions from the community surrounded Metro pass prices. Many of the people who asked about pass prices wanted to know which pass to use for access to both Metro and DASH services (EZ Transit Pass). Youth asked how to go about getting bus passes through the school district. Many people who visited the booth were seeking system maps.	No follow up needed
Westside Central Service Sector Governance Council	7/9/08	The Westside Central Service Sector Governance Council requested a brief project update during their regular meeting. The Regional Connector presentation took approximately 20 minutes. The Council was extremely supportive of the project in concept, and looked forward to future updates.	Report back in next phase
Higgins Building HOA	8/7/08	The group was supportive of the project; however, they were concerned about construction impacts. The group requested that the "box" of any station located at 2nd and Main be located closer to 2nd and Spring or Los Angeles, but station entrances could still be located next to the building.	Continued to alert the HOA about upcoming workshops.
Elected Officials Briefing	10/14/08	The briefing for elected officials was held at Metro. Questions asked pertained to when the project will go to the Board for approval to move into the environmental study. There were questions about station design and connections to the Gold Line and Eastside Extension.	No follow up necessary.

6.6.2 Fact Sheets

In order to provide the community with an updated project summary, fact sheets were developed and distributed at community update meetings and for community events (such as the Downtown Living Weekend). Four fact sheets were developed for public distribution, and posting on the project webpage.

6.6.3 FAQs

Used as both content for the project webpage and to provide a location for additional information, a "Frequently Asked Questions" was developed and updated as the project moved forward.

6.6.4 Project Website

A project website www.metro.net/regionalconnector was established to provide the public with electronic access to information about the project including collateral materials, the dates, times and locations of the community meetings, as well as an opportunity to provide public comment. In total, 56 emails were received via the project website. The website was updated at key project milestones and as needed.

6.6.5 Project Information Line

A dedicated phone line was also established to provide project information to the public. The telephone number for the information line is (213) 922-7277, and information is available on the line in English, Spanish, and Japanese. Information on the line includes times, dates, and locations of the public scoping and update meetings. Additionally, the callers were encouraged to leave public comment, questions about the project, and requests to be placed on the stakeholder mailing list in order to receive study information as it became available.

Regional Connector Transit Corridor Study

地域接続鉄道交通回廊の調査

ファクトシート（2）初期意見聴取集会における一般意見の要約

市民集会

地域接続鉄道交通回廊（Regional Connector Transit Corridor）の調査における一般の意見は、Federal Register に「初期意見聴取の通知（Early Scoping Notice）」を掲載することにより2007 年 10 月 31 日に始まりました。本調査の初期意見聴取プロセスの一環として、メトロでは地域集会を 2 回、以下のように開催しました。

2007 年 11 月 6 日（火）11:30 a.m.～1:30 p.m.
Los Angeles Central Public Library（ロサンゼルス中央市民図書館）

2007 年 11 月 7 日（水）6:00 ～ 8:00 p.m.
Japanese American National Museum（全米日系人博物館）

メトロでは、初期意見聴取集会でのほか、電子メール、郵便、情報電話ライン、本プロジェクトのウェブサイトより一般意見を集めました。初期意見聴取期間における正式な一般意見の受付期間は、2007 年 11 月 30 日に終了しました。

一般意見の要約

集まった意見の圧倒的多数は、メトロのブルー線、ゴールド線、ゴールド線のイーストサイド延長線およびエキスポ線間の直通サービスを提供し、これらの路線回廊を直接ユニオン駅に繋げることにより、現在および将来の鉄道システムの効率を上げる地域接続線の必要性を支持するものでした。意見提供者のほとんどは、Grand Avenue あるいは 1st Street に沿った地下鉄線で、ライト・レール・トランジット（LRT）技術を利用することを支持しました。駅の可能性として幅広い支持を得たものには、「リトル東京」、「7th Street/Metro」、「パンカーヒル」、「ユニオン駅」、「Main/1st」、「シビックセンター」などがありました。

地域接続線に反対する意見は皆無でした。多くの意見者が具体的に指摘したのは、複数の線を接続する交通システムを開発し、サービス強化のため 7th Street/Metro 駅を拡大、さらに様々な運用制度をグレードアップする必要性でした。本評価基準に関する意見を提供した方の中ではほとんどの意見が、最も重要なのはアクセス性である、というものでした。一般意見は全般的に以下のように集中しました。

The information line was activated in September 2007, and was updated in November 2007, February 2008 and September 2008. The information line was checked on a weekly basis when no community meetings were planned within 30 days. The information line was checked daily two weeks before and after community meetings. A tracking matrix was established to record incoming calls, and manage the follow-up process. There have only been three messages left on the information line to date. These calls were all reservations for a meeting with the Little Tokyo Service Center (held May 13, 2008).

6.6.6 Media Relations (Print & Broadcast)

A detailed list of 83 regional media outlets was developed which included mainstream, community-based and ethnic/foreign language print and broadcast outlets. A complete list of the media contacted for this project is included in Appendix H of the Community Participation Summary and Report.

Press releases were distributed by Metro to regional media outlets. The outreach consultant redistributed the press release to the list of media outlets as well as online media outlets, such as blogs, to help draw additional coverage.

To ensure that the AA process addressed the growing prevalence of "new" media in this region, outreach was also conducted to "blogs" which can best be described as an online continual open conversation. The Southern California region is host to thousands of blogs, and after some research, 34 key websites were located that discussed transit, traffic, community development, and neighborhood issues. All of the 34 blogs identified were sent a copy of Metro's press releases and the Public Notices.

Many of these blogs posted notices about the project, the AA process, the meetings, comments about the project, and summaries of the meetings after they occurred. In many cases, lively on-line "conversations" were initiated. Although it is difficult to ascertain how many "hits" each blog received about the project, the online conversations did contribute to a heightened awareness about the project and increased turnout at the community meetings. In addition, articles and comments posted on the blogs provided the study team with additional insight into public sentiment about the project.

6.6.7 New Media

New media is an ever-changing but widely used medium for communicating vital information quickly and effectively. Recognizing that the use of new media tools is relatively new to many government agencies, Metro committed itself to exploring and pursuing appropriate online media to proactively engage a full range of stakeholders. To this end, Metro established the Regional Connector Facebook page designed to reach out to a relatively untapped audience of college students and young adults. Facebook is a prime example of a communications need meeting a technological opportunity. Launched in September, the Regional Connector Facebook site has registered 64 unique users that are actively engaged in conversation about the project.

Facebook is a social network that connects people with friends and others who work, study and live around them. People use Facebook to keep up with friends, upload an unlimited number of photos, share links and videos, and learn more about the people they meet. Facebook has served as an online complement to the project website. Additionally, this new media element of outreach expanded current visibility encouraging any targeted demographic to access/join.

Assigned administrators updated the site with events, reports, videos and presentations. The Facebook group was monitored daily by the project team, and all comments left on discussion board and group's wall were captured in a tracking matrix as well as page PDFs. The content was refreshed frequently to ensure that these stakeholders were provided the most accurate information possible. Members of the Regional Connector Facebook page were also able to RSVP to Metro events such as the monthly board meeting, and converse with each other about the project.

Section 7 Comparative Analysis of Alternatives

7.1 Introduction

This section presents the comparative analysis of the two build alternatives, the No Build, and the Transportation System Management (TSM), carried from the initial screening process. As described in more detail in Section 2, after review and input received during the early scoping process on modes, alignments, station locations, and configurations, over thirty alternatives previously identified in a number of studies were evaluated. The number of alternatives was reduced during preliminary screening to 8, which were then evaluated using screening criteria established during the early scoping process. Based on this evaluation, the number of alternatives was further reduced to two build alternatives with one variation, a TSM, and a No Build Alternative. All other alternatives were eliminated from further consideration due to their inability to meet the project's goals and objectives.

The two build alternatives are as follows:

- At-Grade Emphasis Light Rail Transit (Alternatives 3A & 3B)
- Underground Emphasis Light Rail Transit (Alternative 5)

In addition, the TSM and the No Build alternatives were further analyzed and refined. The analysis and the recommendations are summarized in this section. This section is organized by the developed evaluation criteria, which expanded upon the FTA New Starts Evaluation and Ranking criteria.

7.2 Approach

Based on the Alternative Methodology Report provided to Metro, a final screening of the alternatives is the next step for evaluating alternatives. This final screening involves evaluating the remaining alternatives on a conceptual level and applying the goals and objectives for this project to each alternative. The following goals were identified for the Regional Connector Transit Corridor project:

Goal 1 - Support Community Planning Efforts: Support the progression of the PSA as an integrated destination and a dynamic and livable area, accommodating projected growth in a sustainable manner.

Goal 2 - Support Public Involvement and Community Preservation: Incorporate the public in the planning process and balance the benefits and impacts while preserving communities in the area, such as Little Tokyo/Arts District, Bunker Hill, Civic Center, and Historic District.

Goal 3 - Improve Mobility and Accessibility both Locally and Regionally: Develop an efficient and sustainable level of mobility within L.A. County to accommodate planned growth and a livable environment.

Goal 4 - Support Efforts to Improve Environmental Quality: Minimize adverse environmental impacts.

Goal 5 - Provide a Cost Effective Alternative Transportation System: Develop a system that serves as an economical alternative mode of transportation.

Goal 6 - Achieve a Financially Feasible Project: Develop a project that maximizes opportunities for funding and financing, and that is financially sustainable.

Goal 7 - Provide a Safe and Secure Alternative Transportation System: Develop a project that is safe for riders, pedestrians, and drivers, while meeting the region's needs for security.

The goals established for the Regional Connector are consistent with FTA New Starts Evaluation and Ranking Criteria as shown in Table 7-1.

Table 7-1 Project Justification Criteria and Measures
FTA New Starts Evaluation Criteria/Measures

Criterion	Measure(s)
Mobility Improvements	• Normalized Travel Time Savings (Transportation System User Benefits per Project Passenger Mile) • Number of Transit Dependent Riders Using the Proposed New Starts Project • Transit Dependent User Benefits per Passenger Mile on the Project • Share of User Benefits Received by Transit Dependents Compared to the Share of Transit Dependents in the Region
Environmental Benefits	• EPA Air Quality Designation
Cost Effectiveness	• Incremental Cost per Hour of Transportation System User Benefit • Incremental Cost per New Rider (for informational purposes only)
Transit Supportive Land Use and Future Patterns	• Existing Land Use • Transit Supportive Plans and Policies • Performance and Impacts of Policies
Other Factors	• Economic Development • Making the Case for the Project • Congestion Pricing • Optional considerations

As developed during the early scoping process, specific measures and criteria were established for each goal as a means of assessing whether an alternative meets the goal. A comparative analysis was performed to see how well each alternative performed in comparison to the others.

7.3 Goal 1: Support Community Planning Efforts

- Support land use policies and Community Plans
- Support and coordinate with development and redevelopment efforts
- Support the City's efforts to improve urban design and the pedestrian environment by contributing to a healthy environment
- Support efforts to improve safety and security for downtown residents, employees, and visitors
- Support transit dependent communities

7.3.1 Initial Screening Criteria

The initial screening criteria for Goal 1, its associated performance measures, and results of the findings for the two build, the No Build, and the TSM alternatives are presented in Table 7-2. Subsequent sections explain each performance measure and the results for each alternative.

Population, Population Density, Housing, Housing Density

For the two build alternatives, population and population density are higher for the underground versus the at-grade alternative, due to the fact that the underground alternative's alignment travels directly through the Little Tokyo community under 2nd St. Thus, within one-quarter mile of this alternative there are residential developments in Little Tokyo, as well as some converted warehouse lofts in the adjacent Arts District. The at-grade alternative heads north on Main and Los Angeles Streets and traverses the Civic Center area, which contains fewer households and residents, and more offices.

Transit Oriented Design supportive plans and policies in place

Transit Oriented Design (TOD) plans and policies include all state and local policies that support transit friendly development and design. Both the underground and at-grade alternatives are affected by five TOD supportive plans, including the LA City General Plan design/street standards, the Community Redevelopment Agency (CRA) 2006 Streetcar Study, part of the CRA Identified Redevelopment Areas, the CRA City Center Redevelopment Plan, and the Little Tokyo Planning and Design Guidelines. The underground alternative was rated a point higher for this measure because an underground system provides more development opportunities above station entrances and on properties used for construction. The at-grade alignments under consideration are street-running, and therefore do not provide the same off-street development opportunities.

Number of Jobs

For the two build alternatives, the at-grade alternative has higher employment and employment density when compared to the underground alternative. The at-grade alternative runs north-south on Main and Los Angeles Streets, adjacent to City Hall and various other city and federal buildings in the Civic Center. The densities of workers per square mile are greater in these buildings as opposed to the buildings in the vicinity of the underground alternative alignment.

Table 7-2 Support Community Planning Efforts Initial Screening Criteria

Goal	Performance Measure	At-Grade		Underground
		Option A	Option B	
1	Population, Population Density, Households, Housing Density for year 2030 (within 1/4 mile of alignment)			
1	Population (within 1/4 mile of alignment)	10,889	10,889	10,997
1	Population Density (within 1/4 mile of the alignment)	10,675 persons per sq mile	10,675 persons per sq mile	11,201 persons per sq mile
1	Households (within 1/4 mile of alignment)	8,523	8,523	8,744
1	Household Density (within 1/4 mile of alignment)	8,356 units per sq mile	8,356 units per sq mile	8,922 units per sq mile
1	Transit Oriented Design Supportive of Plans and Policies in place (Score 1-worst to 5-best)	4	4	5
1	Number of Jobs, Employment Density for year 2030 within 1/4 mile of alignment			
	Employment (within 1/4 mile of alignment)	133,888	133,888	124,110
	Employment Density (within 1/4 mile of alignment)	131263 jobs per sq mile	131263 jobs per sq mile	126,623 jobs per sq mile
1	Number of direct connections to key activity centers within 1/4 mile of alignment (Score 1-worst to 5-best)	5	5	5
1	Number of Opportunities for Redevelopment within 1/4 mile of alignment (underdeveloped or underutilized properties along alternative alignment)	8	8	9

Number of direct connections to key activity centers

The underground and the at-grade alternatives all received the best score of 5 for the number of direct connections to key activity centers within one-quarter mile of each alignment. Both alternatives traverse some of the busiest downtown corridors, with easy walking distances for key destinations, including the Civic Center, Little Tokyo, the Museum of Contemporary Art, the Grand Avenue Project, and the Bunker Hill/Library district. Further analysis of the final locations of stations and portals will assist in providing exact distances; however, the compact nature of the downtown blocks and the initial placement of the stations provide good coverage of key activity centers.

Number of opportunities for redevelopment

The number of opportunities for redevelopment within one-quarter mile of the alignments is calculated by estimating the number of underdeveloped or underutilized lots that may potentially be obtained for TOD, mixed use development, or transit friendly uses. There were a total of eight locations along the at-grade alternative that were identified as having redevelopment potential, while nine locations were identified for the underground alternative.

7.3.2 Final Screening Criteria

The final screening criteria developed for Goal 1 and its associated performance measures are presented in Table 7-3. The results of the findings for the two build, No Build, and TSM alternatives are presented in subsequent sections.

Table 7-3 Support Community Planning Efforts
Final Screening Criteria

Goal	Performance Measure	At-Grade		Underground
		Option A	Option B	
1	Number of planned development projects in the area over the next 10 years, including residential/office space/commercial units within 1/4 mile of alignment	20	20	22
1	Number of connections with sidewalks that support the City's Downtown Street Standards (Score 1-worst to 5-best)	5	5	5

Number of planned development projects in the area over the next 10 years, including residential/office space/commercial units

Downtown Los Angeles has experienced resurgence in high-rise residential and business development. The at-grade alternative corridor has approximately 20 planned or currently under construction projects within one-quarter mile of the alignment and the underground corridor has approximately 22 projects. These planned or currently under construction projects do not include the conversion of office space to residential lofts. Some of these new developments include the Yards, Mura, Block 8/Gateway, Vibiana Lofts, The Medallion, Zen, and Park Fifth.

Number of connections with sidewalks that support the City's Downtown Street Standards

The City of Los Angeles' Downtown Street Standards are a set of design guidelines which aid in the current and future planning and development efforts of sidewalks, streets, design enhancements, and any other features which would introduce a more cohesive street network in the downtown area. The design guidelines would not directly affect the underground alternative; however, design guidelines would affect station and portals locations. The at-grade alternative would be more directly affected by the design standards due to the need for redesigning street widths, right-of-ways, and sidewalks.

Both the at-grade and underground alternatives receive a high score for integration potential with the existing street design standards that are in place today. The station designs, as shown in the renderings in Section 2.3.3 and 2.3.4, remain consistent with the standards applicable to the specific street.

7.4 Goal 2: Support Public Involvement and Community

- Balance the benefits and impacts to low income and minority communities
- Enable workers and visitors to gain access to the regional center to increase its economic vitality and benefit from its economic opportunity

7.4.1 Initial Screening Criteria

The initial screening criteria for Goal 2, its associated performance measures, and results of the findings for the two build, the No Build, and the TSM alternatives are presented in Table 7-4. Subsequent sections explain each performance measure and the results for each alternative.

Table 7-4 Support Public Involvement and Community Initial Screening Criteria

Goal	Performance Measure	At-Grade		Underground
		Option A	Option B	
2	Evaluation of potential disproportionate effects: Environmental justice effects will be evaluated per NEPA/CEQA requirements (Score 1-worst to 5-best)	4	4	2
2	Initial areas identified for potential acquisitions for station and alignment	Approx.8 Locations	Approx. 8 Locations	Approx. 11 Locations
2	Evaluation of potential disproportionate effects: Number of low income households (HH) within 1/4 mile of proposed alignment (does not include actually in construction)			
	# of Low Income HH	3,702or 34.7%	3,702or 34.7%	3,390 or 35.3%
	# of SROs and shelters	19 (approx. 997 beds/rooms)	19 (approx. 997 beds/rooms)	20 (approx. 1,042 beds/rooms)
	# of Homeless Service Providers	9	9	9
2	Number of residents by ethnicity within 1/4 mile of alignment (US Census)			
	White	3,105	3,105	3,163
	African American	3,437	3,437	3,390
	American Indian/Eskimo	103	103	119
	Asian	8,978	8,978	4,699
	Hawaiian/ PI	23	23	23
	Other	60	60	54
	Two or more	334	334	322

Table 7-4 Support Public Involvement and Community Initial Screening Criteria				
Goal	Performance Measure	At-Grade		Underground
		Option A	Option B	
	Hispanic	5,861	5,861	7,769
2	Urban fit potential for alignment and for stations, including physical scale, visual fit, and cultural preservation	4	4	2
2	Percentage of service grade separated	34%	21%	91%
	Total underground - new tunnel & existing 2nd St. tunnel	46%	38%	94%
2	Community acceptance (high, medium, low)	High	High	High

Evaluation of potential disproportionate effects: Environmental justice effects will be evaluated per NEPA/CEQA requirements

Although both build alternatives would be evaluated under NEPA/CEQA requirements, scoring was used to determine which alternatives would potentially have more severe environmental justice impacts relative to others. The at-grade alternative received a score of four because it would not directly impact the Little Tokyo community (the only residential community in the PSA), as the alignment would not run directly through this community. The underground alternative received a lower score of two based on the alignment running directly under the Little Tokyo community, as well as the potential effects due to the 1st and Alameda St. intersection.

Area identified for potential acquisitions

Both build alternatives will require the acquisition of property. The at-grade alternative will require less property acquisition than the underground alternative but will still need property for traction power substations and other ancillary facilities, for incorporation of split stations into the public sidewalks, for portals, for the additional space required to allow for the train turns on the street surface and finally, for construction staging. The following is a list of potential areas impacted by acquisition with the At-Grade Emphasis LRT Alternative:

- Temple St. - south side between Alameda and Judge Aiso St.
- Main and Los Angeles Streets between Temple and 1st Streets to accommodate train turn movements and station platforms
- Corners of 2nd St. at Main and Los Angeles Streets to accommodate train turn movements
- 2nd St. between Hill and Los Angeles Streets to accommodate sidewalk widening, ancillary facilities such as traction power substations and construction staging

- Northeast corner of 3rd and Flower St. for train portal and construction staging
- Station entrances and emergency exits locations adjacent to 5th St.

The Underground Emphasis Alternative will require more property acquisition than the At-Grade Emphasis Alternative, as larger properties would be needed to place relief shafts, emergency exits, station entrances, train portals and construction staging. Although more area is required for the Underground Emphasis Alternative, there is a strong history of successful developments that Metro has undertaken with developers that produces revenue for Metro in terms of ground lease as well as new housing and commercial spaces for the community. Potential areas impacted by acquisition are as follows:

- Property bounded by Alameda, 1st, 2nd Streets and Temple Ave.
- 2 locations for station entrances for each station, total 6 sites
- Blast relief shafts (3) and emergency exits
- One traction power substation location

Evaluation of potential disproportionate effects: Number of low income HH

The evaluation of disproportionate effects considers the number of low income, single-occupancy units (SROs) and homeless shelters along each alignment. Of the total number of households within one-quarter mile of the at-grade alternative, 3,702 or 34.7% are low income households, compared to 3,390 or 35.3% of those within one-quarter mile of the underground alternative alignment. The number of SROs is 19 for the at-grade alternative and 20 for the underground alternative. The same number of homeless shelters are found within one-quarter mile of both alternatives.

Number of residents by ethnicity

The number of residents by ethnicity demonstrates the demographics of the downtown community. Both of the build alternatives are similar in that the population within one-quarter mile of the each alignment is composed of over 80 percent minorities. The ethnic majority population within one-quarter mile of the underground alternative is Hispanic, and the second highest ethnic population is Asian. The Asian population is the ethnic majority in the vicinity of the at-grade alternative, and the Hispanic population is the second highest population, followed by African American, then White.

Urban fit potential, including physical scale, visual fit, and cultural preservation by station and assignment

The urban fit potential was rated by station and by overall alignment. The results for the two build alternatives were rated as 'fitting' well into the existing urban environment while offering the maximum available direct connections to key activity centers within one-quarter mile of the alignment.

Percentage of service grade separated

The underground alternative contains a higher percentage of service grade separation, with 94 percent of the total alignment located underground. The at-grade alternatives differ slightly from each other due to differing lengths of underground alignments along the Flower St. portion of the line. Option A remains underground on Flower St. until just below 3rd St., while Option B surfaces on Flower St. just below 4th St. Thus, more Option A is located underground, including the new tunnel and existing 2nd St. tunnel, than Option B.

Community Acceptance

Both of the build alternatives received 'High' scores for the level of community acceptance, due to the high levels of positive response from community members, community organizations, and feedback received throughout the screening process. Initial comments expressed concern for impacts to the Little Tokyo community from the at-grade alternative. However, because the LRT alignment traverses the edges of the community, the direct impacts on Little Tokyo would be limited.

7.4.2 Final Screening Criteria

The final screening criteria developed for Goal 2 and its associated performance measures are presented in Table 7-5. The results of the findings for the two build, No Build, and TSM alternatives are presented in subsequent sections.

Table 7-5 Support Public Involvement and Community
Final Screening Criteria

Goal	Performance Measure	At-Grade		Underground
		Option A	Option B	
2	Number of potential acquisitions	12	12	11
2	Percentage of service grade separated	34%	21%	94%
2	Evaluation of potential disproportionate effects and risk to environmental justice populations related to construction activities (Score 1-worst to 5-best)	4	4	5
2	Urban fit potential, including pedestrian accessibility and urban design enhancement opportunities	4	4	4

Number of potential acquisitions

The At-grade Emphasis LRT Alternative includes approximately 12 locations where property acquisition may occur. Specific parcels and property owners will be identified in the next phase, the Draft EIR/EIS. The Underground Emphasis LRT Alternative includes approximately 11 properties where potential property acquisitions may occur.

Percentage of service grade separated

See previous section for a description of the percentage of service that would be grade separated under each build alternative.

Evaluation of potential disproportionate effects and risk to environmental justice populations related to construction activities

The at-grade alternative does not run through, but adjacent to, the only residential community in the PSA, Little Tokyo. Therefore, construction activities would only have limited effects on this community, with most of the activity located to the west and north of Little Tokyo. Construction activities for the underground alternative, which runs underneath Little Tokyo, would affect the community. Construction impacts at the 1st and Alameda Streets intersection and the 2nd and Los Angeles Streets intersection would be mitigated, as these are the areas in Little Tokyo where LRT portals and station entrances would be located.

Urban fit potential including pedestrian accessibility and urban design enhancement opportunities

Both the at-grade and underground alternatives maintain a high level of urban fit potential with the surrounding land uses, including pedestrian accessibility possibilities. The alternatives have the potential to be integrated into the existing environment and dense streetscape. There also exists various possibilities to introduce creative new transit and pedestrian friendly street features, such as bicycle centers, 'green-scapes', and other enhancements.

7.5 Goal 3: Improve Mobility and Accessibility both Locally and Regionally

- Improve the connectivity of the regional transit service and provide a more attractive travel alternative for residents, workers, and visitors in the region
- Facilitate sustainable regional development
- Increase ridership of the Metro transit system and reduce single occupancy trips
- Maintain or enhance transit services to the transit dependent
- Improve travel time for transit users system-wide
- Improve person throughput
- Reduce growth of congestion in corridor

7.5.1 Initial Screening Criteria

The initial screening criteria for Goal 3, its associated performance measures, and results of the findings for the two build, the No Build, and the TSM alternatives are presented in Table 7-6. Subsequent sections explain each performance measure and the results of each alternative.

Increase in daily transit boarding's

Of the two build alternatives, the underground alternative demonstrates a significant increase in the number of daily transit users, with 19,800 users compared to the at-grade increase of 10,100 users. Some station locations for the At-Grade Emphasis LRT Alternative are not in prime locations where there is an abundance of dense residential, commercial, and office uses.

New daily transit trips compared to No Build and TSM Alternatives

The TSM alternative would result in the smallest increase in daily transit trips (about 1000). This is likely because it does not reduce transfers for any rail passengers, but does provide a convenient new shuttle service through downtown Los Angeles. The Underground Emphasis LRT Alternative would likely attract the most new users to the system because it has the shortest trip time and it directly serves several major destinations in the PSA. The At-Grade Emphasis LRT Alternative would bring between 7,600 and 8,400 new users to the transit system.

Traffic impacts

With the Underground Emphasis LRT Alternative, all of the intersections in the PSA will either remain at the same level of service as under the No Build Alternative or improve. Traffic congestion at 1st and Alameda Streets would lessen by about 20%. Traffic congestion will be largely the same under the TSM Alternative as under the No Build Alternative. However, traffic congestion will worsen at many intersections under the At-Grade Emphasis LRT Alternative, including 1st and Broadway, 1st and Spring, 1st and Los Angeles, 1st and Judge John Aiso, 2nd and Main, 2nd and Los Angeles, 2nd and Spring, 2nd and Main, Los Angeles and 3rd, San Pedro and 3rd, Temple and Main, Los Angeles and Temple, Judge John Aiso and Temple, and Temple and Alameda.

Reduction in number of transfers

Both of the build alternatives would reduce transfers for many Metro Blue, Gold, and Expo Line passengers. The At-Grade Emphasis LRT Alternative would eliminate 16,600 transfers from both existing and new transit trips system-wide. The Underground Emphasis LRT Alternative would attract more new riders to the system due to its faster speeds and favorable station locations. As such, it would eliminate 20,700 transfers daily.

Table 7-6 Improve Mobility and Accessibility Both Locally and Regionally Initial Screening Criteria						
Goal	Performance Measure	No Build	TSM	At-Grade		Underground
				Option A	Option B	
3	Increase in daily transit boarding's (amount of transit users increased compared to No Build)			10,100	10,100	19,800
3	New daily transit trips (compared to No Build)		1000	7,600	8,400	10,200
3	New daily transit trips (compared to TSM)			6,700	7,400	9,200
3	Traffic Impacts (number of intersections with E or F Level of Service)			3	3	1
3	Reduction in number of transfers by operational plan of alignment (daily reductions at Union Station & 7th St./Metro Center Station)			16,600	16,600	20,700
3	Total number of lanes reduced (cumulative for all streets)			24	27	0
3	Number of potentially impacted intersections			12	13	1
3	Peak period travel time through Regional Connector Alignment (including 5 min. for each transfer)					
	North-South: Union Station to Pico Station	17 min	22 min	14 min	14 min	12 min
	East-West: 1st St./Utah St. (to Union Station) to Pico Station	23 min	30 min	15 min	14 min	10 min
3	Number of left turn pockets affected			8	10	4
3	Number of on-street public parking spaces affected			88	88	0
3	Number of driveways affected			26	30	2
3	Daily hours of transportation user benefits (compared to No Build)		700	8,900	9,900	12,100

Total number of lanes reduced

The number of lanes reduced is the cumulative number of roadway segments (blocks) where there will potentially be a reduction in the lane width due to an LRT alignment. The At-Grade Emphasis LRT Alternative will have a greater number of possible lane width reductions, with Option A affecting 24 lanes and Option B affecting 27 lanes. Traffic impacts are also considered higher due to the resulting reduction in the existing roadway capacity.

The Underground Emphasis LRT Alternative would not cause a reduction in any street lane widths along the alignment. Although the underground alternative introduces an underpass along Alameda St., the existing lanes would drop below ground while street

level movements would retain the current number of lanes. The At-Grade Emphasis LRT Alternative has a similar underpass proposed at Temple and Alameda Streets, so there would be little difference between the two alternatives in terms of impacts on Alameda St. traffic.

Number of potentially impacted intersections

The number of potentially impacted intersections is the number of intersections that the LRT alignment will pass through that may experience disruption or alteration due to current configuration or physical features. The At-grade Emphasis LRT Alternative options differ at the 4th and Flower St. intersection; Option A may impact a total of 12 intersections, while Option B may potentially impact 13 intersections. The Underground Emphasis LRT Alternative has only one intersection that may be impacted, at 1st St. and Alameda St. These estimates include only permanent impacts, not temporary construction impacts.

Peak period travel time between major origins and destinations

In addition to reducing transfers, one of the objectives of the Regional Connector is to provide faster travel to downtown destinations and to destinations outside of downtown. For north to south movement, the Metro Gold Line and Blue Line would be connected, resulting in reduced travel time between Union Station and Pico Station. Currently, the travel time between these destinations is approx. 17 minutes. The underground alternative lessens this travel by nearly six minutes to 12 minutes total. For the at-grade alternative, the trip from Union Station to Pico Station would take about 14 minutes.

For east to west movements, the Eastside Gold Line and Exposition Line would be connected, reducing travel time between 1st St./Utah St. and Pico Station. When the Eastside Gold Line begins operation in 2009, the travel time between these two destinations will be about 23 minutes. The underground alternative would see a peak period reduction of this trip to 12 minutes. For the at-grade alternative, the trip would take 14-15 minutes.

Number of left turn pockets affected

This performance measure considers the number of left turn pocket lanes that will be removed or displaced by the LRT alignment. The at-grade Option A would displace a total of 8 left-turn pocket lanes, while Option B would displace a total of 10 left-turn pocket lanes. In comparison, the underground alternative would displace a total of 4 left-turn pockets.

Number of parking spaces potentially affected

The total numbers of potentially affected parking spaces are those that exist along the alignment that could potentially be removed and would need to be replaced. Both options for the at-grade alternative could affect 88 parking spaces located along 2nd, Main, Los Angeles, and Temple Streets. Comparatively, the underground alternative has minimal impacts on existing parking spaces due to being predominantly below-grade.

Number of driveways affected

The driveways that would potentially be impacted are those located directly along the alignment corridor. The at-grade alternative Option A would impact a total of 26 driveways along the alignment compared to a total of 30 driveways with Option B. The additional driveways for Option B are located along the Flower St. segment between 5th St. and 3rd St. and are those associated with the World Trade Center, the Westin Bonaventure, and other financial district buildings. The underground alternative does not affect any driveways along the alignment corridor.

7.5.2 Final Screening Criteria

The final screening criteria developed for Goal 3 and its associated performance measures are presented in Table 7-7. The results of the findings for the two build, No Build, and TSM alternatives are presented in subsequent sections.

Table 7-7 Improve Mobility and Accessibility Both Locally and Regionally
Final Screening Criteria

Goal	Performance Measure	No Build	TSM	At-Grade		Underground
				Option A	Option B	
3	Daily hours of transportation user benefits (compared to No Build)		700	8,900	9,900	12,100
3	Congestion relief (Number of intersections with improved LOS/worsened LOS in both AM and PM peak periods)		Same as No Build	1 improved (AM) 11 worsened (AM) 1 improved (PM) 16 worsened (PM)	1 improved (AM) 11 worsened (AM) 1 improved (PM) 16 worsened (PM)	1 improved (AM) 0 worsened (AM) 1 improved (PM) 0 worsened (PM)
3	Comparison of peak period travel times between major travel pairs (assuming 5 minutes per transfer)					
	Sierra Madre Villa to Long Beach Transit Mall	97 mins	102 mins	94 mins	94 mins	92 mins
	Sierra Madre Villa to Pomona/Atlantic	49 mins	49 mins	58 mins	58 mins	58 mins
	Sierra Madre Villa to Washington/National	70 mins	75 mins	72 mins	71 mins	70 mins
	Pomona/Atlantic to Washington/National	61 mins	66 mins	52 mins	51 mins	48 mins
	Pomona/Atlantic to Long Beach Transit Mall	88 mins	93 mins	84 mins	84 mins	80 mins
3	Peak period travel times (Union Station to Staples Center - Pico Station)	17 mins	22 mins	14 mins	14 mins	12 mins
3	Travel times savings (over No Build)			3 mins	3 mins	5 mins
3	Reduction in VMT			N/A	N/A	N/A
3	Assessment of expandability (Score 1-worst to 5-best)			4	4	2

Hours of transportation user benefits

The Underground Emphasis LRT Alternative would yield about 12,000 daily hours of user benefit, the most of any alternative under consideration. This is partly due to the fact that it would have the fastest travel speeds and is projected to attract the most riders. The At-Grade Emphasis LRT Alternative would generate 8,900 daily hours of user benefit under Option A and 9,900 under Option B. The TSM Alternative would yield the fewest hours of benefit, 665, beyond the No Build scenario, as it would not eliminate any transfers for rail passengers or significantly speed their trips.

Congestion relief

The TSM Alternative would not have any effect on LOS at intersections within the PSA. The Underground Alternative would improve the intersection of 1st St. and Alameda St during both the morning and afternoon peak periods, but would leave LOS at the rest of the PSA's intersections largely unchanged. The At-Grade Emphasis LRT Alternative would yield LOS improvements at the intersection of 2nd St. and Broadway in the morning and at 2nd St. and San Pedro St. in the evening, but would worsen the performance of 14 to 16 other intersections in the PSA. This is likely because the At-Grade Emphasis LRT Alternative would require the conversion of existing traffic lanes to street-running rail right-of-way.

Comparison of peak period travel times between major travel pairs

For the most part, each of the build alternatives would yield a travel time savings of three to eight minutes during peak hours on trips involving the Metro Blue, Gold, or Expo Lines. For some trips, including those involving the Metro Expo Line and the Pasadena Gold Line, trip times would increase by one or two minutes under the build alternatives, but passengers would have one less transfer and would accordingly experience less uncertainty regarding their travel times. All build alternatives would add a new transfer to trips between the Pasadena and East Los Angeles branches of the Metro Gold Line, thus lengthening the trip time by about 9 minutes. The TSM alternative would increase trip times slightly because the shuttle buses would not run as quickly as the existing Metro Red and Purple Line subway.

Peak period travel times

The peak period travel times from Union Station to Pico Station would be 17 minutes under the No Build Alternative. The TSM Alternative would lengthen this time to 22 minutes due to the use of shuttle buses in mixed-flow traffic lanes. The At-Grade Emphasis LRT Alternative would shorten the trip to approximately 14 minutes, and the faster Underground Emphasis LRT Alternative would yield a travel time of 12 minutes. It should be noted that peak hour headways on the Metro Blue, Red, Purple, and Gold Lines are all different, and the actual transfer times between these lines vary from trip to trip. One advantage of the Regional Connector would be the elimination of transfers and the associated trip time uncertainty.

Travel times savings

During peak hours, when headways are short on all Metro Rail lines, the travel time savings over the No Build Alternative would range from three minutes on the At-Grade Emphasis LRT Alternative to five minutes on the Underground Emphasis LRT Alternative. During off-peak and late night hours, when headways are typically 20 minutes, the travel time savings will increase to 15 minutes or more.

Reduction in VMT

Due to the small length of the Regional Connector project, the reduction in VMT are minor compared to the overall system and may not be statistically meaningful in distinguishing one project from the other. However, both build alternatives are considered to provide some level of VMT reductions for the PSA.

Assessment of expandability

Due to the built out nature of the PSA, the existing light rail system and the proposed build alternatives would require significant infrastructure to expand in the future. Metro has identified at least two extensions in its 2007 Draft Long Range Transportation Plan, including an extension to the northwest and an extension south eventually connecting with Metro's Harbor subdivision. While the At-grade Emphasis LRT Alternative provides greater accessibility, at some point either extension will require aerial or underground configurations due to topography, the built environment and traffic considerations. The Underground Emphasis LRT Alternative initiates below-grade, so the cost of extension is already high; however, extension may be feasible depending on growth projections in jobs, population and ridership. The Underground Emphasis LRT Alternative does not currently include provisional design features to facilitate such a future extension.

7.6 Goal 4: Support Efforts to Improve Environmental Quality

- Minimize adverse environmental impacts
- Implement mitigation measures to reduce environmental effects to acceptable levels
- Reduce emissions and improve air quality

7.6.1 Initial Screening Criteria

The initial screening criteria for Goal 4, its associated performance measures, and results of the findings for the two build, the No Build, and the TSM alternatives are presented in Table 7-8. Subsequent sections explain each performance measure and the results of each alternative.

Table 7-8 Support Efforts to Improve Environmental Quality Initial Screening Criteria				
Goal	Performance Measure	At-Grade		Underground
		Option A	Option B	
4	Noise (number of curves for LRT alignment)	6	6	3
4	Potential visual impacts to notable architectural resources within 1/4 mile of alignment (Score 1-worst to 5-best)	1	2	4
4	Number of Potential Sensitive Receptors within 1/4 mile of alignment (Score 1-worst to 5-best)	5	5	5
4	Potential impacts to historically significant locations within 1/4 mile of alignment	217	217	203
4	Geologic and geotechnical issues along alignment (Score 1-worst to 5-best)	2	2	1

Noise

To evaluate noise, the number of required curves in the track is used, as curves have higher potential to generate noise. Curves include on-street turns as well as turns from surface to underground configurations. The At-Grade Emphasis LRT Alternative would require six curves, while the underground alternative surfaces at one location and also contains three directional movements that may impact noise levels. Therefore, the at-grade alternative has a higher potential than the underground alternative for direct noise impacts.

Potential visual impacts to notable architectural resources

Through the initial screening process, current landmarks and notable architecturally significant buildings were identified as potentially sensitive to visual impacts. The underground alternative scores higher than the at-grade alternative in this regard because there is less potential for visual impacts along an underground alignment. The at-grade alternative Option A scores lower than Option B because, although identical in alignment, the differences in configuration cause differences in visual impacts.

Number of potential sensitive receptors along alignment

Sensitive receptors are initially described as individuals with respiratory diseases, children, and the elderly who occupy sensitive land uses such as daycare facilities, libraries, parks, churches. Due to the minimal amount of these sensitive land uses within the PSA, both build alternatives receive a high score for having low potential impacts on sensitive receptors.

Potential impacts to historically significant locations along alignment

Of the two build alternatives, the underground alternative has a higher (less impactful) score in terms of potential impacts to historically significant locations within one-quarter mile of the alignment, which include two National Historic Landmarks, four National

Register Districts, 78 individual National Register properties/resources, 88 California Register destinations, and 31 local landmarks. In comparison, the at-grade alternative has the potential to impact a handful more locations, including two National Historic Landmarks, five National Register Districts, 75 Individual National register properties/resources, 98 California Register designations, and 37 local landmarks.

Geologic and geotechnical issues along the alignment

Geologic and geotechnical issues are generally related to the amount of new underground configuration the alternative includes. Therefore, the underground alternative has the higher potential for these issues since the alignment is over 90% underground. The at-grade alternative also has the potential for geologic and geotechnical issues along the Flower St. tunnel. This portion of the alignment connects with the existing 7th St./Metro Center Station, in a new tunnel segment.

7.6.2 Final Screening Criteria

The final screening criteria developed for Goal 4 and its associated performance measures are presented in Table 7-9. The results of the findings for the two build, No Build, and TSM alternatives are presented in subsequent sections.

Table 7-9 Support Efforts to Improve Environmental Quality
Final Screening Criteria

Goal	Performance Measure	At-Grade		Underground
		Option A	Option B	
4	Expected level of impacts after mitigation to biological, social, and physical resources will be evaluated per CEQA/NEPA requirements (Score 1-worst to 5-best)	3	3	4
4	Reductions in PM10, NOx, and SOx emissions (Score 1-worst to 5-best)	N/A	N/A	N/A
4	Reduction in carbon footprint for average user (Score 1-worst to 5-best)	N/A	N/A	N/A

Expected level of impacts after mitigation to biological, social, and physical resources will be evaluated per NEPA/CEQA requirements

During the initial study, it was determined that there was no evidence that the proposed alignments would cause significant environmental effects on the following impact areas: biological, land use and planning, and population and housing. Because of existing downtown Los Angeles characteristics, both the at-grade and underground alternatives can be integrated into the existing urban environment. The at-grade alternative receives a point less since it has higher potential for impacts to these resources, being located at-grade versus underground.

During next phases of analysis (EIR/EIS), mitigation measures will be proposed to reduce any significant impacts on issues such as air quality, biological resources, cultural resources, geology and soils, hazards and hazardous materials, hydrology and water quality, mineral resources, noise, public services, recreation, transportation and traffic, and utilities and service systems, among others.

Reductions in PM10, NOx and SOx emissions

There is no difference in reductions in PM10, NOx, and SOx emissions under the at-grade or underground alternative.

Reduction in carbon footprint for average user

There is no difference in carbon footprint reduction for the average user under the at-grade or underground alternative.

7.7 Goal 5: Provide a Cost Effective Alternative Transportation System

- Increase ridership on the Metro system
- Minimize cost per passenger
- Maximize travel time savings

7.7.1 Initial Screening Criteria

The initial screening criteria for Goal 5, its associated performance measures, and results of the findings for the two build, the No Build, and the TSM alternatives are presented in Table 7-10. Subsequent sections explain each performance measure and the results of each alternative.

Table 7-10 Provide a Cost Effective Alternative Transportation System Initial Screening Criteria

Goal	Performance Measure	TSM	At-Grade		Underground
			Option A	Option B	
5	Rough order of magnitude annual O&M (2008 $) costs per alignment (millions)	$13.60 M	$9.80 M	$9.55 M	$5.15 M
5	User Cost - Cost Effectiveness compared to No Build ($/hour of transit user benefit)	$97.28	$24.75	$20.36	$18.63

Rough order of magnitude (ROM) O&M costs

Operating and maintenance (O&M) costs are correlated with the number of peak LRT vehicles needed for daily operations. Estimating the number of total and peak LRT vehicles for each alternative requires the development of an operating plan for each

alternative, including running times and 'recovery' times, the number of cars per train, and the number of vehicles needed for spares and other services. Based on the operating plans for each alternative, the at-grade alternative will require 319 LRT vehicles and the underground alternative will require 303 LRT vehicles (due to the better travel time underground).

The ROM annual operating and maintenance cost for the at-grade alternative would be $10 Million, while the underground alternative O&M cost would be $5 Million.

User Cost – Cost Effectiveness

The cost effectiveness index measures the annualized change in capital cost and the annual O&M cost divided by the annual hours of transit-users benefits. FTA currently uses approximately $24 to $25 per hour of transit user benefit. The underground alternative rates the highest in cost effectiveness at $19. The at-grade alternative Option A performs the worst at $25, with Option B following at $20.

7.7.2 Final Screening Criteria

The final screening criteria developed for Goal 5 and its associated performance measures are presented in Table 7-11. The results of the findings for the two build, No Build, and TSM alternatives are presented in subsequent sections.

Table 7-11 Provide a Cost Effective Alternative Transportation System
Final Screening Criteria

Goal	Performance Measure	TSM	At-Grade		Underground
			Option A	Option B	
5	Annualized cost per hour of user benefit beyond the No Build Alternative	$97.28	$24.75	$20.36	$18.63
5	Year 2030 Annual O&M costs (in millions)	$13.60	$9.80	$9.55	$5.15

Annualized cost per hour of transit system user benefit compared to No Build and TSM Alternatives

The TSM Alternative would have the highest cost per hour of transit system user benefit of all of the alternatives. Even though it has the smallest capital cost, the TSM Alternative does not eliminate any transfers for rail passengers, and would impart a much lower level of benefit than the build alternatives. The At-Grade Emphasis LRT Alternative would have a cost per hour of user benefit of $20.36 to $24.75. The Underground Emphasis LRT Alternative would have the lowest cost per hour of user benefit ($18.63), largely because it serves the same area as the At-Grade Emphasis LRT Alternative but has a shorter travel time and station locations are more conducive to high ridership.

Annual O&M costs

Though it has the highest capital costs, the Underground Emphasis LRT Alternative would be the least expensive to operate. At $5.15 million per year, operational costs would be just over half of the annual O&M costs of the At-Grade Emphasis LRT Alternative ($9.55-$9.8 million). This is because the speeds on the underground alignment would be faster, and fewer trains would be needed to operate the service. The TSM alternative would be the most expensive to operate, at $13.6 million per year, likely due to the high volume of buses that would be needed to yield frequent headways.

7.8 Goal 6: Achieve a Financially Feasible Project

- Opportunities for private/public funding
- Opportunities for Federal and outside funding

7.8.1 Initial Screening Criteria

The initial screening criteria for Goal 6, its associated performance measures, and results of the findings for the two build, the No Build, and the TSM alternatives are presented in Table 7-12. Subsequent sections explain each performance measure and the results of each alternative.

Table 7-12 Achieve a Financially Feasible Project
Initial Screening Criteria

Goal	Performance Measure	TSM	At-Grade		Underground
			Option A	Option B	
6	ROM Capital Costs - total and per mile per alignment (millions) (2008$)				
	total	$62.74	$795.67	$709.30	$910.36
	per mile per alignment		$424	$339	$414
6	Evaluation of availability and eligibility of capital funds at federal/state local levels to construct, operate and maintain (Score 1-worst to 5-best)				
	Federal (CEI)		1	2	5
	State (cost)		1	2	2
	Local (Cost & Subway restrictions)		1	2	1

ROM Capital Costs – total and per mile

The categories estimated for each alternative include fixed-guideway construction costs, station costs, LRT vehicles, parking (if required), maintenance and operating facility allowance, and a 10 percent unallocated contingency. The lowest cost alternative is the at-grade Option B at $709.60 million, followed by Option A at $795.67. The underground alternative capital cost would be $910.36 million.

Another measure of interest is the capital cost per mile. Again, the at-grade Option B has the lowest capital cost per mile at $339 million, followed by the underground alternative at $414 million per mile. The at-grade Option A would have the highest capital cost per mile at $424 million.

Evaluation of availability and eligibility of capital funds at federal/state/local levels to construct, operate and maintain

Three measures for funding sources were evaluated: federal, state, and local. The FTA New Starts Program is the primary funding source for federal funds. For this evaluation, the cost-effectiveness threshold is used as the measure for federal funding potential. The higher the cost-effectiveness compared to the threshold, the better the alternative. FTA currently uses a cost-effectiveness threshold of approximately $24 to $25 per hour of transit user benefit. The underground alternative currently rates the highest (best) in cost-effectiveness at $19, followed by the at-grade Option B at $20, then at-grade Option A at $25.

For state funding, the alternative with the lowest capital cost has the higher potential for state funding assistance. Because of the competitiveness of this project with other high priority transit projects, both the underground and the at-grade Option B receive the same score of two, while the at-grade Option A (with the highest capital cost) receives the lowest score of 1.

7.8.2 Final Screening Criteria

A comparative discussion of the build alternatives based on the final screening criteria and associated performance measures developed for Goal 6 is provided below. Table 7-13 contains a comparison of each build alternative's costs broken down into FTA's Standard Cost Categories. The results of the findings for the No Build, TSM, and two build alternatives are discussed in subsequent sections.

Table 7-13 Achieve a Financially Feasible Project
Final Screening Criteria

Goal	Performance Measure	At-Grade		Underground
		Option A	Option B	
6	Capital cost per rail route mile estimate disaggregated by right of way (ROW), guideway, stations, yards, and vehicles (in millions of dollars)			
	Guideway and Track Elements	$120.4	$114.3	$146.2
	Stations, Stops, and Terminals	$46.3	$25.0	$73.6
	Support Facilities: Yards, Shops, Maintenance Buildings	$8.7	$8.7	$3.3
	Site work and Special Conditions	$86.5	$80.9	$117.0
	Systems	$18.2	$18.2	$19.6
	ROW, Land, Existing Improvements	$2.1	$2.1	$34.3
	Vehicles	$29.4	$29.4	$11.1
	Professional Services	$92.5	$81.6	$118.7
	Unallocated Contingency	$40.3	$36.0	$52.4
	TOTAL COST PER ROUTE MILE	$444.4	$396.2	$576.2

Capital cost estimate disaggregated by ROW, guideway, stations, yards, and vehicles on a cost per mile basis

At-Grade Emphasis LRT Alternative Option B has the lowest capital cost per route mile because it has the least amount of track mileage underground and only one underground station. Option A has a higher cost per route mile because there it has one additional underground station and more underground tracks. The Underground Emphasis LRT Alternative is almost entirely underground and has three underground stations, resulting in the highest capital costs.

7.9 Goal 7: Provide a Safe and Secure Alternative Transportation System

- Secure entire alignment, stations, track and other facilities
- Develop direct and indirect safety measures that exceed safety precautions typical of the Metro system
- Develop a system that balances the need for accessibility and mobility with security
- Develop a system that uses accessibility and mobility as measures for safety and security

7.9.1 Initial Screening Criteria

The initial screening criteria for Goal 7, its associated performance measures, and results of the findings for the two build, the No Build, and the TSM alternatives are presented in Table 7-14. Subsequent sections explain each performance measure and the results of each alternative.

Table 7-14 Provide a Safe and Secure Alternative Transportation System Initial Screening Criteria

Goal	Performance Measure	At-Grade		Underground
		Option A	Option B	
7	Safety - determined to be able to provide measures typical of requirements per ADA, per typical CPUC requirements, fire life safety guidelines, and per Metro Design Guidelines for access to and from stations (amount grade separated) (Score 1-worst to 5-best)	2	1	5
	Total underground - new tunnel, existing 2nd St. tunnel, and aerial	46%	38%	94%
7	Number of emergency facilities located within 1/4 mile of the alignment (i.e., fire stations, police stations, hospitals)	4	4	4
7	Number of public events within 1/4 mile of alignment	14	14	14

Safety- determined to be able to provide measures typical of requirements per ADA, typical CPUC requirements, fire life safety guidelines and Metro Design Guidelines for access to and from stations

The measures used to evaluate the build alternatives included the percentage of the alignment that was fully grade separated and the percentage of the alignment totally underground in a new tunnel or in the existing 2nd St. tunnel. It is generally assumed that the more grade separated the alignment, the 'more safe and secure' it will be. Based on that assumption, the underground alternative received the best score, with 94 percent of the line underground, as opposed to the at-grade alternative Option A which is 46 percent underground and Option B which is 38 percent underground.

Number of emergency facilities located within one-quarter mile of the alignment, (i.e. fire stations, police stations, hospitals, etc.)

Both build alternatives have four emergency facilities located within their one-quarter mile buffer, three fire stations and one police station.

Number of public events

Currently, there are a total of 14 annually scheduled public events within one-quarter mile of the at-grade and underground alternatives, including 12 street closures and two additional annual events. These public events include the Little Tokyo Cherry Blossom Festival, the Los Angeles Marathon, Fiesta Broadway, City of Angels Half-Marathon, El Grito Celebration, and the St. Patrick's Day Parade.

7.9.2 Final Screening Criteria

The final screening criteria developed for Goal 7 and its associated performance measures are presented in Table 7-15. The results of the findings for the two build, No Build, and TSM alternatives are presented in subsequent sections.

Table 7-15 Provide a Safe and Secure Alternative Transportation System Final Screening Criteria

Goal	Performance Measure	At-Grade		Underground
		Option A	Option B	
7	Number of crossings with high pedestrian activities on a daily basis	10	10	1
7	Number of events along the alignment	14	14	14
7	Potential issues related to accessibility and line of sight for pedestrians and vehicle drivers (Score 1-worst to 5-best)	1	1	4

Number of crossings with high pedestrian activities on a daily basis

The at-grade alternative has considerably more intersections with high pedestrian activity, 10 total, due to its at-grade configuration and its location along a pedestrian heavy corridor, specifically along 2nd St. The pedestrian activity along 2nd St. is not limited to

Civic Center purposes, but includes the historic and art buildings along 2nd St. as well. Many people walk along 2nd St. and up and down Main and Los Angeles Streets, especially during weekday lunch hour. In addition, because Civic Center buildings are all centrally located, people walk during most of the day to and from different departments.

The underground alternative would affect one intersection, 1st St. and Alameda St. In the past, this was a predominantly vehicle and truck heavy only intersection, but with the recent addition of residential developments along Alameda St. and the Arts District, and with the future Metro Goldline Extension and mixed-use development, this will be a pedestrian heavy intersection.

Number of events along the alignment

See Section 7.9.1 for a description of public events.

Number of potential issues related to accessibility and line of sight for pedestrian and vehicle drivers

An at-grade LRT may have a higher number of potential issues related to accessibility and line of sight for pedestrians and vehicles. An at-grade LRT introduces a new, fixed, transit route that drivers may not be accustomed to. Train movements and signal operations may be unfamiliar and cause initial confusion or uncertainty. Likewise, for pedestrians, an at-grade LRT presents safety concerns due to train speeds, track crossings, and/or proper notifications for oncoming trains. For these and other reasons, the at-grade alternative receives a low score in terms of potential issues that may arise.

The underground alternative presents fewer concerns for pedestrians and street vehicular traffic due to its underground configuration throughout much of the alignment, with the exception of the 1st St. and Alameda St. intersection. Some potential issues at this intersection include through-traffic ability, driver confusion, proper signage for turning movements, and vehicle approaching train signals. There are various features of the underground alignment that will facilitate both vehicular and pedestrian movements. The underpass for north-south traffic removes the vehicular activity from street level to underground, leaving only the LRT and local traffic movements. In addition, the introduction of a pedestrian bridge provides pedestrians with the option to move from street level to an upper platform space. For this reason, the underground alternative received a high score with respect to potential accessibility issues.

7.10 Summary of Recommendations

After the screening of alternatives from eight build alternatives to two build alternatives, a number of refinements were made to both alternatives with input from the community and stakeholders. Much of the input received was regarding the impacts to the Little Tokyo community, connections to a potential historic trolley line on Broadway, and a connection to the Grand development. The addition of a new underpass and pedestrian bridge for both alternatives help to address some key concerns. Continued engineering refinement and coordination with the stakeholders during the next phase of this process will help resolve any remaining issues.

At this point, both build alternatives are viable and can be constructed. However, the Underground Emphasis LRT Alternative has a greater benefit in the long term. This segment will be the core of the light rail system for the PSA and the region as a whole. A high number of trains will be traversing this nearly two-mile segment to go north, south, east or west in the County. The Underground Emphasis LRT Alternative avoids surface conflicts with autos and pedestrians which is beneficial both from a safety standpoint as well as an operational standpoint, as one unplanned stop by a train could cause significant delays for riders in different parts of the County.

Still, the Underground Emphasis LRT Alternatives creates some significant short term impacts to the culturally sensitive Little Tokyo community. This community has a lot to gain in the long run as it will be at the core for public transit in the region. However, there is a concern that Little Tokyo business and therefore Little Tokyo itself will be significantly impacted during construction. Specific considerations for this community will need to be reviewed during the next phase, the Draft EIR/EIS. Therefore, both build alternatives are recommended for further study in a Draft EIR/EIS to evaluate potential impacts and mitigation and to further engineer the details for each option.

7.11 Tradeoffs between Alternatives

Table 7-16 provides a summary comparison of the build alternatives that will be carried on to the next phase for full environmental review. The No Build and TSM Alternatives are required by the state and federal processes to be included in the environmental review as well.

Due to the regional significance of this central 1.8-mile connection, both alternatives will provide substantial mobility and accessibility improvements, consistent with Goal 3. However, due to the volume of potential conflicts with autos that an at-grade alternative provides, and considering that such conflicts would generate substantial interruptions for existing transit operations in the region, the Underground Emphasis LRT Alternative would perform the best, with only one potential conflict location. In addition, the Underground Emphasis LRT Alternative provides better travel times and in turn attracts more riders due to the avoidance of at-grade traffic conditions and at-grade traffic signals.

The cost for either project is significant due to the urban and built out character of the PSA. Both alternatives have substantial portions below-grade, with the At-Grade Emphasis LRT Alternative below-grade for more than 40 percent of the alignment. The capital cost differential between the two alternatives is approximately $200 million, but the O&M cost between the two alternatives is substantially different. The At-Grade Emphasis LRT Alternative will require additional vehicles to account for the slower speeds through downtown LA due to traffic conditions. Additional costs will also be incurred by the maintenance of at-grade components, including track repair, OCS maintenance, station cleaning and station facility repairs. As both alternatives score well using FTA criteria for transit system user benefits, either alternative would be financially feasible.

Table 7-16 Summary Comparison of Alternatives			
Goal	At-Grade Alt – Option A	At-Grade Alt – Option B	Underground Alt
1: Community Planning	Similar demographic characteristics, transit oriented design policies, connections to activity centers, and redevelopment opportunities under all build alternatives.		
2: Public Involvement, Community Preservation	- Smaller proportion of alignment is grade separated - Similar urban fit and potential disproportionate environmental justice effects compared to Underground Emphasis LRT Alt. - One more acquisition needed than Underground Emphasis LRT Alt.		-Greater proportion of alignment is grade separated. -Similar urban fit and potential disproportionate environmental justice effects compared to At-Grade Emphasis LRT Alt. -One fewer acquisition needed than At-Grade Emphasis LRT Alt.
3: Improve Mobility and Access	-8,900 daily hours of transportation user benefits -Union Station to Pico in 14 minutes (3 faster than No Build) -Easily adapted for further system expansions	-9,900 daily hours of transportation user benefits -Union Station to Pico in 14 minutes (3 faster than No Build) -Easily adapted for further system expansions	-12,100 daily hours of transportation user benefits -Union Station to Pico in 12 minutes (5 faster than No Build) -Not easily adapted for further system expansions
4: Improve Environmental Quality	Slightly more impacts than Underground Emphasis LRT Alt. to biological, social, and physical resources after mitigation		Slightly fewer impacts than At-Grade Emphasis LRT Alt. to biological, social, and physical resources after mitigation
5: Cost Effectiveness	-Operating Costs: $9.8M/yr -Annualized cost per hour of user benefit: $24.75	-Operating Costs: $9.6M/yr -Annualized cost per hour of user benefit: $20.36	-Operating Costs: $5.2M/yr -Annualized cost per hour of user benefit: $18.63
6: Financial Feasibility	-Capital Costs: $796M ($424M per mile) -Low eligibility for federal/state/local funds	-Capital Costs: $709M ($339M per mile) -Moderate-Low eligibility for federal/state/local funds	-Capital Costs: $910M ($414M per mile) -Moderate-Low eligibility for state/local funds -High eligibility for federal funds
7: Safety and Security	-10 high-activity grade crossings -Many potential issues related to accessibility and vehicle line of sign -Similar number of public events along the alignment, compared to Underground Emphasis LRT Alt.		-1 grade crossing -Few potential issues related to accessibility and vehicle line of sight -Similar number of public events along the alignment, compared to At-Grade Emphasis LRT Alt.

The build alternatives meet one of two distinct criteria important to the general community. The Underground Emphasis LRT Alternative addresses the desire for the project to be primarily, if not entirely, underground. The At-grade Emphasis LRT Alternative addresses the desire for an alternative that does not directly impact the community of Little Tokyo by traversing Temple, Los Angeles and Main Streets instead. Though the Underground Emphasis LRT Alternative avoids directly conflicting with Little Tokyo's busy streets and businesses, this alternative features a single at-grade crossing at Alameda and 1st Streets, and potential impacts to Little Tokyo are still a great concern.

After initial screening, Metro worked closely with a special task force created within the Little Tokyo community, as well as with major stakeholders within the historic core, financial district, Bunker Hill and the Civic Center. The decision to include underpasses for intersections at Temple and 1st St., and to include a pedestrian bridge for both alternatives, has led to support from the Little Tokyo community for both alternatives. In addition, the historic core will continue to be involved in the potential fourth station at 2nd and Spring Streets and the final location of an underground station on 2nd St., in order to best enhance a connection to a proposed street-car on Broadway. Both alternatives score well based on support for community planning efforts.

Based on the comparative analysis, the following alternatives are being recommended for consideration for future study in a Draft EIR/EIS process:

- No Build (required)
- Transportation System Management (TSM) (required)
- At-Grade Emphasis LRT (including Alameda underpass and pedestrian bridge at Temple Street)
- Underground Emphasis LRT (including Alameda underpass and pedestrian bridge at 1st Street)

These alternatives are considered the best alternatives that meet the Purpose and Need for the Regional Connector Transit Corridor and are the most competitive for possible Federal New Starts funding participation.

The following issues will continue to be addressed during development of the Draft EIR/EIS and the selection of the Locally Preferred Alternative (LPA). The LPA will be submitted to the Federal Transit Administration as the project Metro recommends for Preliminary Engineering.

- Design of auto underpasses, pedestrian crossings, and pedestrian bridges for both build alternatives
- Decision about specific location and configuration of stations
- Decision about a possible fourth station for the At-Grade Emphasis LRT

- Impact identification and proposed mitigation for construction and operations
- Costs
- Evaluation of the cost effectiveness of project elements

Appendix B Transit Lines Serving the Project Study Area

Operator	Line	Mode	Weekday Hours of Operation	Peak Hour Frequency	Route Description
AVTA	785	Freeway Express Bus	4AM-6AM, 3PM-6PM	20 mins	Palmdale/Lancaster
BBB	10 Express	Freeway Express Bus	6AM-8PM	15 mins	Santa Monica
Gardena	1	Freeway Express Bus	5AM-12AM	15 mins	Gardena/Lawndale
Foothill	481	Freeway Express Bus	6AM-9AM, 3PM-6PM	20 mins	El Monte/Wilshire Center
Foothill	493	Freeway Express Bus	5AM-8AM, 2PM-8PM	10 mins	Pomona/Phillips Ranch
Foothill	497	Freeway Express Bus	5AM-8AM, 2PM-7PM	12 mins	Chino
Foothill	498	Freeway Express Bus	5AM-8AM, 2PM-7PM	7 mins	Covina/Azusa
Foothill	499	Freeway Express Bus	5AM-8AM, 2PM-7PM	12 mins	San Dimas
Foothill	699	Freeway Express Bus	4AM-8AM. 2PM-7PM	9-12 mins	Montclair
Foothill	Silver Streak	Freeway Express Bus	24 Hours	10 mins	Montclair
LADOT	CE 409	Freeway Express Bus	6AM-9AM, 4PM-6PM	15 mins	Sylmar/Sunland/Tujunga/Montrose/Glendale
LADOT	CE 413	Freeway Express Bus	7AM-9AM, 4PM-6PM	25 mins	Van Nuys/North Hollywood/Burbank
LADOT	CE 419	Freeway Express Bus	7AM-9AM, 4PM-7PM	15 mins	Chatsworth/Northridge/Granada Hills/Mission Hills
LADOT	CE 422	Freeway Express Bus	5AM-9AM, 4PM-8PM	8 mins	Hollywood/San Fernando Valley/Agoura Hills/Thousand Oaks
LADOT	CE 423	Freeway Express Bus	7AM-9AM, 4PM-7PM	15 mins	Encino/Woodland Hills/Agoura Hills/Thousand Oaks/Newbury Park
LADOT	CE 430	Freeway Express Bus	6AM-7AM, 5PM-6PM	30-50 mins	Brentwood/Pacific Palisades
LADOT	CE 431	Freeway Express Bus	7AM-9AM, 5PM-6PM	30 mins	Westwood/Rancho Park/Palms
LADOT	CE 437	Freeway Express Bus	7AM-9AM, 4PM-6PM	15-30 mins	Venice/Marina del Rey/Culver City
LADOT	CE 438	Freeway Express Bus	7AM-9AM, 4PM-6PM	15 mins	Redondo Beach/Hermosa Beach/Manhattan Beach/El Segundo
LADOT	CE 448	Freeway Express Bus	7AM-9AM, 4PM-6PM	15 mins	Rancho Palos Verdes/Torrance/Lomita/Wilmington Harbor City
LADOT	CE 534	Freeway Express Bus	7AM-8AM, 4PM-5PM	30 mins	Century City/Westwood
LADOT	DASH A	Circulator Bus	7AM-7PM	7 mins	Little Tokyo/City West
LADOT	DASH B	Circulator Bus	6AM-7PM	8 mins	Chinatown/Financial District
LADOT	DASH C	Circulator Bus	7AM-7PM	7 mins	Financial District/South Park

Operator	Line	Mode	Weekday Hours of Operation	Peak Hour Frequency	Route Description
LADOT	DASH D	Circulator Bus	6AM-7PM	5 mins	Union Station/South Park
LADOT	DASH E	Circulator Bus	7AM-7PM	5 mins	City West/Fashion District
LADOT	DASH F	Circulator Bus	7AM-7PM	10 mins	Financial District/Exposition
LADOT	DASH CH	Circulator Bus	6AM-6PM	6 mins	City Hall Shuttle
LADOT	DASH DD	Circulator Bus	Weekend Only	20 mins	Downtown Discovery
LADOT	DASH MBH	Circulator Bus	7AM-9AM, 3PM-6PM	10 mins	Metrolink/Bunker Hill
Metro	2/302	Local/Limited Stop Bus	24 Hours	5 mins	Pacific Palisades via Sunset Bl.
Metro	4	Local Bus	24 Hours	7 mins	Santa Monica via Santa Monica Bl.
Metro	10	Local Bus	5AM-12AM	7 mins	West Hollywood via Temple St. and Melrose Av.
Metro	14/37	Local Bus	24 Hours	10 mins	Beverly Hills via Beverly Bl./West LA via Adams Bl.
Metro	16/316	Local/Limited Stop Bus	4AM-1AM	3 mins	Century City via 3rd St.
Metro	18	Local Bus	24 Hours	3 mins	Wilshire Center - Montebello via 6th St. and Whittier Bl.
Metro	20	Local Bus	24 Hours	4 mins	Santa Monica via Wilshire Bl.
Metro	26/51/52/352	Local/Limited Stop Bus	24 Hours	4 mins	Hollywood - Compton - Artesia Blue Line via Avalon Bl.
Metro	28	Local Bus	5AM-1AM	8 mins	Century City via Olympic Blvd.
Metro	30/31/330	Local/Limited Stop Bus	24 Hours	4 mins	Pico-Rimpau - Monterey Park via Pico Bl and E 1st St.
Metro	33/333	Local/Limited Stop Bus	24 Hours	2 mins	Santa Monica via Venice Bl.
Metro	38	Local Bus	24 Hours	8 mins	Fairfax and Washington via Jefferson Bl.
Metro	40	Local Bus	24 Hours	6 mins	South Bay Galleria via Hawthorne Bl., Crenshaw Bl., and MLK Bl.
Metro	42/42A	Local Bus	5AM-12AM	12 mins	LAX via MLK Bl., Stocker St., and La Tijera Bl.
Metro	45	Local Bus	24 Hours	6 mins	Montecito Heights - Rosewood via Broadway and Mercury Av.
Metro	48	Local Bus	5AM-11PM	7 mins	Avalon Green Line via Main St. and S. San Pedro St.
Metro	53/350	Local/Limited Stop Bus	24 Hours	5 mins	Carson via Central Av.
Metro	55/355	Local/Limited Stop Bus	24 Hours	4 mins	Imperial Blue/Green Line via Compton Av.
Metro	60	Local Bus	24 Hours	6 mins	Artesia Blue Line via Long Beach Bl.

Operator	Line	Mode	Weekday Hours of Operation	Peak Hour Frequency	Route Description
Metro	62	Local Bus	5AM-11PM	15 mins	Hawaiian Gardens via Telegraph Rd.
Metro	66/366	Local/Limited Stop Bus	4AM-1AM	2 mins	Wilshire Center - Montebello via 8th St. and Olympic Bl.
Metro	68/84	Local Bus	24 Hours	8 mins	West LA - Montebello via Washington Bl. and Cesar Chavez Av.
Metro	70/71/370	Local/Limited Stop Bus	24 Hours	5-9 mins	El Monte via Garvey Av.
Metro	76/376	Local/Limited Stop Bus	24 Hours	10 mins	Arcadia via Valley Bl., Huntington Dr. and Las Tunas Dr.
Metro	78/79/378	Local/Limited Stop Bus	5AM-1AM	10 mins	Arcadia via Huntington Dr. and Las Tunas Dr.
Metro	81/381	Local/Limited Stop Bus	5AM-1AM	5 mins	Eagle Rock - Exposition Park via Figueroa St.
Metro	83	Local Bus	24 Hours	10 mins	Eagle Rock via York Av.
Metro	90/91	Local Bus	5AM-12AM	10 mins	Sunland via Foothill Bl., Cañada Bl., and Glendale Av.
Metro	92	Local Bus	24 Hours	12 mins	Burbank via Glendale
Metro	94/394	Local/Limited Stop Bus	5AM-1AM	5 mins	Sylmar via San Fernando Rd. and Spring St.
Metro	96	Local Bus	5AM-8PM	20 mins	Sherman Oaks via Griffith Park Dr. and Riverside Dr.
Metro	439	Freeway Express Bus	5AM-9PM	40-60 mins	Aviation Green Line via Culver City
Metro	442	Freeway Express Bus	6AM-8AM, 4PM-6PM	30 mins	Hawthorne via Harbor Transitway, Manchester Bl., and La Brea Av.
Metro	444	Freeway Express Bus	5AM-8PM	10-20 mins	Rancho Palos Verdes via Harbor Transitway and Hawthorne Bl.
Metro	445	Freeway Express Bus	5AM-7PM	30 mins	San Pedro via Harbor Transitway, 1st St., and Pacific Av.
Metro	446/447	Freeway Express Bus	5AM-12AM	15 mins	San Pedro via Harbor Transitway, Avalon Bl., and Pacific Av.
Metro	450X	Freeway Express Bus	6AM-9AM, 4PM-6PM	15 mins	South Bay Express via Harbor Transitway
Metro	460	Freeway Express Bus	5AM-12AM	30 mins	Disneyland via Harbor Transitway, I-105, and I-5
Metro	484	Freeway Express Bus	5AM-12AM	5 mins	Pomona via El Monte Busway and Valley Bl.
Metro	485	Freeway Express Bus	5AM-12AM	20 mins	Altadena via El Monte Busway, Oak Knoll Av., and Lake Av.
Metro	487	Freeway Express Bus	6AM-9PM	30 mins	Sierra Madre Villa Gold Line via El Monte Busway
Metro	489	Freeway Express Bus	6AM-8AM, 3PM-5PM	12 mins	Temple City via El Monte Busway and Rosemead Bl.
Metro	490	Freeway Express Bus	5AM-11PM	10 mins	Pomona via El Monte Busway and Ramona Bl.
Metro	704	Rapid Bus	6AM-8PM	8 mins	Santa Monica Bl. Rapid

Operator	Line	Mode	Weekday Hours of Operation	Peak Hour Frequency	Route Description
Metro	714	Rapid Bus	6AM-9AM, 3PM-6PM	15 mins	Beverly Bl. Rapid
Metro	720	Rapid Bus	4AM-1AM	4 mins	Wilshire Bl. - Whittier Bl. Rapid
Metro	728	Rapid Bus	5AM-8PM	8 mins	Olympic Bl. Rapid
Metro	740	Rapid Bus	5AM-8PM	10 mins	Hawthorne Bl. Rapid
Metro	745	Rapid Bus	5AM-8PM	5 mins	South Broadway Rapid
Metro	760	Rapid Bus	5AM-8PM	8 mins	Long Beach Bl. Rapid
Metro	770	Rapid Bus	6AM-6PM	12 mins	Garvey Av. - Cesar Chavez Av. Rapid
Metro	940	Rapid Express Bus	6AM-8AM, 4PM-6PM	30 mins	Hawthorne Bl. Rapid Express
Metro	Blue Line	Light Rail	5AM-12AM	5 mins	Long Beach via South Los Angeles, Willowbrook, and Compton

1.0 INTRODUCTION

The Los Angeles County Metropolitan Transportation Authority (Metro) has completed an Alternatives Analysis (AA) and is moving forward with the preparation of a Draft Environmental Impact Statement/Environmental Impact Report (DEIS/DEIR) for the Regional Connector Transit Corridor project. Metro is serving as the lead agency for purposes of the California Environmental Quality Act (CEQA) environmental clearance, and the Federal Transit Administration (FTA) is serving as lead agency for purposes of the National Environmental Policy Act (NEPA).

The project has been organized into two phases or stages. Stage 1 consists of the AA, including conceptual engineering and preparation of the DEIS/DEIR, which will lead to the selection of a Locally Preferred Alternative (LPA). Stage 2, consists of the preparation of the Final EIS/EIR (FEIS/FEIR). The project will be conducted in accordance with the most recent FTA guidelines for project development and Section 5309 New Starts, and all environmental documentation prepared will satisfy the requirements of NEPA and CEQA.

The Regional Connector Transit Corridor is proposed to create a connection in downtown Los Angeles that will link the Metro Blue Line terminus at the 7th Street/Metro Center LRT Station to the Metro Gold Line Eastside Station at 1st and Alameda streets. This connection will provide through service between the Metro Blue Line, Metro Gold Line Pasadena, Metro Gold Line Eastside, and Metro Exposition Line light rail corridors. With the implementation of the Regional Connector Transit Corridor project, these four lines will link at a station in Downtown Los Angeles. The result of this connection will be enhanced regional connectivity by providing continuing operation from Azusa to Long Beach and Santa Monica to Interstate 605 (I-605) without the need to transfer, thus making it easier for potential riders to get to and from Downtown Los Angeles.

The project area is primarily in the Los Angeles central business district. The 1.6 square mile study area includes Little Tokyo, Central City East, Toy District, Financial Core, Historic Core, Jewelry District, Bunker Hill, Civic Center, and the Fashion District and is bounded by the I-110 freeway to the west and north, Alameda Street to the east, and 9th and 7th Street to the south.

1.1 Purpose of the Financial Report

This financial report supports the Stage 1 development of the DEIS/DEIR and the selection of an LPA. The purpose of the financial report is to compare the capital and operating and maintenance (O&M) costs and revenues associated with the alternatives under consideration for the Regional Connector Transit Corridor project. The alternatives being evaluated in the DEIS/DEIR include a No Build, Transportation Systems Management (TSM) and three Build Alternatives. The Build Alternatives reflect an At-Grade Emphasis Light Rail Transit (LRT) Alternative; the Underground Emphasis LRT Alternative and the Fully Underground LRT

Alternative, which includes two alignment variations. Descriptions of the alternatives are provided in Section 1.2.

Following the selection of the LPA and as part of the project Stage 2 activities, the financial analysis will reflect the development of a detailed financial plan for the LPA. The purpose of the detailed financial plan is to document Metro's financial capacity to construct and operate the Regional Connector consistent with FTA requirements for grants awarded under the Section 5309 New Starts Program. This document will assist the FTA, Metro, other City Officials and the general public in the understanding and evaluation of Metro's financial capacity to construct the Regional Connector Transit Corridor as well as the agency's capacity to operate and maintain the existing transit system.

1.2 Description of Alternatives

The following provides an overview of the alternatives under consideration in the DEIS/DEIR.

1.2.1 No Build Alternative

The No-Build Alternative includes all existing transportation facilities as well as all committed transportation projects outlined in the Metro Long Range Transportation Plan (LRTP) (2009) and the Southern California Association of Governments (SCAG) Regional Transportation Plan (RTP) (2004). This includes the Metro Gold Line Eastside Extension opened in 2009, and the first and second phase of the Metro Exposition Line scheduled to open in 2010. An update to Metro's LRTP was released for public review in March 2008 and was finalized and approved by Metro's Board in November 2009. The No Build Alternative would preserve existing service levels, as well as the projects listed in the LRTP and RTP.

1.2.2 TSM Alternative

The TSM Alternative includes all services defined in the No Build Alternative plus two new express shuttle bus lines that would provide frequent service between the 7th Street/Metro Center LRT Station and Union Station (see Figure 1-1). The buses may also have traffic signal priority similar to the Metro Rapid system, where the traffic signal control system grants longer green time to ongoing vehicles. Enhanced transit stops would be located every two to three blocks to maximize coverage of the area surrounding the routes.

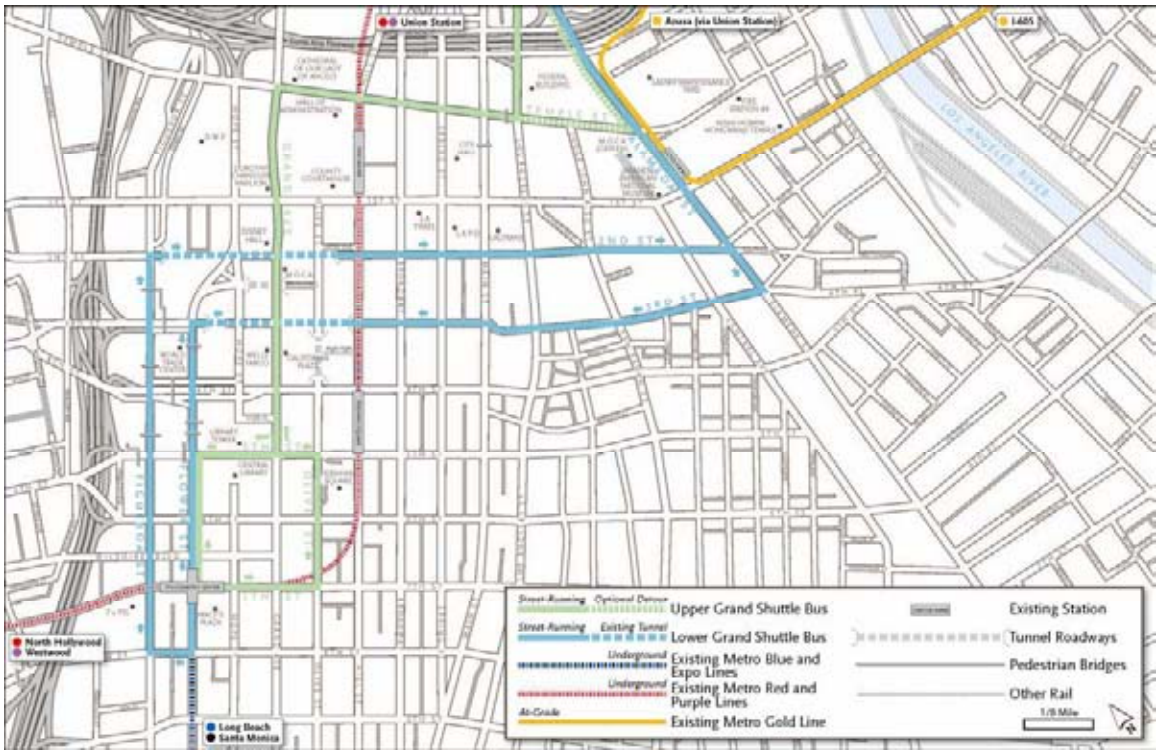

Figure 1-1: TSM Alternative

1.2.3 At Grade Emphasis LRT Alternative

As shown in Figure 1-2, the At-Grade Emphasis LRT Alternative would begin at the existing 7th Street/Metro Center LRT station and would continue north on Flower Street in a cut-and-cover tunnel to a portal just south of 4th Street where it would rise to the street surface and cross 3rd Street at-grade before turning slightly to the east and entering a second cut-and-cover tunnel just north of 3rd Street. The second tunnel would continue to the existing 2nd Street vehicular tunnel where it would break into its south wall and continue east in the tunnel, along its southern side, requiring the removal of one traffic lane. East of the tunnel portal at Hill Street, the LRT would occupy the south side of 2nd Street as an at-grade double track line to Main Street where the southbound track would follow the east side of Main Street to Temple Street, and the eastbound track would continue on 2nd Street before turning north along the easterly side of Los Angeles Street to Temple Street.

At the intersection of Temple and Main Streets, the southbound track would turn east on Temple down the center of the street to Los Angeles Street, where it would be joined by the northbound track. The tracks would continue in the center of Temple Street to San Pedro Street, where both tracks would transition to the south side of the street and continue to Alameda Street. At this point a double track wye junction would be built with the existing Metro Gold Line Eastside Extension. Since this rail junction would be difficult to operate in-

street, it is proposed to build an underpass for Alameda Street which would minimize Temple Street traffic conflicts with LRT movements.

Three stations are planned for this alternative

- Flower/6th/5th Street Station: an underground side-platform station located on Flower Street between 6th Street and 5th Street.
- 2nd/Hope Street Station: an underground center platform station would be located in a parkway area just southwest of the intersection of 2nd and Hope Streets.
- Los Angeles/1st Street Station and Main/1st Street Station: This split couplet station would be located on Main and Los Angeles Streets just north of 1st Street. The northbound platform would be on the eastern side of Los Angeles Street, and the southbound platform would be on the eastern side of Main Street.

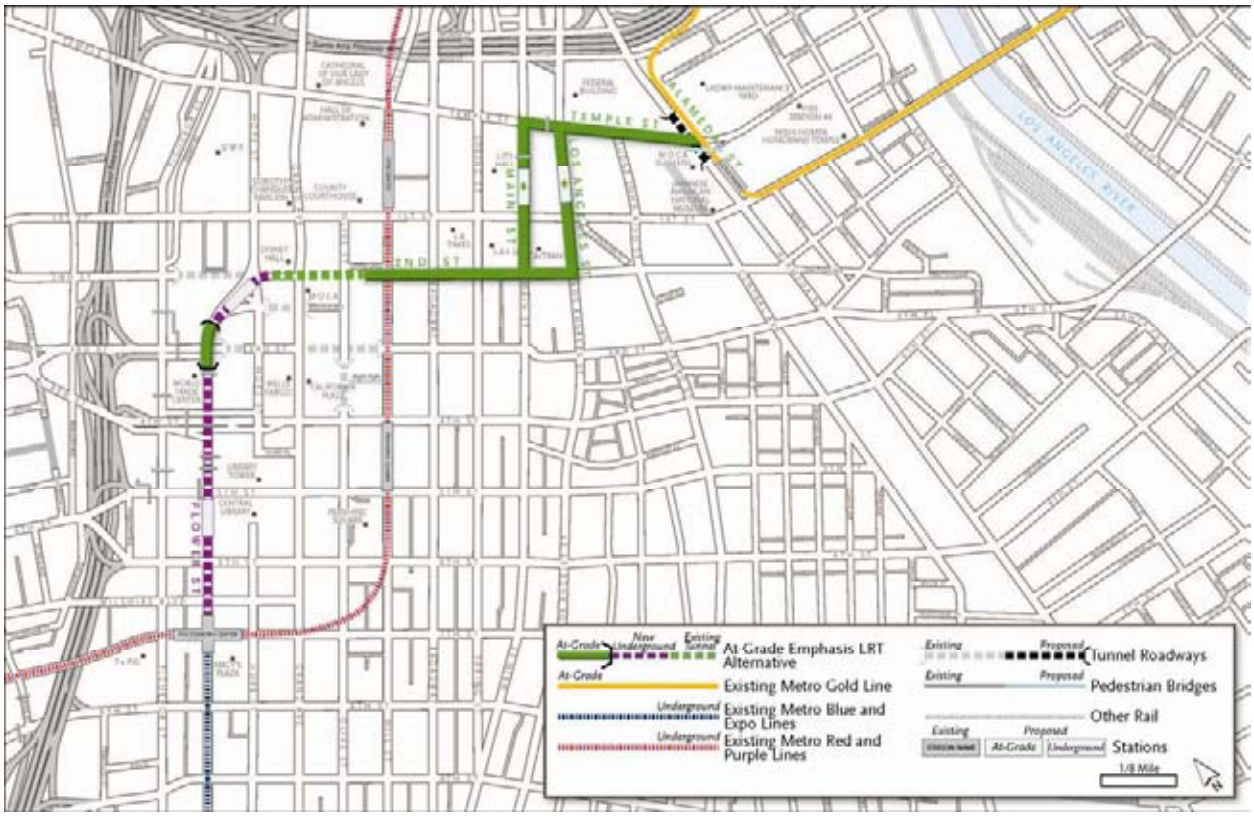

Figure 1-2: At-Grade Emphasis LRT Alternative

1.2.4 Underground Emphasis LRT Alternative

Figure 1-3 shows the Underground Emphasis LRT Alternative. This alternative would begin at the end of the existing 7th Street/Metro Center LRT station just south of 6th Street and would continue north on Flower Street in a cut-and cover tunnel to just north 4th Street where it

would continue as a mined tunnel or cut and cover tunnel to Hope Street, curving in an easterly direction north of 3rd Street. Easter of Hope Street the alignment would continue in a bored tunnel under 2nd Street to just west of Central Avenue, where cut-and-cover construction would bring the tracks closer to the surface, allowing a portal to be located just east of the centerline of Central Avenue. The tracks would rise to the surface diagonally on private property between the intersections of 2nd Street/Central Avenue and 1st Street/Alameda Street, at which point a double track wye junction would be constructed with the existing Metro Gold Line Eastside Extension. Since this rail junction would be difficult to operate in-street, it is proposed to build an underpass for Alameda Street, which would minimize 1st Street traffic conflicts with LRT movements.

Three stations locations are planned for this alternative. As described below there are two options still under consideration for the third location:

- Flower/5th/4th Street Station: An underground side-platform station located on Flower Street between 5th Street and 4th Street
- 2nd/Hope Street Station: An underground center platform station in the hillside area just southwest of 2nd and Hope Streets
- 2nd Street Station: An underground center platform station on 2nd Street either between Main and Los Angeles Streets (2nd Street Station/Los Angeles Option) or between Broadway and Spring Street (2nd Street Station/Broadway Option)

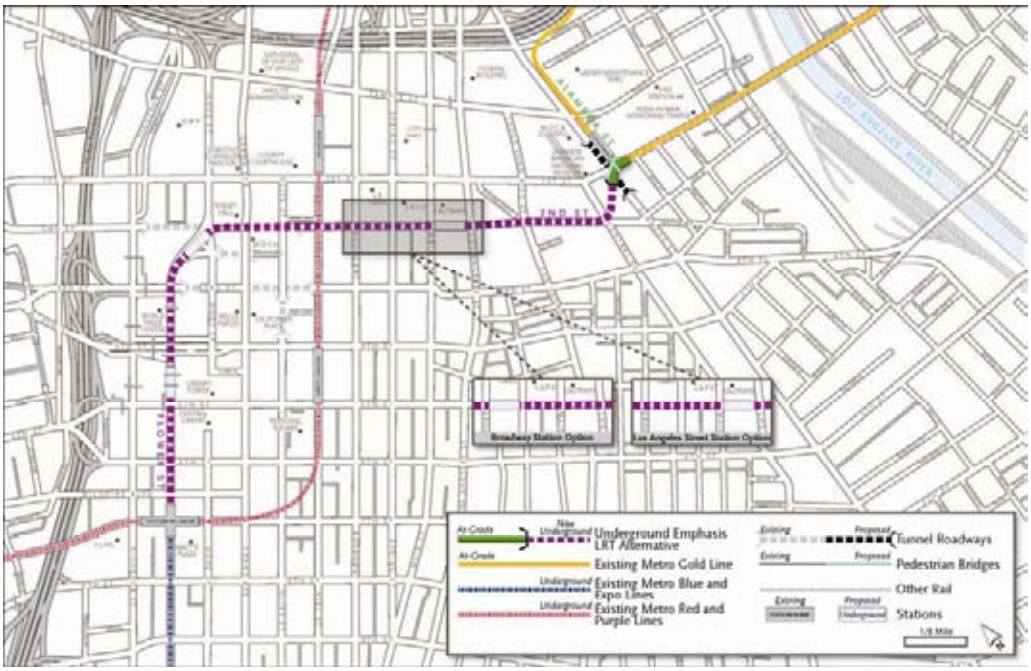

Figure 1-3: Underground Emphasis LRT Alternative

1.2.5 Fully Underground LRT Alternative

Figure 1-4 shows the Fully Underground LRT Alternative. As shown on the figure, the Fully Underground LRT Alternative is underground from east of the intersection of 1st and Alameda Streets to the 7th Street/Metro Center LRT Station.

Additionally, two alignment variations are located beyond the 1st and Alameda intersection:

- Little Tokyo Variation 1: This alignment variation would provide four new stations and a direct connection from the 7th Street/Metro Center LRT Station to the existing Metro Gold Line tracks to the north and east of 1st and Alameda Streets. The alignment would extend fully underground from the 7th Street/Metro Center LRT Station under Flower Street to 2nd Street. The tracks would then proceed east underneath the 2nd Street Tunnel and 2nd Street to Central Avenue. At 2nd and Central, the tracks continue underground heading to northeast under 1st and Alameda Streets. A three-way (wye) junction would be constructed underground beneath the 1st and Alameda intersection. To the north and east of the junction, trains would rise to the surface through two new portals to connect the Metro Gold Line heading north to Azusa and east to I-605.

- Little Tokyo Variation 2: This alignment variation is similar to Variation 1 until the 1st and Alameda Street intersection. At this intersection a new two-level track junction would be constructed. Trains travelling north toward Azusa and east to I-605 would use the lower level of the junction, and trains south towards Long Beach would and west towards Santa Monica would use the upper level. To the north and east of the junction, trains would rise to the surface through two new portals to connect the Metro Gold Line heading north to Azusa and east to I-605.

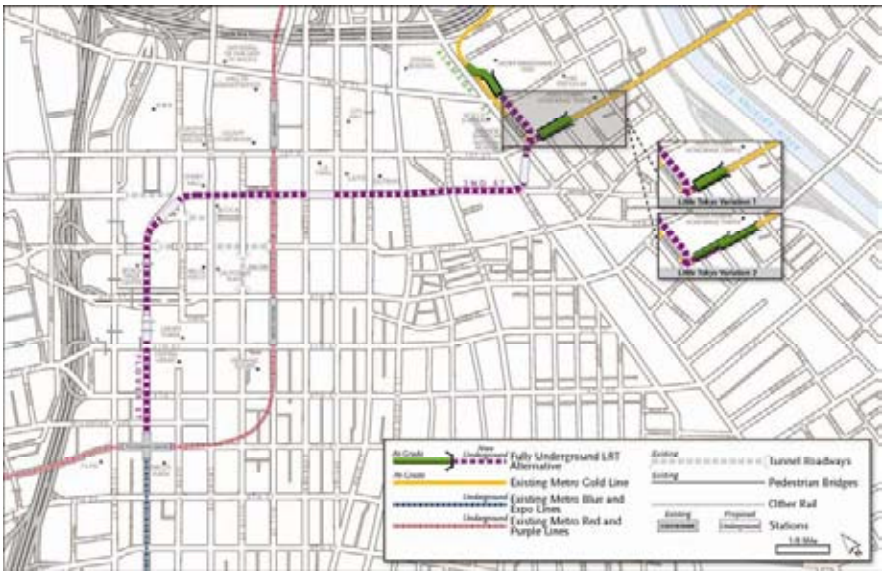

Figure 1-4: Fully Underground LRT Alternative

1.3 Contents of this Report

The remainder of this report reflects the following:

- Section 2 of this report focuses on the capital costs of the alternatives. Costs are presented in both base year and Year of Expenditure (YOE) dollars using annual inflation rates and the project's current implementation schedule. In order to understand the financial impact of actual funds that would need to be expended in the actual year of expenditure and the relative effects of inflation on costs and revenues, an inflation rate is used to project from base year dollars to YOE dollars. More specifically, YOE dollar values are computed by multiplying base year dollar values by the compounded escalation factor for the year in which funds would be expended. For example, in YOE dollars, $1.00 in 2010 is equivalent to $1.03 in 2011, using an inflation rate of 3.0 percent.

  Additionally, the capital costs are presented using FTA's Standard Cost Categories (SCC). FTA implemented the SCC to establish a consistent format for the reporting, estimating and managing of capital costs for projects that intend to proceed through the New Starts major capital project development process.

  Finally, this section describes the federal, State, and local capital revenue sources and funding strategies identified to date for the Regional Connector Transit Corridor project.

- Section 3 compares projected O&M costs of the alternatives and projected farebox revenues assuming fares consistent with Metro services and fare payment media. This section also identifies potential system-wide operating savings that could be realized due to improved efficiency of service associated with the selected alternatives. An estimate is also provided of the potential level of operating support required.

- Section 4 summarizes key potential risks and uncertainties that could affect project costs and revenues over the course of the refinement of the Regional Connector financial plan.

- Section 5 reviews key findings of the DEIS/DEIR financial analysis and highlights the differences among the alternatives.

2.0 CAPITAL COSTS AND REVENUES

This section describes the capital costs of the alternatives and the federal, State, and local revenue sources proposed.

2.1 Capital Costs

Capital costs of the alternatives were estimated based on concept drawings developed in 2009 dollars to an approximate 10 percent level of engineering completion. Where the level of design does not support quantity measurements, parametric estimating techniques were utilized. Detail on capital cost estimation is provided in the *Regional Connector Transit Corridor: Final Capital Cost Estimate Report* dated April 12, 2010.

As shown in Table 2-1, capital costs are presented in 2009 constant dollars and in Year of Expenditure dollars inclusive of inflation. The capital costs of the alternatives range from $67.3 million ($80.0 million in YOE dollars) for the TSM Alternative to $1,360.2 million ($1,575.8 million in YOE dollars) for the Fully Underground LRT Alternative – Little Tokyo Variation 2. The YOE cost for the TSM and Build Alternatives reflect the implementation plan assumed in the LRTP. As the Regional Connector's LPA moves through the FTA's major capital project development process the costs and implementation schedule will be further refined.

Table 2-1: Capital Costs Estimates in 2009 Dollars and YOE Dollars ($ in Millions)

Alternative	2009 Dollars	YOE Dollars
TSM	$67.3	$80.0
At Grade Emphasis	$899.2	$1,042.2
Underground Emphasis	$1,120.1	$1,297.0
Fully Underground Little Tokyo - Variation 1	$1,245.2	$1,442.0
Fully Underground Little Tokyo - Variation 2	$1,360.2	$1,575.8

2.1.1 Capital Costs in 2009 Dollars

Table 2 and Figure 5 present the capital costs of the alternatives in 2009 dollars using the FTA's Standard Cost Categories. FTA requires submission of capital costs in the SCC format at key milestones in the major capital project development process, including the application to enter Preliminary Engineering, which will follow selection of the LPA.

FTA's ten required cost categories are:

- 10 Guideway and Track Elements
- 20 Stations, Stops, Terminals, Intermodal
- 30 Support Facilities: Yards, Shops, Administration Buildings
- 40 Sitework and Special Conditions (removal of structures or existing trackwork, utility relocations, roadway modifications, and environmental mitigation)
- 50 Systems (overhead catenaries and communication infrastructure)
- 60 Row, Land, Existing Improvements
- 70 Vehicles
- 80 Professional Services
- 90 Unallocated Contingency
- 100 Finance Charges

Cost categories 10 through 60 are the construction and right of way elements associated with each alternative. Category 70 is the cost of vehicles and includes buses (TSM Alternative) and/or light rail vehicles (Build Alternatives). Categories 80 through 100 represent "soft costs." These costs include allowances for Professional Services (Category 80) such as engineering and design, construction management, agency program management, project management oversight, project implementation, and training/start-up/testing. The allowances are computed by applying a percentage to the total construction cost estimated for each cost category (Categories 10 through 50). The Unallocated Contingency (Category 90) is an overall project contingency, which is typically higher during the early stage of project development and decreases as more detailed planning and engineering is completed. Finally, Finance Charges (Category 100) are estimated if the financial plan for the project includes the issuance of bonds. At this point in the project development process no financing charges have been assumed at this time.

Table 2-2: Capital Cost Estimates by Alternative, by FTA Standard Cost Category (2009 $ in Millions)

FTA Standard Cost Categories	Build LRT Alternatives				
	TSM	At Grade Emphasis	Underground Emphasis	Fully Underground - Little Tokyo Var 1	Fully Underground - Little Tokyo Var 2
10 Guideway and Track Elements	$0.0	$117.2	$160.3	$208.5	$218.0
20 Stations, Stops, Terminals, Etc.	$0.0	$173.6	$301.2	$363.7	$426.2
30 Support Facilities	$21.0	$29.7	$12.5	$6.3	$6.3
40 Sitework and Special Conditions	$0.0	$157.2	$186.6	$163.3	$169.9
50 Systems	$3.1	$34.9	$39.6	$48.3	$48.4
60 ROW, Land, Existing Improvements	$0.0	$52.4	$51.9	$63.6	$63.6
70 Vehicles	$29.1	$83.4	$35.1	$17.6	$17.6
80 Professional Services	$8.0	$169.1	$231.1	$260.7	$286.7
90 Unallocated Contingency	$6.1	$81.7	$101.8	$113.2	$123.7
100 Finance Charges	$0.0	$0.0	$0.0	$0.0	$0.0
Total	**$67.3**	**$899.2**	**$1,120.1**	**$1,245.2**	**$1,360.2**

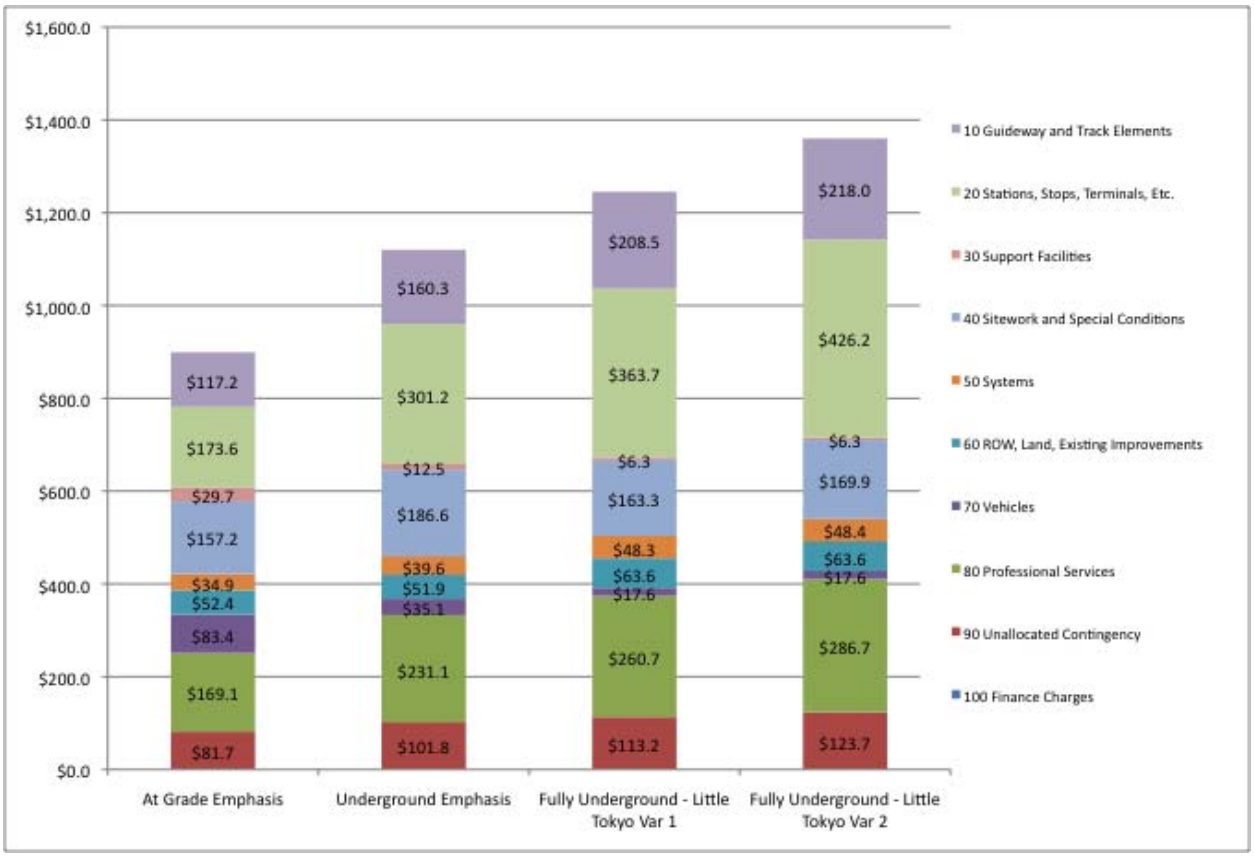

Figure 2-1: Build Alternatives Capital Cost Estimates by Standard Cost Category (2009 $ in Millions)

As shown in Table 2-2 and Figure 2-1, a review of the costs for each alternative reveals:

- **TSM Alternative**: Of the $67.3 million cost of this alternative, approximately $50.1 million (74 percent) is for Support Facilities (31 percent) and Vehicles (43 percent). This reflects the need for a new maintenance facility and a total of 42 new buses. Professional Services account for approximately $8.0 million (12 percent), with $6.1 million (nine percent) for Unallocated Contingency and $3.1 million for Systems (4.6 percent).

- **At-Grade Emphasis LRT Alternative**: Of the $899.2 million cost of this alternative, approximately $512.5 million (57 percent) is related to construction elements, with Stations (19.3 percent) Guideway and Track Elements (13 percent), and Sitework and Special Conditions (17.5 percent) accounting for the majority of the construction costs. Nineteen light rail vehicles would be required for this alternative, which is $83.4 million (9.3 percent) of the total costs. Professional Services account for $169.1 million (18.8 percent), with $81.7 million (9.1 percent) for Unallocated Contingency.

- **Underground Emphasis LRT Alternative**: Similar to the At Grade Emphasis Alternative, of the $1,120.0 million cost of this alternative, approximately $700.2 million (63 percent) is related to construction, with Stations (26.9 percent), Guideway and Track (14.3 percent), and Sitework and Special Conditions (16 percent) accounting for the majority of the construction costs. Eight light rail vehicles would be required for this alternative at a cost of $35.1 million (3.1 percent) of the total costs. Professional Services account for $231.1 million (20.6 percent), with $101.8 million (9.1 percent) for Unallocated Contingency.

- **Fully Underground LRT Alternative – Little Tokyo Variation 1**: Of the $1,245.2 million cost of this alternative, $790.1 million (63 percent) is related to construction, with Stations (29.2 percent), Guideway and Track (16.7 percent), and Sitework and Special Conditions (13 percent) accounting for the majority of the construction costs. Four light rail vehicles would be required for this alternative, which is $17.6 million (1.4 percent) of total costs. Professional Services account for $260.7 (20.9 percent), with $113.2 million (9.1 percent) for Unallocated Contingency.

- **Fully Underground LRT Alternative – Little Tokyo Variation 2**: Of the $1,360.2 million cost of this alternative, $868.7 million (64 percent) is related to construction, with Stations (31.3 percent), Guideway and Track (16 percent), and Sitework and Special Conditions (12.5 percent) accounting for the majority of the construction costs. Four light rail vehicles would be required for this alternative, which is $17.6 million (1.3 percent) of total costs. Professional Services account for $286.7 (21.1 percent), with $123.7 million (9.1 percent) for Unallocated Contingency.

2.1.2 Capital Costs in YOE Dollars

For the YOE cost analysis, capital costs were escalated from 2009 dollars using annual growth rates and a preliminary implementation plan developed by LA Metro staff and team members. The annual and compound growth rates are shown in Table 2-3. In addition to these escalation rates, the percent of project completion by year (cost curve) shown in Table 2-4 was used to estimate the annual cost estimates for the TSM and Build Alternatives.

Table 2-3: Year of Expenditure Dollar Escalation Rates

Fiscal Year	Growth Rate	Compound Annual Growth Rate
2010	1.01	1.010
2011	1.02	1.030
2012	1.03	1.061

Table 2-3: Year of Expenditure Dollar Escalation Rates		
Fiscal Year	**Growth Rate**	**Compound Annual Growth Rate**
2013	1.03	1.093
2014	1.03	1.126
2015	1.03	1.159
2016	1.03	1.194
2017	1.03	1.230
2018	1.03	1.267
2019	1.03	1.305

Table 2-4: Cost Curve Assumptions										
FTA SCC Categories	**FY 11**	**FY 12**	**FY 13**	**FY 14**	**FY 15**	**FY 16**	**FY 17**	**FY 18**	**FY 19**	**Total**
10 Guideways			5.6%	37.9%	32.0%	11.6%	12.9%			100.0%
20 Yards and Shops						13.0%	87.0%			100.0%
30 Systems					1.0%	30.0%	55.0%	13.9%		100.0%
40 Stations			6.1%	19.7%	24.9%	21.4%	26.2%	1.7%		100.0%
50 Vehicles			4.2%	19.8%	22.9%	27.1%	26.0%			100.0%
60 Special Conditions	1.4%	5.4%	21.7%	22.0%	27.0%	14.7%	6.2%	1.6%		100.0%
70 Right-of-Way	2.0%	12.9%	35.0%	50.0%						100.0%
80 Professional Services	8.5%	24.4%	4.5%	9.0%	12.0%	19.0%	16.5%	5.8%	0.3%	100.0%
90 Project Contingency	2.0%	8.0%	11.0%	23.0%	19.0%	16.0%	18.0%	2.9%	0.1%	100.0%

Figure 2-2 and Table 2-5 provide a comparison of the alternatives with respect to costs incurred per year in YOE dollars. As shown in the table and figure, the major expenditures (80 percent) for the Build Alternatives are assumed to occur in years 4 through 7 of the nine year project implementation period, while the costs of the TSM Alternative are focused in year 7.

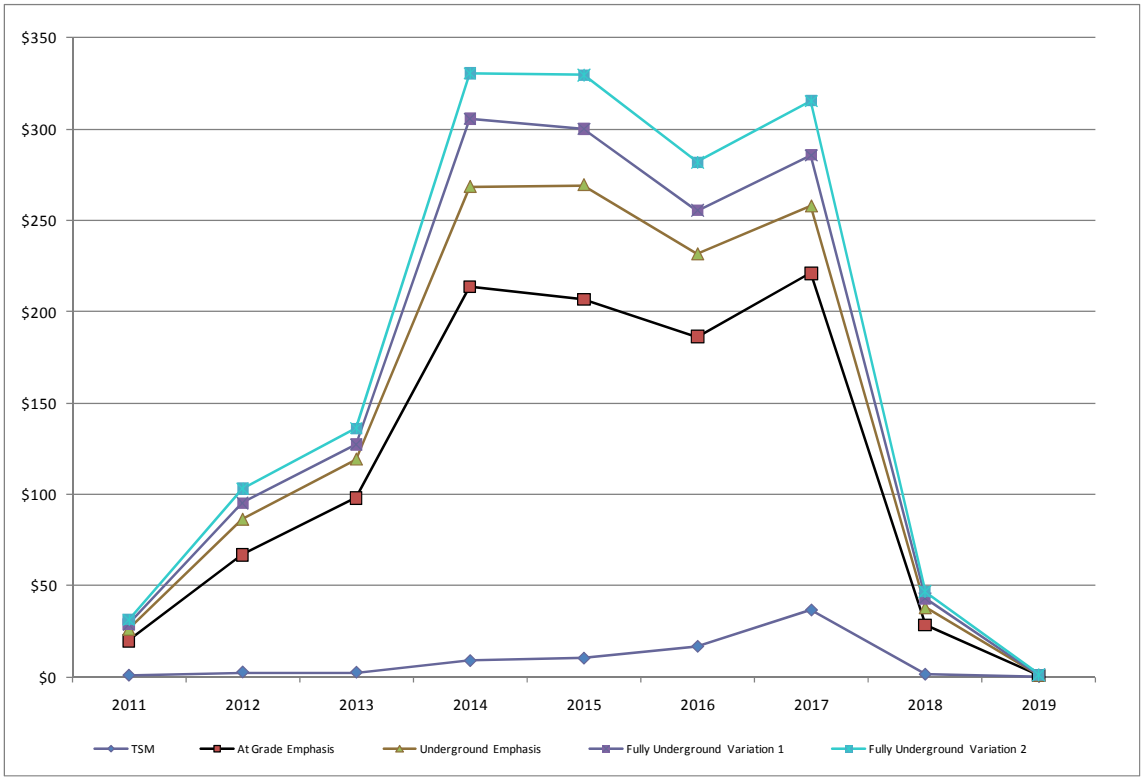

Figure 2-2: Annual Capital Costs by Alternative (YOE $ in Millions)

Table 2-5: Capital Costs by Alternative (YOE $ in Millions)

Fiscal Year	Implementation Year	TSM	Build LRT Alternatives			
			At Grade Emphasis	Underground Emphasis	Fully Underground - Little Tokyo Var 1	Fully Underground - Little Tokyo Var 2
2011	1	$0.8	$19.9	$26.1	$28.9	$31.4
2012	2	$2.6	$66.9	$86.3	$95.2	$103.2
2013	3	$2.5	$98.0	$119.2	$127.3	$136.2
2014	4	$8.9	$213.8	$268.2	$305.5	$330.4
2015	5	$10.2	$206.9	$269.2	$299.9	$329.5
2016	6	$16.8	$186.3	$231.4	$255.4	$281.7
2017	7	$36.9	$221.0	$257.6	$285.7	$315.4
2018	8	$1.4	$28.4	$37.9	$42.9	$46.7
2019	9	$0.0	$0.8	$1.0	$1.2	$1.3
Total		**$80.0**	**$1,042.2**	**$1,297.0**	**$1,442.0**	**$1,575.8**

2.2 Capital Revenue Sources

Metro's LRTP proposes the following combination of federal, State, and local revenue sources for the Regional Connector:

- Federal Sources:
  - FTA Section 5309 New Starts
  - Congestion Mitigation and Air Quality (CMAQ)
- State Sources:
  - California High Speed Rail Bonds
  - State Transportation Improvement Program (STIP)Regional Improvement Program (RIP) Funds

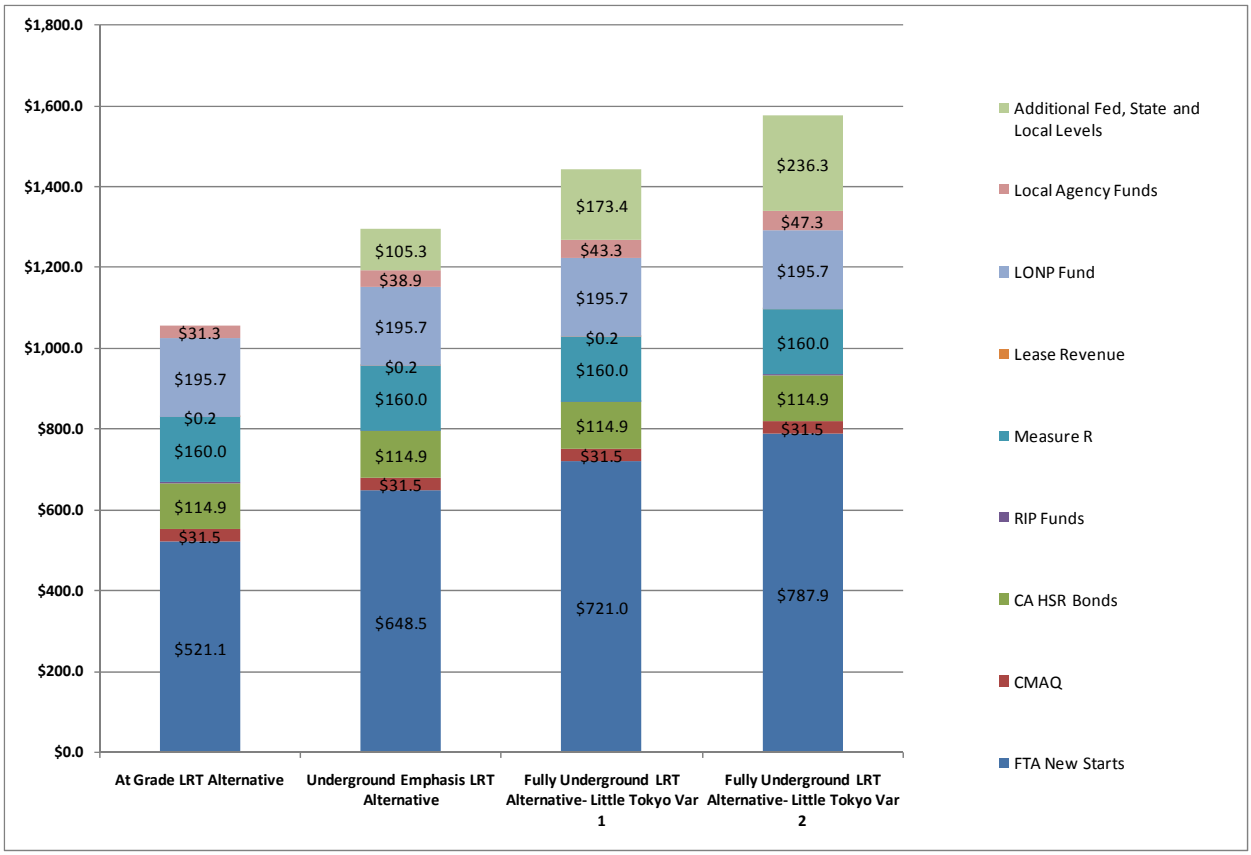
- Local Sources
  - Measure R Sales Tax
  - Lease Revenue
  - Letter of No Prejudice (LONP) Reimbursement Fund
  - Local Agency Funds
- Additional Local, State and Federal Funding Levels

Table 2-6 and Figure 2-3 summarize the composition of funding proposed from each source. In order of contribution, FTA Section 5309 New Starts funding is the largest source and is proposed to fund 50 percent of the cost of each alternative. LONP Reimbursement funds is the second largest source, followed by Measure R, High Speed Rail bond proceeds, Local Agency Funds, and CMAQ, with minor contributions from lease revenues and STIP RIP funds. As shown in the table and figure, additional revenues will need to be identified to fully fund the most recent capital cost estimates of the Build Alternatives. The required revenues range from $105.3 million for the At Grade Emphasis LRT Alternative to $236.3 million for the Fully Underground LRT Alternative – Little Tokyo Variation 2.

Table 2-6: Proposed Sources of Capital Funding (YOE $ in Millions)

Capital Revenue Sources	Build LRT Alternatives			
	At Grade Emphasis	Underground Emphasis	Fully Underground - Little Tokyo Var 1	Fully Underground - Little Tokyo Var 2
Federal				
Section 5309 - New Starts (50% of Costs)	$521.1	$648.5	$721.0	$787.9
CMAQ – Transit	$31.5	$31.5	$31.5	$31.5
State				
High Speed Rail Bonds	$114.9	$114.9	$114.9	$114.9
Regional Improvements Funds–Transit	$2.0	$2.0	$2.0	$2.0
Local				
Measure R Sales Tax ($160)	$160.0	$160.0	$160.0	$160.0
Lease Revenue	$0.2	$0.2	$0.2	$0.2
LONP Reimbursement Fund 3562	$195.7	$195.7	$195.7	$195.7
Local Agency Funds (3% of Costs)	$31.3	$38.9	$43.3	$47.3
Additional Federal, State, and Local Levels	$0.0	$105.3	$173.4	$236.3
Total Revenues	**$1,056.7**	**$1,297.0**	**$1,442.0**	**$1,575.8**
Total Cost	**$1,042.2**	**$1,297.0**	**$1,442.0**	**$1,575.8**

Note: With the exception of Section 5309, Local Agency Funds, and Additional Federal, State and Local Levels, all other sources match the funding amount included for the Regional Connector in Metro's LRTP.



Note: With the exception of Section 5309,Local Agency Funds, and Additional Federal, State and Local Levels, all other sources match the funding amount included for the Regional Connector in Metro's LRTP.

Figure 2-3: Proposed Sources of Capital Funding (YOE $ in Millions)

A brief description of each source is provided below.

2.2.1 Federal Funding Sources

FTA Section 5309 New Starts Program

The major funding source for the Build Alternatives is the FTA New Starts program. The New Starts program is the federal government's primary financial resource for supporting locally-planned, implemented, and operated transit fixed guideway capital investments, such as the Build Alternatives identified for the Regional Connector. Since the TSM Alternative does not include a fixed guideway element, it would not be eligible for New Starts funds.

Projects applying for New Starts funding must undergo evaluation by the FTA throughout the entire project development process. Projects are evaluated according to a variety of criteria

such as mobility improvements, environmental benefits, cost-effectiveness, operating efficiencies, transit supportive land use, and local financial capacity.

FTA's New Starts program is proposed to provide 50 percent of the funding for the Regional Connector. Table 2-7 summarizes the total and annual levels of New Starts funding proposed over the FY 2012 t0 FY 2018 period. As shown in the table, total New Starts funding ranges from approximately $521.1 million for the At-Grade Emphasis LRT Alternative to $787.9 million for the Fully Underground LRT Alternative – Little Tokyo Variation 2. Annual funding levels range from $24.3 million to $177.7 million.

Table 2-7: Projected Total and Annual New Starts Funding for the Regional Connector LRT Alternatives: FY 2012 to FY 2018 (YOE $ in Millions)

Fiscal Year	Build LRT Alternatives			
	At Grade Emphasis	Underground Emphasis	Fully Underground - Little Tokyo Var 1	Fully Underground - Little Tokyo Var 2
2012	$54.2	$67.5	$75.0	$82.0
2013	$53.4	$66.5	$73.9	$80.7
2014	$117.5	$146.2	$162.6	$177.7
2015	$107.8	$134.2	$149.2	$163.0
2016	$79.7	$99.2	$110.3	$120.5
2017	$84.2	$104.8	$116.5	$127.3
2018	$24.3	$30.2	$33.6	$36.7
Total	**$521.1**	**$648.5**	**$721.0**	**$787.9**

Congestion Mitigation and Air Quality Program (CMAQ)

The CMAQ program is a federal formula grant program for use on projects that contribute to attainment of national ambient air quality standards. Within the 2009 LRTP, Metro has programmed CMAQ funds as a source of capital funding for new rail and bus transit lines including Exposition Light Rail Line Phase I, Crenshaw Transit Corridor, Regional Connector,

rail system improvements, rail fleet procurement and for Metro Bus and Metro Rapid Bus projects. CMAQ is also programmed for rail and bus operations and can be used for the first three years of operation of individual new rail and bus projects.

The Regional Connector is programmed to receive $31.5 million in CMAQ funds. These funds are projected to be received over three years, with $28.9 million proposed in FY 2017, $2.6 million in FY 2018, and $0.1 million in FY 2019.

2.2.2 State Funding Sources

Safe, Reliable High Speed Rail Passenger Train Bond for the 21st Century (AB 3034):

As approved by California voters in November 2008, the high-speed rail bond allows for $9.95 billion of general obligation bonds to be issued for the California high speed rail project Of the $9.95 billion, $9.0 billion dollars is designated to provide a portion of the local share of funding for the first segment of the high speed rail network which is Los Angeles Union Station to San Francisco's Transbay Terminal.

The remaining $950.0 million has been designated for capital projects to connect existing passenger rail lines to the high-speed rail system as well as to enhance capacity and improve safety. The $950.0 million is proposed to be allocated to the following programs:

- Twenty percent ($190.0 million) will be allocated to the Department of Transportation for state supported intercity rail lines that provide regular service and operate and maintain their rail facilities, right of way and equipment with public funds. A minimum of 25 percent of the $190.0 million, approximately $47.5 million, will be allocated to California's three intercity rail corridors.
- Eighty percent ($760.0 million) will be allocated upon appropriation to eligible recipients according to the percent amount calculated of the following provisions:
    - One third of the eligible recipient's share of statewide track miles
    - One third of the eligible recipient's percentage share of statewide annual vehicle miles
    - One-third of the eligible recipient's percentage share of statewide annual passenger trips

Metro's LRTP assumes Metro will receive a total of $240.9 million in High Speed Rail Bond proceeds. Of this total, $114.9 million is proposed to be available for the Regional Connector, with $102.2 million in funding proposed in FY 2014 and $12.7 million in FY 2015. The remaining $126.0 million is proposed for improvements to the Metrolink commuter rail system.

Regional Improvement Program (RIP)

The State's funding for transportation is programmed in the State Transportation Improvement Program (STIP). Within the STIP, 75 percent of the funding is allocated and programmed by the regional transportation planning agencies such as Metro under the Regional Improvement Program (RIP). The remaining 25 percent is programmed by the State under the Interregional Improvement Program. The primary source of RIP funding is the federal Surface Transportation Program (STP).

Based on a fund estimate prepared by Caltrans, the California Transportation Commission develops the annual RIP programming targets for each agency. Metro selects and programs the projects to be funded through its Call for Projects process and the Metro Long and Short Range Transportation Plans. Metro has programmed and re-programmed its STIP projects to conform to the targets, which have been subject to change based on level of funds available and the extent of borrowing of transit revenues by the State for use in balancing the State Budget.

Metro's LRTP reflects expenditure of $2.0 million in RIP funding in FY 2008 for the Regional Connector.

2.2.3 Local Funding Sources

Measure R Sales Tax

The Regional Connector is programmed to receive $160.0 million in Measure R funds. These revenues are programmed over FY 2015 to FY 2017, with $95.9 million in FY 2015, $48.9 million in FY 2016, and $15.2 million in FY 2017.

Measure R is a 30-year ½-cent local sales tax approved by LA County voters is 2008 for rail expansion, local street improvements, traffic reduction, better public transportation, and quality of life. The tax went into effect on July 1, 2009. Metro is responsible for administering the funds. Funds flow to Metro which allocates to itself and other agencies according to the ordinance, Metro's Formula Allocation Procedure, and Metro Board actions. The voter-approved ordinance specifies the following apportionments:

- **35 Percent Transit Capital Specific Projects**: Allocated to Metro for new Rail and/or Bus Rapid Transit Capital Projects listed in the Ordinance. The Regional Connector is one of the named projects in the legislation and will receive $160 million from the Measure R sales tax.
- **20 Percent Highway Projects**: Capital project allocations per Metro Board action which can include construction of specific list of carpool lanes, highways, goods movement, grade separations, and soundwalls

- **20 Percent Bus Operations**: Allocated to Metro and non-Metro operators and agencies for bus operations. Suspends a scheduled July 1, 2009 Metro fare increase for one year and freeze all Metro Student, Senior, Disabled, and Medicare fares through June 30, 2013 by instead using Metro's Formula Allocation Procedure share of this subfund

- **15 Percent Local Return**: Distributed to the incorporated cities within Los Angeles County and to Los Angeles County for the unincorporated area of the County on a per capita basis to support major street resurfacing, rehabilitation and reconstruction; pothole repair; left turn signals; bikeways; pedestrian improvements; streetscapes; signal synchronization; and transit

- **5 Percent Rail Operations**: Provides funding for operation and maintenance of new transit projects

- **3 Percent Metrolink**: Allocated to the Southern California Regional Rail Authority (SCRRA) for capital improvements to the Metrolink commuter rail system. Funds may be used for Metrolink capital improvement projects within Los Angeles County as well as funding operations and maintenance costs.

- **2 Percent Rail Capital General Improvements**: Allocated to Metro for capital improvements to Metro's rail system including, system improvements, rail yards, and rail cars

- **Administration:** Metro may use 1.5 percent for program administration including planning, management, execution, use and conduct of the projects and programs funded by Measure R.

On March 25, 2010, the Metro Board approved the LRTP Near-Term Strategies, Priority Setting Criteria, and 2011 Los Angeles County Transportation Improvement Program. The purpose of this policy document is to define near-term strategies and priority-setting criteria for developing the FY 2011 Los Angeles County Transportation Improvement Program (TIP) and to address current and projected revenue shortfalls.

The Regional Connector Transit Corridor project has been included in the fourth priority category - projects seeking funds to begin or continue development phases. Based on the Board-approved criteria, projects in this category are the highest priority after: 1) projects currently under construction; 2) projects with construction bids advertised as of February 25, 2010; and 3) projects requiring right-of-way acquisition to continue with the project development process. Additionally projects in the fourth category are limited to those that are funded for construction completion in the first decade (through FY 2019) of the 2009 LRTP. The Regional Connector is included in this category to complete the environmental clearance phase of project development.

The Regional Connector is also included in the fifth priority category which reflects criteria for selecting projects to advance to construction. The top criterion in this category is Safety and New Starts. Under this criterion, rail safety projects are recommended as a first priority followed closely by New Starts projects that demonstrate high likelihood of successfully competing for discretionary federal funds.

Lease Revenue

Metro receives approximately $12.0 million annually in revenue from leases of property and assets. Lease revenues are assumed to be available to fund administration, rail and bus capital, and bus operations. Metro's LRTP reflects $0.2 million in lease revenue expended on the Regional Connector in FY 2007.

LONP Reimbursement Fund

The FY 2010 Metro budget includes a "Special Revenue Other" fund balance of $297.0 million in AB 3090 and Traffic Congestion Relief Program (TCRP) LONP reimbursements from the State of California. These capital reimbursements are for advances made by Metro to the State in lieu of capital project funding that could not be provided by the State on the originally programmed schedule. In the LRTP Metro assumed that these funds must be used for capital purposes only. As they are reimbursements for prior capital expenses, the funds are flexible for many transportation capital purposes, including subway uses now prohibited by Proposition A and Proposition C.

The LRTP takes advantage of the flexibility by assuming the use of the funds, in part, for leveraging federal New Starts funds for planned subway construction projects, including the Regional Connector.

Metro's LRTP assumes $195.7 million in LONP Reimbursement Fund revenue will be available for the Regional Connector. These funds are programmed for receipt over FY 2009 through FY 2019.

Local Agency Funds

To assist in funding the Measure R program of projects, Metro has proposed for consideration that local jurisdictions provide a three percent local match for projects. Metro is working with cities, the County of Los Angeles, the Technical Advisory Committee, and subregional entities on an appropriate policy to support this. Issues currently being addressed include timing, clarification as to what constitutes a local match, definition of how to determine proportional share, and discussion of whether the three percent match changes if there is an increase or decrease in total project cost.

Metro's LRTP assumes 3 percent of total project costs of the Regional Connector will be provided from Local Agency Funds. This would result in $31.3 to $47.3 million for the Regional Connector depending on the Build Alternative recommended.

2.2.4 Refined Local, State, and Federal Funding Levels

Based on a comparison of the sources and funding levels for the Regional Connector identified in the LRTP compared to the updated capital cost estimates in the environmental document, the Underground Emphasis LRT Alternative and the Fully Underground LRT Alternative – Little Tokyo Variations 1 and 2 would require additional funding ranging from $105.3 million to $236.4 million. Prior to selection of the LPA for the Regional Connector, Metro staff will refine the long range financial plan to reflect the prioritization criteria adopted by the Board on March 25, 2010 as well as other policy actions associated with accelerating the Measure R program. It is anticipated that the results of this refinement will identify local, State and federal revenue levels to fully fund the Regional Connector as well as other LRTP projects identified as priorities for construction. Supplementary funding could potentially be secured from use of Proposition C 25% funds for eligible project elements, additional LONP Reimbursement Funds, STIP RIP funds, CMAQ, and other sources to be defined.

3.0 OPERATING AND MAINTENANCE COSTS AND REVENUES

This section describes the O&M costs of the alternatives and the revenue sources proposed to fund them.

3.1 O&M Costs

System-wide O&M cost estimates were developed for the heavy rail, light rail, and bus components of the alternatives and reflect operating plans for the year 2035. The resource build-up methodology for estimating O&M costs was designed to satisfy FTA guidance. Detailed information regarding O&M costs is provided in the *Regional Connector Transit Corridor: Operating and Maintenance Cost Estimate Report* dated January 26, 2010

For this report, O&M costs are shown in 2009 dollars. In the next iteration of the financial analysis, O&M costs will be shown in YOE dollars and will be included in a detailed cash flow analysis reflecting costs and revenues from opening year to the horizon year of FY 2035.

Table 3-1 summarizes Metro's FY 2035 heavy rail, light rail, and bus O&M cost by mode for each alternative. As shown in the table, total FY 2035 O&M cost for these modes in the Build Alternatives ranges from $1,634.8 million for the Underground Emphasis LRT Alternative to $1,644.0 million for the TSM Alternative. Table 3-2 compares the change in annual O&M costs relative to the No Build Alternative, while Table 3-3 compares the change in O&M costs relative to the TSM Alternative. Key findings from these comparisons are summarized below.

- In comparison to the No Build Alternative:
    - All of the alternatives increase O&M costs relative to the No Build Alternative. The Underground Emphasis LRT Alternative has the lowest annual increase in O&M cost ($5.1 million), followed by the Fully Underground LRT Alternatives ($6.1 million for both variations) and At-Grade Emphasis LRT Alternative ($11.9 millions). The TSM Alternative has the largest increase in annual O&M costs ($14.3 million) due to the significant increase in bus service and relatively small savings in heavy rail and light rail costs (approximately $0.2 million).
- In comparison to the TSM Alternative:
    - All of the Build Alternatives reduce O&M costs relative to the TSM Alternative. The Underground Emphasis LRT Alternative provides the largest annual savings (approximately $9.2 million in savings), followed by the Fully Underground LRT Alternatives (approximately $8.2 million in savings for both variations) and the At-Grade Emphasis LRT Alternative (approximately $2.4 million in savings).

Table 3-1: FY 2035 Heavy Rail, Light Rail, and Bus O&M Costs by Alternative (2009 $ in Millions)

Mode	No Build	TSM	Build LRT Alternatives			
			At - Grade Emphasis	Underground Emphasis	Fully Underground – Little Tokyo: Var 1	Fully Underground – Little Tokyo: Var 2

3.2 O&M Revenue Sources

The sections below describe the estimated fare revenue, farebox recovery rates, and levels of annual system-wide operating support associated with the alternatives.

3.2.1 Farebox Revenues and Farebox Recovery

Table 11 summarizes the annual system-wide farebox revenues and farebox recovery rates for the heavy rail, light rail, and bus components of the alternatives for the FY 2035 horizon year. To compare the differences among alternatives, annual estimates of FY 2035 farebox revenues were developed based on the travel forecasting model projections of 2035 total daily boardings and linked trips by alternative and an average fare revenue per linked trip calculation, which is described in detail below. Total daily linked trips were annualized using an annualization factor of 317.80, consistent with the factor used in calculation of user benefits. The resulting annual revenue realized from system-wide linked trips are shown in the table below.

The following process was used to develop total fare revenue for each alternative:

- Three sources of data were used by Metro to derive the average fare paid for heavy rail, light rail, and bus linked trips with multiple boardings. These sources are:
  - Metro's 2002 On-Board survey, which provided data on the distribution of linked trips by number of boardings and by fare instrument used
  - Service Performance Branch data for 2002 on the number of boardings by fare instrument used
  - Records of the units sold in 2002 of each fare instrument (cash, weekly pass, monthly pass, elderly and disabled discounts, etc)
- Using these three sources in combination, Metro staff calculated the average fare paid for each segment of a linked trip with multiple boardings. The analysis indicated that the average fare for the first boarding was approximately $1.07, and the incremental fare for additional boardings was approximately $0.22.
- In order to incorporate these results into Metro travel demand model, the values were deflated to 1999 dollars. Based on the LA region's consumer price index (CPI) over the 1999 to 2002 period, the values were deflated by 0.91 which resulted in the first boarding average fare equivalent to approximately $0.98 and the incremental fare for additional boardings equivalent to approximately $0.20. These are equivalent to the values used in the travel demand model runs for the Regional Connector.
- Based on the results of the Regional Connector travel demand model runs, total heavy rail, light rail, and bus boardings and total linked trips were calculated for each alternative.
- Fare revenues for each alternative were developed using a two step process. First, total linked trips were multiplied by the 1999 first boarding fare equivalent ($0.98). Second, to account for linked trips that required multiple boarding, the incremental fare for additional boardings ($0.20) was multiplied by the number of additional boardings (total boardings minus total linked trips) for each alternative.
- Finally the total fare revenue for each alternative was inflated to 2009 dollars using an inflation factor of 1.34 which represents the change in CPI over the 1999 to 2009 period. The resulting fare in 2009 dollars is equivalent to approximately $1.31 for the initial boarding and $0.26 for each additional boarding.

Table 3-4 provides the summary results of the fare revenue analysis process. As shown in the table, annual system-wide farebox revenues for the 2035 horizon year are projected to range from $566.4 million for the No Build Alternative to $572.4 million for the Fully Underground

Little Tokyo LRT Alternative - Variation 1. With the exception of the At-Grade Emphasis LRT Alternative, the Build LRT Alternatives are projected to generate higher annual fare revenues relative to the TSM Alternative. The Underground Emphasis LRT Alternative is projected to increase annual fare revenues by $0.6 million and the Fully Underground LRT Alternatives are projected to increase annual fare revenues by $1.3 million and $1.4 million respectively.

Relative to the annual system-wide O&M costs projected for the 2035 horizon year shown previously in Table 3-4, farebox recovery is estimated to range from 34.7 percent for the TSM Alternative to approximately 35.0 percent for the Underground Emphasis LRT Alternative and both variations of the Fully Underground LRT Alternative.

Table 3-4: FY 2035 Annual Fare Revenues and Farebox Recovery by Alternative (2009 $ in Millions)

Alternative	No Build	TSM	Build LRT Alternatives			
			At-Grade Emphasis	Underground Emphasis	Fully Underground - Little Tokyo Var 1	Fully Underground Little Tokyo Var 2
Annual Boardings (millions)	694.0	704.9	691.0	692.1	693.0	693.1
Annual Linked Trips (millions)	364.9	366.6	369.6	370.4	370.8	370.9
Fare Revenue	$566.5	$571.1	$570.6	$571.8	$572.4	$572.5
Farebox Recovery	34.8%	34.7%	34.8%	35.0%	35.0%	35.0%

3.2.2 Level of Operating Support from Metro

The combined effect of lower annual system-wide O&M costs and higher farebox revenues is projected to reduce the level of annual operating support that Metro would be required to fund. Table 3-5 summarizes the reduction in annual operating support associated with the Build Alternatives relative to the TSM Alternative. As shown in the table, the Underground Emphasis LRT Alternative is projected to reduce the level of annual system-wide operating support required from Metro by $9.8 million while variations 1 and 2 of the Fully Underground LRT Alternative are projected to reduce Metro's annual system-wide operating subsidy by $9.5 million and $9.6 million respectively. The At Grade Emphasis LRT Alternative is projected to result in a lesser reduction in Metro's annual system-wide operating subsidy, or $1.9 million.

Table 3-5: FY 2035 Reduction in Annual Operating Support Relative to the TSM Alternative (2009 $, Millions)					
	TSM	Build LRT Alternatives			
		At Grade Emphasis	Underground Emphasis	Fully Underground-Little Tokyo Var 1	Fully Underground-Little Tokyo Var 2
Increase in Farebox Revenues	-	-$0.5	$0.6	$1.3	$1.4
O&M Cost Savings	-	$2.4	$9.2	$8.2	$8.2
Reduction in Operating Support	**-**	**$1.9**	**$9.8**	**$9.5**	**$9.6**

3.2.3 Sources of O&M Funding Sources

The Regional Connector will be funded as an incremental component of Metro's existing and planned rail program. In addition to fare revenue, the following summarizes the local, State and federal revenue sources that are projected to provide approximately $8.1 billion in operating support for the Metro rail system based on the LRTP Financial Plan. Table 3-6 summarizes the level of funding each source is projected to provide for Metro rail operations over the FY 2019 to FY 2035 period.

Table 3-6: Funding Support for Rail Operations, by Source FY 2019 – FY 2035 (YOE $ in Millions)	
Source	**Total, FY 2019-2035**
Local Funds	
Proposition A Rail Development Program	$1,834.3
Proposition C Security Program	$316.6
Proposition C Discretionary Program	$1,326.9
Measure R Rail Operations Program	$1,158.3
Transportation Development Act	$1,213.0
Other Metro Funds	$37.7
State Funds	
State Transportation Assistance	$1,060.6
Federal Funds	
Section 5309 Fixed Guideway Modernization Program	$778.5
Section 5340 Growing States and High Density Program	$138.9
CMAQ	$276.1
TOTAL	**$8,140.9**

3.2.3.1 Local Funds

- **Proposition A Rail Development Program Funds:** Proposition A is a county-wide half-cent sales tax that was passed in 1980. This voter-approved sales tax is used to improve and expand public transportation throughout Los Angeles County. Proposition A funds are allocated among four funding programs: Local Return Program (25 percent), Rail Development Program (35 percent), Discretionary Program (40 percent), and the 5 percent of 40 percent Incentive Program.

  Rail Development Program funds can be used for a variety of construction and operation purposes. For previous major construction projects, such as the Blue,

Green and Red Lines, Metro has leveraged these funds by bonding in accordance with the agency's adopted debt policy. Bond debt service has the first claim of funds from this program. Other eligible uses include the acquisition, renovation, rehabilitation, and replacement of rail vehicles, rail facilities, and wayside systems; operation of rail systems, and acquisition and maintenance of rights of way.

2019-2035 Funding Projection: $1,834.3 million

- **Proposition C Security and Discretionary Programs**: Proposition C is a county-wide half-cent sales tax that was passed in 1990. This voter-approved sales tax is used for public transit purposes throughout Los Angeles County. Proposition C funds are allocated among five funding programs: Rail and Bus Security (5 percent), Commuter Rail/Transit Centers (10 percent), Local Returns (20 percent), Transit-related Improvements to Freeways and State Highways and Public Mass Transit Improvements to Railroad Rights-of-Way (25 percent) and Discretionary program (40 percent).

  Security funds improve and expand rail and bus security services such as new rail line security, transit service and facilities security, security incentives, security improvements, and demonstration projects.

  2019-2035 Funding Projection: $316.6 million

  Discretionary Program funds are currently allocated at the discretion of Metro Board to Metro and non-Metro operators and agencies after all other funding opportunities are exhausted.

  2019-2035 Funding Projection: $1,326.9 million

- **Measure R Rail Operations Program:** As stated earlier, 5 percent of Measure R sales tax revenue is to be used to support operating costs of new rail projects.

  2019-2035 Funding Projection: $1,158.3 million

- **Transportation Development Act (TDA) Funding**: Each California County receives funding from the Local Transportation Fund (LTF) which is derived from a ¼ cent of the 7.25 cent statewide retail sales tax. The funds are apportioned by the State Board of Equalization according to the amount of tax collected within the each county.

  2019-2035 Funding Projection: $1,213.0 million

- **Other Metro Funds**: This category reflects fees collected by Metro for advertising, chartering, leasing, ridesharing, and other miscellaneous services.

  2019-2035 Funding Projection: $37.7 million

3.2.3.2 State Funds

- **State Transportation Assistance (STA)**: Through FY 2008, funding was provided through 50 percent of the Public Transportation Account (PTA) revenue. Funds were apportioned to counties based 50 percent on population share and 50 percent to operator revenue share (the ratio of each transit operator's revenues to the revenues of operators in the State) In 2007, Senate Bill 717 (SB 717) changed the allocation of the PTA program beginning in FY 2009. Under SB 717, STA has been funded from 75 percent of the PTA revenue and is apportioned 50 percent based on population share and 50 percent based on operator revenue share. Applicants for funds must meet one of the following eligibility tests:

  - Latest audited operating cost per revenue vehicle hour does not exceed the sum of the preceding year's operating cost per revenue vehicle hour and an amount equal to the product of the percentage change in CPI for the same period multiplied by the preceding year's operating cost per revenue vehicle hour.

  - Latest audited 3-year average operating cost per revenue vehicle hour does not exceed the sum of the average of the operating cost per revenue vehicle hour in the 3 years preceding the latest audited year and an amount equal to the product of the average percentage change in CPI for the same period multiplied by the average operating cost per revenue vehicle hour in the same 3 years.

  Metro's policy has been to allocate the population share of STA funds for rail operations, which is also reflected in the long range financial plan. It should be noted that legislation passed in 2010 to eliminate the sales tax on motor fuels will change the level of funding in the STA by eliminating the PTA.

  2019-2035 Funding Projection: $1,060.6 million

3.2.3.3 Federal Funds

- **Section 5309 Fixed Guideway Modernization Funds:** A federal formula program that is allocated to urbanized areas with populations greater than 200,000 with fixed guideway systems that have been in operation for at least seven years. These funds can be used for preventive maintenance activities incorporated into the operating plan. These activities can include preservation of fixed guideway infrastructure such as maintenance of vehicles, buildings, equipment, electric power facilities, vehicle movement control systems, fare collection and counting equipment, structures, tunnels, subways, and roadways.

  2019-2035 Funding Projection: $778.5 million

- **Section 5340 Growing States and High Density Program:** Funds from this program are allocated based on two categories. First, 50 percent of funds are made available under the Growing States factors and are apportioned based on State population

forecasts for 15 years beyond the most recent census. Amounts apportioned for each State are then allocated to urbanized and rural areas based on the State's urban/rural population ratio. Second, the remaining 50 percent is allocate based on the High Density States factor which distributes funds to States with population densities greater than 370 people per square mile and are apportioned only to urbanized areas within those States. The State of California does not qualify for High Density funds since its population density is 217 people per square mile. Metro uses the Growing States funds for rail operations.

2019-2035 Funding Projection: $138.9 million

- **CMAQ:** In addition to the capital use of CMAQ funds as described earlier, these funds can also be used for operating costs.

  2019-2035 Funding Projection: $176.1 million

4.0 RISKS AND UNCERTAINTIES

This report has summarized the proposed costs and revenues that would provide Metro sufficient funding to support the construction, operation and maintenance of the Regional Connector and at the same time allow for operation, maintenance, and expansion of the existing transit system.

The implementation of the LPA selected for the Regional Connector is proposed to receive 50 percent federal participation through the FTA New Starts program. The magnitude of this investment demands that Metro have complete assurance that at the time of construction, federal funding will follow the distribution schedule detail in a New Starts Full Funding Grant Agreement (FFGA). Conversely, the FTA must have assurance that limited federal funds will be fully and productively utilized and leveraged to the greatest extent possible. If the Regional Connector LPA is carried forward, these mutual assurances will be negotiated and described in an FFGA between FTA and Metro, which would occur during the project's final design stage.

4.1 Key Risks and Uncertainties

Although Metro has proposed a most likely scenario based on the funding and cost assumptions presented above, there are a number of capital and operating risks and uncertainties that could influence the financial plan in future phases of project development. The following sections discuss risks and uncertainties related to:

- Availability of Federal Funds
- Revenue Risk
- Construction Cost Risk
- Operating Risk

Strategies to address risk are also described.

4.1.1 Availability of Federal Funds

- The guaranteed transit funding levels that were included in SAFETEA-LU provided greater certainty about the annual flow of federal transit monies. However FTA funds are appropriated on a yearly basis. As result, annually there continued to be a level of uncertainty regarding the amount and timing of the discretionary and formula funds that would be available to transit agencies.
- Although SAFETEA-LU was to expire in 2009, the next surface transportation authorization legislation has not been approved and SAFETEA-LU has been extended until December 31, 2010. At this time there is considerable uncertainty regarding

when Congress will pass new transportation authorization legislation, if the annual appropriation process will remain unchanged, and the level of funding that will be provided for the New Starts program.

4.1.2 Revenue Risk

- Capital Funding Availability - The availability of capital funds from various sources (e.g., federal level and match of Section 5309 and Section 5307, and local sources) affects the timing and overall cost of the project. Insufficient annual allocations require an extension of the construction schedule so that costs do not exceed available resources.

- Tax Revenues: Variations in tax revenues affect the availability of resources to fund capital and operating needs.

4.1.3 Construction Cost Risk

- Construction Costs: The Regional Connector requires underground construction through a densely developed area. Differences in construction costs may occur because of: (1) unforeseen conditions not evaluated at the current conceptual level of engineering, such as soil conditions or utility relocation; (2) variations in construction unit costs, bid quantities and other contingencies; and (3) changes in design elements.

- Real Growth: The rate of real growth (i.e., the difference between the rate of inflation for a specific commodity or service and the baseline rate of inflation, as measured by the local Consumer Price Index or Construction Cost Index), may vary. These variations in the real rate of cost growth are particularly important for certain commodities or services which constitute a significant element of the capital and O&M cost structure of the transit system (e.g., labor, electricity, fuel, parts and construction).

- Schedule: A number of issues could result in construction delay including but not limited to unforeseen construction challenges or the local decision-making process. At this early stage in the project development process, the exact timing of the construction phases is not finalized. This uncertainty could impact the availability and timing of local and federal funds. However, both of Metro's federal rail projects, Red Line and Eastside Gold Line, were delivered on the FFGA schedule and budget.

4.1.4 Operating Risk

- Fares, Fare Policy and Cost Recovery: Changes in fare level and structure affect ridership, fare revenue and cost recovery. Changes in ridership affect the level of service required which, in turn, affects capital and operating costs and revenue.

- Service Levels: The frequency of service and hours of operation affect ridership, fare revenue and capital and operating costs.

4.2 Strategies to Address Risk

As the Regional Connector Transit Corridor project is implemented, there are several strategies that Metro could utilize to address risks, if one or more should occur. These strategies include: redefining project schedules; short term financing strategies such as grant anticipation notes and revenue anticipation notes or federal loans which can be used to close gaps between needed and available revenues. These types of strategies will be considered in subsequent iterations of the financial plan.

In addition, Metro, with support from the City of Los Angeles and a coalition of local civic leaders and organizations, is seeking to accelerate delivery of the Measure R program through public-private partnerships and a "30/10" initiative. This initiative calls for Metro to leverage Measure R sales tax through an innovative program involving advanced federal infrastructure funding and federally-back debt.

5.0 SUMMARY OF KEY FINDINGS

The key findings of the financial analysis are summarized below.

- Regional Connector Priority in Policy and Planning Documents:
  - The Regional Connector is included in both of the existing long range financial planning documents for the region: LA Metro's *2009 LRTP* and the Southern California Association of Governments *2008 Regional Transportation Plan*. Within the LRTP, the Regional Connector is identified as one of the priority transit corridor projects to be funded and implemented by 2019. With regard to the SCAG's RTP, the Regional Connector is included in the financially constrained plan as a funded project (project identification number 1TR0404).
  - Based on the adopted March 25, 2010 Board policy, the Regional Connector has been prioritized for funding in the first category of projects after construction and right-of-way related activities to complete environmental clearance. Additionally, the Regional Connector is included in the highest priority category to fund the next set of long range projects that will be constructed.
- Capital Costs
  - The capital costs of the TSM Alternative and three Regional Connector Build Alternatives in 2009 dollars range from $67.3 million for the TSM Alternative to $1.36 billion for the Fully Underground LRT Alternative Little Tokyo Variation 2. Capital costs by alternative are summarized below. These costs reflect a nine year implementation schedule, which is consistent with planning estimates in the LRTP. In future iterations of the financial analysis, the costs and implementation schedule will be refined.
    - TSM Alternative: $67.3 million ($80.0 million YOE dollars);
    - At-Grade Emphasis LRT Alternative: $899.2 million ($1,042.2 million YOE dollars);
    - Underground Emphasis LRT Alternative: $1,120.1 million ($1,297.0 million YOE dollars);
    - Fully Underground LRT Alternative - Little Tokyo Variation 1: $1,245.2 million ($1,442.0 million YOE dollars); and
    - Fully Underground LRT Alternative - Little Tokyo Variation 2: $1,360.2 million ($1,595.8 million YOE dollars).

- Capital Revenue Sources
  - The capital costs of the Build Alternatives are proposed to be funded from the sources listed below. Prior to submittal of an application for FTA authorization to advance to the next stage of New Starts project development, Metro will refine the proposed funding plan to reflect Board policies related to LRTP prioritization and anticipated changes in projected revenue levels and financing opportunities.
    - Federal:
      - FTA Section 5309 New Starts: 50 percent of capital costs.
      - Congestion Mitigation and Air Quality (CMAQ): $31.5 million.
    - Local/State:
      - California High Speed Rail Bonds: $114.9 million.
      - Region Improvement Plan: $2.0 million.
      - Measure R Sales Tax: $160.0 million.
      - Lease Revenue: $0.20 million.
      - Letter of No Prejudice Reimbursement: $195.7 million.
      - Local Agency Funds: 3 percent of capital costs.
- Additional Capital Funding Sources to be Defined:
  - Additional local, State, and federal revenues are needed to fund the Underground Emphasis LRT Alternative and the Fully Underground LRT Alternative – Little Tokyo Variations 1 and 2. These alternatives require identification of sources for unfunded balances of $105.3 million, $173.4 million, and $236.4 million respectively.
  - Prior to selection of the LPA for the Regional Connector, Metro staff will refine the long range financial plan to reflect the prioritization criteria adopted by the Board on March 25, 2010 as well as other policy actions associated with accelerating the Measure R program. It is anticipated that the results of this refinement will identify local, State and federal revenue levels to fully fund the Regional Connector as well as other LRTP projects identified as priorities for construction. Supplementary funding could potentially be secured from use of Proposition C 25% funds for eligible project elements, additional LONP Reimbursement Funds, STIP RIP funds, CMAQ, and other sources to be defined.

- Level of FTA New Starts Funding Proposed:
  - The FTA New Starts program is proposed to fund 50 percent of the cost of each Build LRT Alternative. The range of FTA New Starts funding proposed ranges from $521.1 million for the At-Grade Emphasis LRT Alternative to $787.9 million for the Fully Underground LRT Alternative - Little Tokyo Variation 2. These funds are proposed to be provided over the FY 2012 to FY 2018 period.
- O&M Cost Savings Relative to the TSM Alternative:
  - All of the Build Alternatives are projected to reduce O&M costs relative to the TSM Alternative. The Underground Emphasis LRT Alternative provides the largest annual savings (approximately $9.2 million in savings), followed by the Fully Underground LRT Alternatives (approximately $8.2 million in savings for both variations) and the At-Grade Emphasis LRT Alternative (approximately $2.4 million in savings).
- Higher Farebox Revenues Relative to the TSM Alternative:
  - With the exception of the At-Grade Emphasis LRT Alternative, the Build LRT Alternatives are projected to generate higher annual fare revenues relative to the TSM Alternative. The Underground Emphasis LRT Alternative is projected to increase annual fare revenues by $0.6 million and both variations of the Fully Underground LRT Alternatives are projected to increase annual fare revenues by $0.6 million. The At-Grade Emphasis LRT Alternative is projected to reduce annual farebox revenues by $0.5 million.
- Reduction in Metro Funding Support Required for Rail Operations Relative to the TSM Alternative:
  - The combined effect of lower annual system-wide O&M costs and higher farebox revenues for the Underground Emphasis and Fully Underground LRT Build Alternatives is projected to reduce the level of annual operating support that Metro would be required to fund relative to the TSM Alternative.
  - The Underground Emphasis LRT Alternative is projected to reduce the level of annual system-wide operating support required from Metro by $9.8 million while variations 1 and 2 of the Fully Underground LRT Alternative are projected to reduce Metro's annual system-wide operating subsidy by $9.5 million and $9.6 million respectively. The At Grade Emphasis LRT Alternative is projected to result in a lesser reduction in Metro's annual system-wide operating subsidy, or $1.9 million.

- Key Risks and Uncertainties:
  - As the Regional Connector Transit Corridor project advances to subsequent stages of project development, strategies will be identified to address key risks and uncertainties related to:
    - Availability of Federal Funds
    - Revenue Risk
    - Construction Cost Risk
    - Operating Risk
- Future Actions:
  - Metro, with support from the City of Los Angeles and a coalition of local civic leaders and organizations, is seeking to accelerate delivery of the Measure R program through public-private partnerships and a "30/10" initiative. This initiative calls for Metro to leverage Measure R sales tax through an innovative program involving advanced federal infrastructure funding and federally-back debt.
  - As the alternatives selection process moves forward, future iterations of the financial analysis will be conducted, with increasing levels of detail and refinement. The refined financial analysis will identify revenue sources for the unfunded balances of the Build LRT Alternatives. In addition, detailed cash flow analyses will be conducted to document Metro's financial capacity to implement the Regional Connector and to maintain, operate, and expand the overall transit network through the project horizon year of 2035.

Regional Connector Transit Corridor
Draft Environmental Impact Statement/ Draft Environmental Impact Report

APPENDIX I

AGENCY COORDINATION AND PUBLIC INVOLVEMENT
Collateral Materials

State Clearinghouse Number: 2009031043

Regional Connector Transit Corridor

Overview | Benefits | The Process

The Metropolitan Transportation Authority (Metro) is conducting an environmental review of the Regional Connector Transit Corridor, a project that, if built, creates an almost 2-mile transit link between the Metro Gold and Metro Blue Line light rail transit (LRT) systems through downtown Los Angeles.

This Regional Connector will connect the Metro Gold Line Eastside Extension and the Metro Expo Line, which is currently under construction and will link Downtown to Culver City with other potential new light rail transit projects.

By providing continuous through service between these lines, the Regional Connector will improve access to both local and regional destinations – and help create a true transportation network for the region. The Regional Connector is slated to receive partial funding from Measure R, the half-cent sales tax increase approved by voters in November 2008.

Last Revised: Tuesday April 13, 2010 11:09:01 AM

Frequently Asked Questions

GENERAL BACKGROUND

What is the Regional Connector Transit Corridor Study? How did it come about?

Metro will analyze options for connecting the Metro Gold, Blue, and Expo Lines through downtown Los Angeles from 7th Street/Metro Center to Alameda Street between 1st and Commercial Streets. By more directly linking these existing rail lines, Metro aims to increase mobility, accessibility and ridership throughout the region.

The Regional Connector Transit Corridor project was originally part of the planning of the Metro Gold Line but was deferred due to funding considerations. The Regional Connector was subsequently recommended for further study in both Metro's 1992 Long Range Transportation Plan and 2003 Short Range Transportation Plan. A 2004 feasibility study found that connecting these key light rail transit lines would significantly increase utilization of all rail lines and improve mobility throughout the region.

What area is Metro studying as part of the Regional Connector?

The study corridor extends from the Metro Blue Line terminus at 7th Street and Wilshire Boulevard to the vicinity of the Metro Gold Line Eastside station at 1st and Alameda streets in downtown Los Angeles. The study area encompasses approximately two square miles and includes the communities of Little Tokyo, the Arts District, Historic Core, Toy District, Bunker Hill, Financial District, Jewelry District, and Civic Center.

What transit modes are being considered?

The transit modes under consideration for the Alternatives Analysis include existing modes in operation by Metro, including light rail (Blue/Green/Gold Lines), and different bus modes (Bus Rapid Transit or "BRT," Metro Rapid Bus, etc.).

ROUTES/ALIGNMENTS

What does Metro consider to be alternatives?

Alternatives will be developed by:

- Mode of transit – Potential modes include light rail, or bus rapid transit,,
- Alignment – The route to be taken to connect the Metro Gold Line Little Tokyo Station to the 7th Street/Metro Center station.
- Configuration – Whether the segments of the route will be at street level, aerial or underground
- Station location – Where stations would be located.

Regional Connector Transit Corridor Study

Frequently Asked Questions

What factors will Metro use to select a project?
Factors or criteria used to evaluate alternatives will be consistent with the Federal New Starts Funding guidelines, Metro guidelines, and the input received from the public during the early scoping period. Typical evaluation criteria include improvements to air quality and the environment, increases in transit ridership, improvements to travel time, project cost, and ability to generate economic activity.

Where will new stations be located?
Public input will help Metro determine potential station locations. Locations are usually determined by factors such as the ability of the station to serve a greater number of riders, whether a station supports the community's vision, and how the station might contribute to local economic vitality.

Will the Regional Connector consider all the new residential development downtown when evaluating station locations?
The Regional Connector's performance is based on 2030 forecasts for regional growth. This takes into consideration not only the communities now developing around the extensive rail and bus system throughout the region, but also the ongoing revitalization of downtown Los Angeles.

RELATIONSHIP WITH TRANSIT

How will the Regional Connector coordinate with DASH and other frequently used bus corridors like Broadway and Spring Streets?
The Regional Connector will be part of an integrated transportation system that includes pedestrian and bike amenities, regional rail, and various bus systems. As part of the AA, the ability of an alternative to best integrate and optimize transit usage, including services on local streets, will be determined.

Will this project consider closing any major arterial streets to automobile traffic?
Should an alternative require elimination of parking or a traffic lane, the associated impacts will be discussed with the community and other stakeholders, and ways to mitigate those impacts will be developed in collaboration with the public. The alternatives will be evaluated based on criteria established from input received from the public during early scoping, criteria from the Federal New Starts Funding guidelines, and Metro guidelines.

Regional Connector Transit Corridor Study

Frequently Asked Questions

SAFETY

If a subway mode is selected, how can I be sure that tunnels will be safe during an earthquake?
Similar to existing Red and Purple Line tunnels, engineers use the most recent seismological data along with subsurface ground conditions to design reinforcing for the tunnels and station structures. During the Northridge Earthquake, tunnels performed exactly as predicted. No damage to Metro structures was observed.

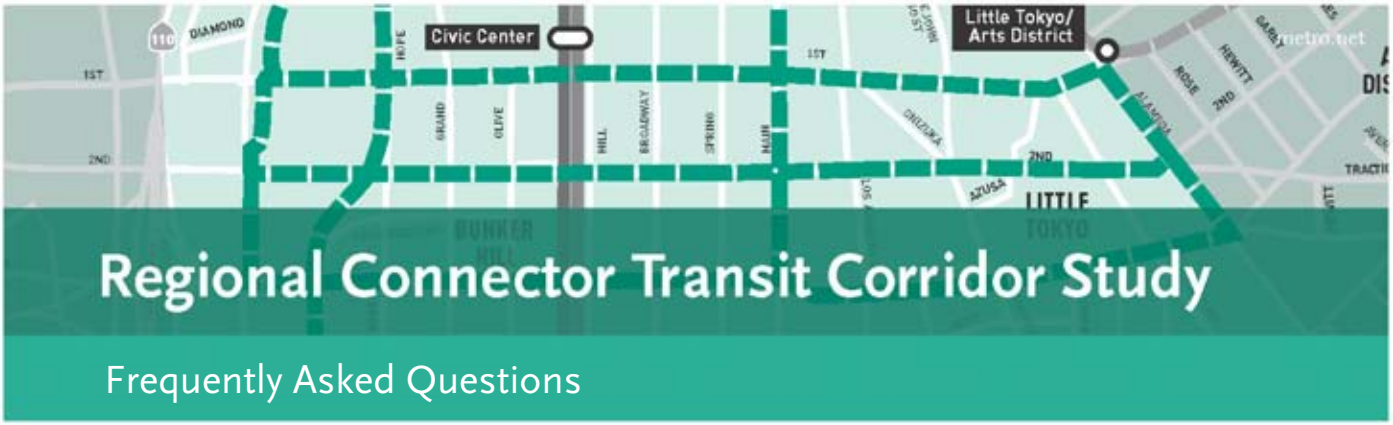
How will pedestrian safety be addressed if at-grade crossings are anticipated?
Any safety program would include education, engineering, and enforcement. Metro has implemented a Rail Safety Education Program to address auto and pedestrian safety. This program offers rail safety orientation and training, particularly to schools and other community groups within a 1.5-mile radius of a Metro fixed-route transit system.
During the project development process, various agencies that have jurisdiction over safety and security will review all designs. At-grade crossing designs must be approved for safety by the California Public Utilities Commission.

IMPACTS AND MITIGATION MEASURES

What would the impacts be for street traffic, noise, and visual appearance if the project were underground? At street level? Above ground?
General impacts and methods to mitigate them are determined during the Alternatives Analysis Study. Studies will determine the general impacts for traffic, noise, visual, historic resources and other issue areas that are normally discussed in a NEPA/ CEQA document.

ENVIRONMENTAL PROCESS

What is an Alternatives Analysis? How does this fit into the overall environmental process?
An Alternatives Analysis is a preliminary study of a wide range of alternatives. The primary objective of this analysis is to narrow the number of alternatives that could be carried forward for further study. The Alternatives Analysis for this project will evaluate several rail and bus mode options, as well as alternative alignments and segment lengths. Based on the Alternatives Analysis, the Metro Board will be asked to select a Locally Preferred Alternative (LPA) identifying the alignment, mode, and station locations. The Metro Board may then direct that the selected LPA be further evaluated in a Draft Environmental Impact Statement (EIS)/Environmental Impact Report (EIR) and be subject to Preliminary Engineering.



Frequently Asked Questions

PROJECT SCHEDULE

What is the schedule for the study?
Metro's Board of Directors has authorized the completion of an Alternatives Analysis. Early scoping will be completed in November 2007. An initial screening or reduction of alternatives to be analyzed will be completed in February 2008 and the Alternatives Analysis report is anticipated to be completed by June 2008.

Is this study the final step in determining what will get built and when?
No. This is the first step in the project development and funding process. At the conclusion of the AA, Metro's Board of Directors may authorize conducting environmental studies per NEPA and CEQA on reasonable alternatives and a no-action alternative.

How much will the project cost? Where will the money for construction come from?
Cost figures will be developed with each alternative for this two-mile connection. At this time, funding will be identified from Federal, State and local sources.

PUBLIC INPUT

How can I be involved in the decision-making process? How can I stay informed about this study?
You can register to receive future updates on the project and meeting notices by visiting www.metro.net/regionalconnector or by calling the project information line at (213) 922-7277. The website will be updated frequently with additional meeting notifications and project related information.

Can Metro make a presentation to my neighborhood or business organization?
Yes. Metro and the project team is available to make presentations, upon request, to interested stakeholders. Please leave a message on the project phone line at (213) 922-7277, or visit the project website, and a Metro representative will contact you to arrange a meeting for your group or to invite you to one planned in your community.

公開スコープ会議が2009年3月4月に開催され、草案環境影響調査／再検討(EIS/R)期間中にMetroが調査しなければならない問題に関する意見を受け付けました。約200人が4回の会議に参加し、Metroは126件のコメントを受け取りました。草案EIS/Rスコープ過程における公式的な意見受付の期間は2009年5月に終了しましたが、あなたのご意見やアイデアは、継続して提出することができます。

Metroは開発全般にわたり、包括的かつ透明な地域アウトリーチと一般の参加に尽力しています。カリフォルニア州環境基準法(*CEQA*)および全国環境保護法(NEPA)で義務付けられる 公開スコープ会議と公聴会に加え、Metroは主要地域グループおよびプロジェクト利害関係者と積極的に連絡を取り、集中的な会議において、移動、生活の質、経済的持続性、文化／歴史的考慮、近隣に与える影響等に関する重要な問題に取り組んでいます。

あなたのご意見をお寄せください

次の方法で参加することができます

> 年2回の地域アップデート会議にご参加ください。この会議は当方の調査結果に関する情報を提供し、通常プロジェクトの主要里程標に合わせて行われます。次回の会議は2009年11月に予定しています。あなたの名前が当局の郵便・Eメールのリストに載っているのであれば、会議の案内が自動的に送られます。会議の案内をお望みなら、regionalconnector@metro.netまでEメールで、または電話213.922.7277.でご連絡ください。

>草案EIS/R完了が予定されている2010年の夏に、Metroは環境文書を発行し、数回にわたる公式的な公聴会を開催します。これらの公聴会についても通知を受け取ることができ、Metroは会議の情報を幅広く公表する予定です。

地域からの意見を反映するための他の手順

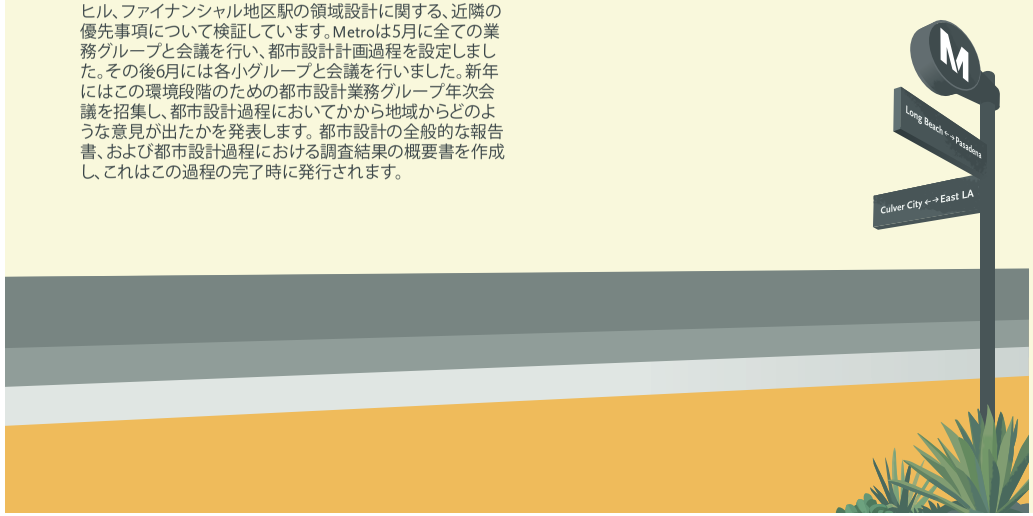
アウトリーチ過程の一環として、Metroは3つの地理的な小グループを含む、都市設計グループを召集します。これは2件の構造物の代替案に関する、提案されている駅の領域です。この小グループは、特にセコンド・ストリート、バンカー・ヒル、ファイナンシャル地区駅の領域設計に関する、近隣の優先事項について検証しています。Metroは5月に全ての業務グループと会議を行い、都市設計計画過程を設定しました。その後6月には各小グループと会議を行いました。新年にはこの環境段階のための都市設計業務グループ年次会議を招集し、都市設計過程においてかから地域からどのような意見が出たかを発表します。都市設計の全般的な報告書、および都市設計過程における調査結果の概要書を作成し、これはこの過程の完了時に発行されます。

集中的なアウトリーチ

都市設計業務グループは、Metroと地理的小グループとの相互作用をさらに活性化させ、特にリトル東京領域において、駐車場、ビジネス、工事中の近隣の影響、将来的な稼動などに関する懸念に取り組んでいます。それによって地域との建設的な対話が生じ、この地域の特定な問題に取り組むための、集中的なリトル東京業務グループが形成されました。この活動は2009年の9月に開始しました。

完了した会議および現行の会議

義務付けられている会議および集中業務グループに加え、Metroは個々のプロジェクト利害関係者に対して、定期的なプロジェクトのアップデートを提供し、質問や懸念に対して応答しています。この連絡先のリストは、あなたが計画過程に参加できるよう追加の利害関係者と協力していくにつれて、さらに長くなります。以下は現在までに完了した会議の概要です。



公式的な公開会議 公開EIS/Rスコープ会議

都市設計業務グループ

>セコンド・ストリート駅
>バンカー・ヒル駅
>ファイナンシャル地区駅

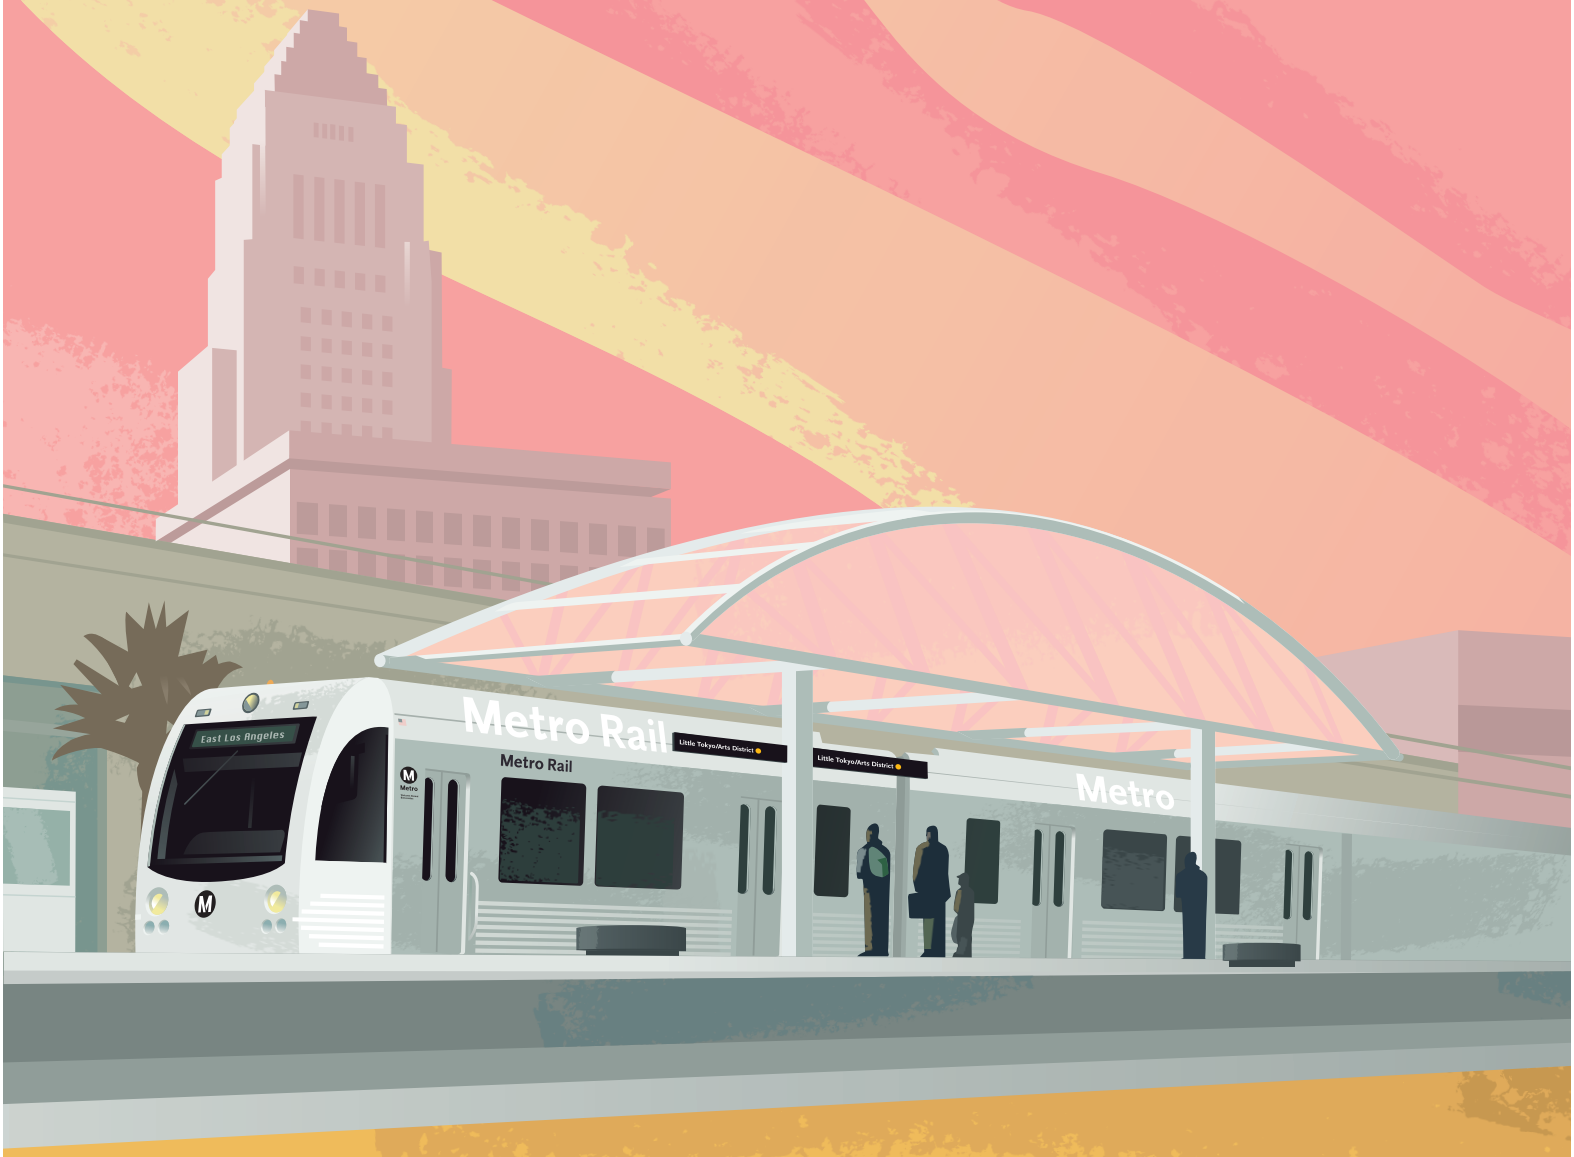
環境評価の過程



2009年11月

環境検討概要書

背景

地域コネクター軽鉄道交通機関（LRT）調査には、ロサンゼルスのダウンタウンを通過する7th Street Metro Center とUnion Station を結ぶ選択肢の分析が含まれています。このプロジェクトは2007年に代替分析調査として開始されました。ロサンゼルスのダウンタウンを通過する約33件の選択肢を、重要な判断基準に基づき開発・分析した後、選択肢分析の過程を通じて4件の選択肢に絞り込みました。2009年の初頭Metroの理事会はプロジェクトチームが次の段階に進むことを承認し、草案環境影響白書／報告書(Draft EIS/R)を作成して、次の4案件に関して詳細にわたる評価を開始しました。

> 構造なし
> 交通システム管理 (TSM)
> 道路と同一水平面のLRT 構造の代替案
> 地下のLRT構造の代替案

環境過程の概要

EIS/R 過程では、政府当局、利害関係者がプロジェクトを見直し、コメントする機会を提供するためのいくつかのステップがあります。

1. 意向通知(NOI)/準備通知 (NOP)

2009年3月(完了)

METROが行うこと

> Metro はCEQA/NEPA 過程を開始する。
> NEPAおよびCEQAで義務付けられているNOIとNOPの発行。

皆様の役割 (公衆の活動)

> NOI/NOPによりプロジェクトの開始とスコープ会議の予定を発表するが、スコープ会議に参加する以外の活動はなし。
> 公衆は環境分析に関して評価・コメントする機会を与えられる。

2. 公開のスコープ調査

2009年3月－5月　(完了)

METROが行うこと

> Metroは 2009年4月/5月に公開会議を開催する。
> 公衆も会議に参加し、Eメールや紙面でコメントしてもらうようにした。Metroは次の4ケ所で会議を開催した。Financial District、Little Tokyo、South Park/USC、Pasadena。合計175人が調査会議に参加し、口頭・紙面・Eメールのコメントを受け付けた。
> Metroはこれらの会議に関して、郵便、Eメール、Metroのトランジット・サービス、新聞広告、多種のメディア、地域ごとの広告手段を通じて広範囲に公表した。

皆様の役割 (公衆の活動)

> 公衆は環境分析に関して評価・コメントする機会を与えられる。
> MetroがDEIS/Rにおいて何を調査すべきか、即ちプロジェクトの目的と要件、EIS/Rにおける分析の他の選択肢、EIS/Rにおいて考えられるインパクトとその緩衝に関し、公衆がコメントできる最初の機会。
> DEIS/Rスコープ調査過程における公式的な公衆コメント受付は終了したが、公衆が自分の意見を提出できないということではない。Metroは継続的な透明な地域アウトリーチに尽力し、プロジェクト領域における利害関係者グループへの現行のアウトリーチとともに、重要なプロジェクトの要所要所で地域のアップデート会議を行う。
> 公衆の調査期間は2009年5月11日に終了。Metroは調査報告書にコメントを含め記録する。

3. 草案EIS/Rの作成

2009年の3月－2010年夏

METROが行うこと

> プロジェクトおよび、プロジェクトの設計と影響緩和に関し、地域との現行の作業における影響を分析する。
> その結果に関する情報をMetroは継続して提供する。その間Metroは4件の代替案に関しても引き続き分析する。質問によってはすぐに答えが出ないこともあるが、それに対しては必ず追って返答する。

皆様の役割 (公衆の活動)

> 公開会議に参加する。
> 次回の公開会議は2009年11月に開催する予定。
> 各地域の利害関係者会議を参観する。一般向けのアップデートに加え、プロジェクトの進行に沿って、Metroは組織やプロジェクトの利害関係者と話し合いを継続する。
> ここで地域における影響とそれを緩衝するための方策を話し合う。

NEPA および CEQA 過程

全国環境政策法 (NEPA) およびカリフォルニア州環境基準法 (CEQA) は、あらゆる悪影響を回避・軽減・緩衝するために、政府当局が彼らの活動における環境への影響を明確にすることを要求する法です。NEPAのための環境影響白書(EIS)およびCEQAのための環境影響報告書は、政府が行う、または政府の援助を受けて行う全ての活動に要求されています。本プロジェクトはNEPA とCEQAの承認が必要なため、合同のEIS/Rを作成します。

地域コネクターの EIS/R では、大気の質、文化・歴史的資源、地域的な影響、騒音、可視的な影響、土壌、水、生物学的資源等、提案されているプロジェクトに関する環境的な影響を幅広い観点で検討します。草案 EIS/R 段階では、Metroはまた本プロジェクト関し、工事中と稼動開始以後に生じる影響の可能性を調査し、悪影響を回避、軽減、緩衝する方策を検討します。この段階ではさらに、(平面線形、駅の場所を含み) 代替におけるコストの効率性、工事の資金調達オプション等も、Metroが詳細にわたり検討していきます。

4. 草案EIS/Rに関する公衆の評価およびコメント

*2010*年夏

METROが行うこと

> 草案環境文書を配布する。

> DEIS/R作成の終了にあたり、環境文書が完成し、公衆が評価できるようにMetroが配布する。Metroは文書がいつ配布されるかを知らせる。

> Metro は公式的な公聴会を開催し、公衆が草案EIS/Rに関してコメントできるようにする。

皆様の役割 (公衆の活動)

> 公衆が草案EIS/Rを見直し、影響、緩衝、その他の関連する問題に取り組む。

> 公聴会に参加し、環境過程の一環として、ここでもプロジェクトに関する公式的なコメントを提出する。このような方法で、公衆はプロジェクト設計と悪影響への緩衝方策が充分であるかについて、取り組むことができる。

> 公聴会は暫定的に2010年夏に開催する予定。

5. 理事会は地域優先の代替選択肢(LPA)を選択する。

*2010*年晩夏／初秋

METROが行うこと

> Metroの 理事会は地域優先の代替選択肢 LPAを選択する。

> Metro のスタッフはMetroの理事会に対してDEIS/Rに関する考察を発表する。理事会はLPAの承認を行い、スタッフに対して最終EIS/Rを作成するよう指示する。LPAは最終EIS/Rへ進行する定められるプロジェクト。

> Metroの理事会は連邦交通省に対して、初期エンジニアリング、即ちプロジェクトを実行するための最終図面と設計図を開発する承認を求める。

皆様の役割 (公衆の活動)

> 公衆はMetro理事会に、LPA提案におけるコメントを提出する。

> Metro理事会の会議に参加する。ここではMetro理事会に対して、実行に移すプロジェクトに関して意見を述べることができる。この時にあなたの望むプロジェクトについて発表することができる。

6. 最終EIS/Rの作成

*2010/11*年夏

METROが行うこと

> Metro は 最終EIS/Rに関するEIS/Rのコメントに対して返答する。

> Metro はを配布し、公衆に評価してもらう。

> この過程はNEPA/CEQAを遵守するもの。

皆様の役割 (公衆の活動)

> 公衆の活動なし。

> 最終EIS/Rの時点では、草案EIS/R期間の公衆のコメントに対して応答済み。決定記録に対する承認の前に、公衆が最終EIS/Rを見直す30日の期間がある。

7. 理事会の決定/プロジェクトの承認

*2011*年夏

METROが行うこと

> Metroの理事会は地域コネクタープロジェクトの工事。

> Metroのスタッフは理事会に対して、実行することを提案する地域コネクタープロジェクトに関して、最終的な発表をする。理事会がスタッフの提案を承認した場合に限り、プロジェクトを着工する。

皆様の役割 (公衆の活動)

> 公衆の提案に関するコメント理事会に提出する。

> 公衆はこの機会に、理事会が決定する前の最終コメントを提出する。

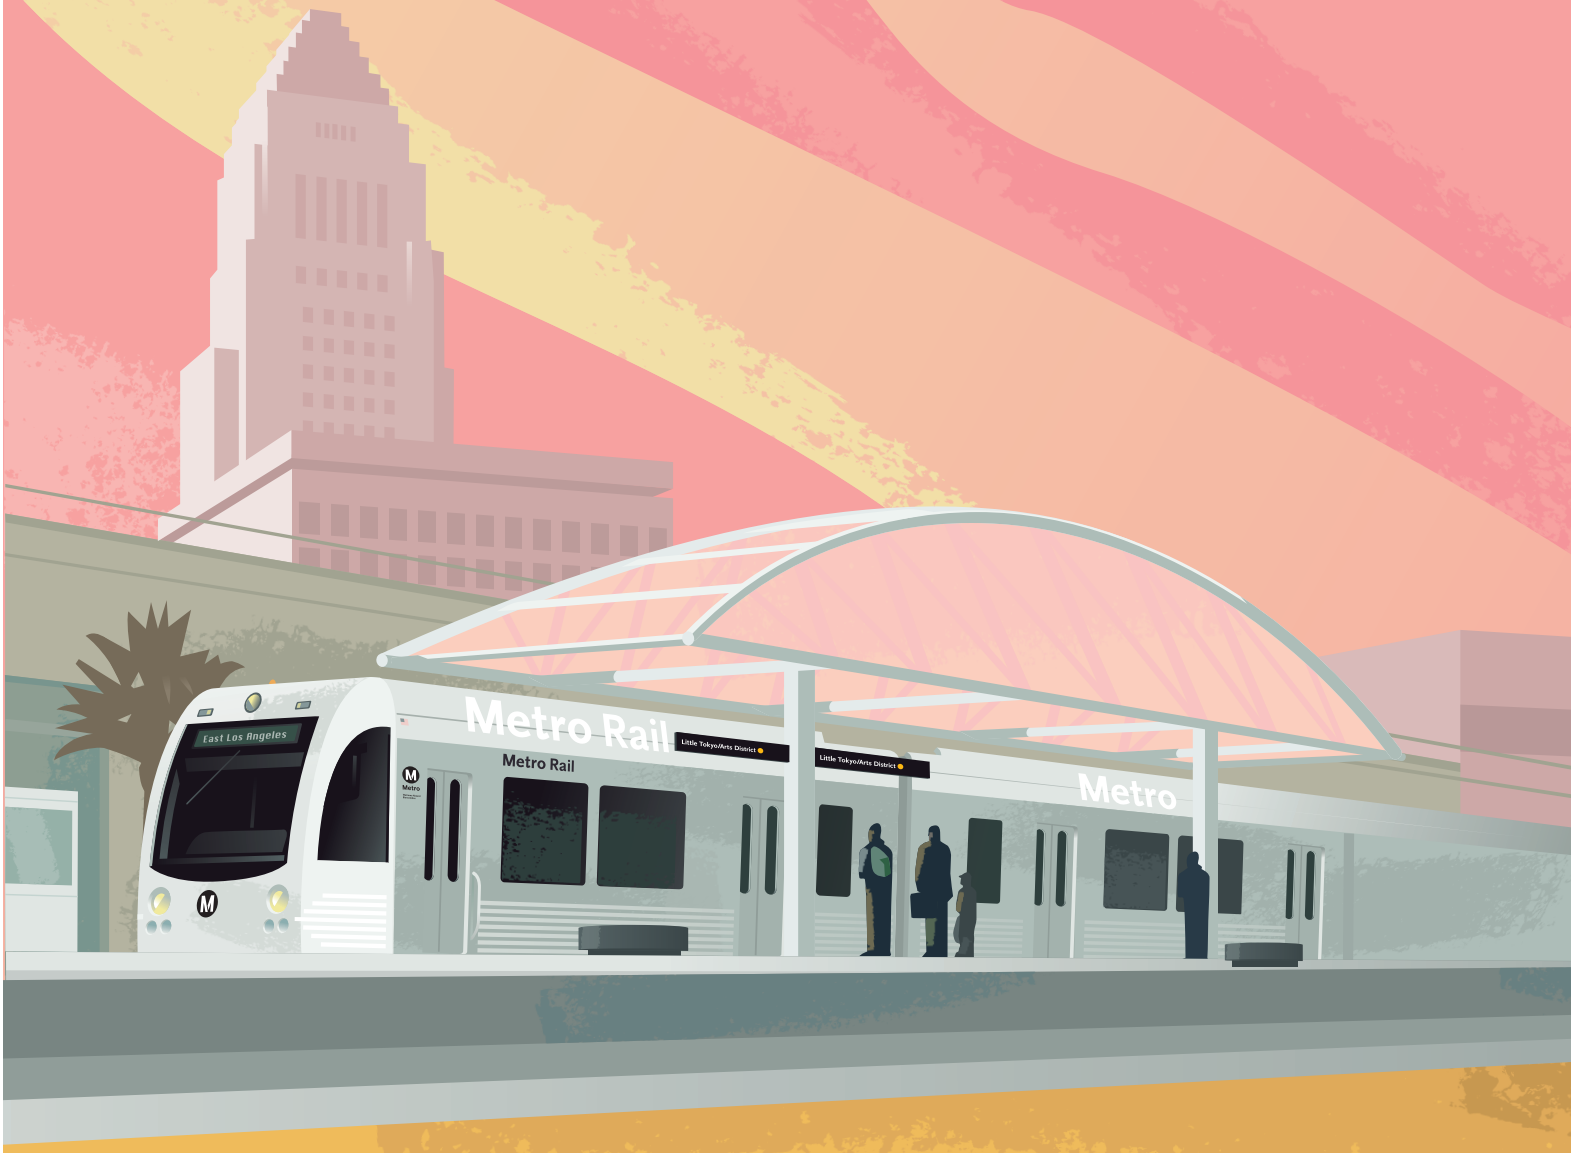
Corredor de Transporte Conector Regional

Proceso de Revisión Ambiental



NOVIEMBRE 2009

Hoja Informativa

Antecedentes

El estudio del Conector Regional de transporte de tren ligero (LRT) incluye un análisis de alternativas para conectar la Estación 7th Street/Metro Center y Union Station a través del Centro de Los Angeles. El proyecto fue iniciado en el 2007 con un Estudio de Análisis de Alternativas. Aproximadamente 33 alternativas para pasar por el Centro de Los Angeles fueron desarrolladas y analizadas basadas en un número de criterios importantes, luego fueron reducidas por el proceso de Análisis de Alternativas a cuatro alternativas. A comienzos del 2009, la Junta Directiva de Metro autorizó al equipo del proyecto a moverse hacia la siguiente fase del proyecto y empezar a trabajar en el Borrador de la Declaración/Reporte del Impacto Ambiental (Borrador EIS/R) para examinar y completar una revisión cabal de las siguientes cuatro alternativas:

> No Construcción

> Administración de Sistemas de Transporte (TSM)

> Alternativa de Construcción de LRT, énfasis a nivel

> Alternativa de Construcción de LRT, énfasis subterráneo

Resumen del Proceso Ambiental

Hay varios pasos en el proceso del EIS/R que proveen a las agencias, personas interesadas en el proyecto y público en general la oportunidad para revisar el proyecto y proporcionar sus comentarios.

1. Notificación de intención (NOI) y notificación de preparación (NOP)

Marzo del 2009 (Completo)

LO QUE METRO HACE

> Metro inicia el proceso de CEQA/NEPA.

> Publicación del NOI/NOP para cumplir con los requisitos de NEPA y CEQA.

SU PAPEL (ACCION PUBLICA)

> El NOI/NOP anuncia el principio del proyecto y las próximas reuniones de alcance, y no requiere ninguna accion publica aparte de la participación en el alcance.

2. Alcance público

Marzo - mayo del 2009 (Completo)

LO QUE METRO HACE

> Metro llevó a cabo reuniones de alcance público en abril/mayo de 2009.

> El público también fue invitado a mandar comentarios por correo electrónico o correspondencia. Metro realizó las reuniones en cuatro lugares: Financial District, Little Tokyo, South Park/USC y Pasadena. Un total de 175 personas asistió a las reuniones de alcance, y se recibieron 126 comentarios verbales, escritos y enviados por correo electrónico.

> Metro hizo públicas estas reuniones por medio de correspondencia y correo electrónico, en el servicio de tránsito de Metro, por publicidades de periódico, diversos medios de comunicación y anuncios en los vecindarios.

SU PAPEL (ACCION PUBLICA)

> Se le proporciona al público una oportunidad para revisar y hacer comentarios sobre el análisis ambiental.

> La primera oportunidad del público para proporcionar comentarios acerca de lo que Metro debería estudiar en el Borrador EIS/R, por ejemplo: el propósito y necesidad del proyecto, alternativas para análisis en el EIS/R y los posibles impactos y mitigaciones para análisis en el EIS/R.

> El período oficial para comentarios públicos ha terminado, pero no significa que ya no pueda proveer su aporte. Metro está comprometido a un proceso continuo y transparente de alcance comunitario que incluye reuniones de actualización con la comunidad en hitos importantes del proyecto y alcance continuo con grupos clave interesados en el área del proyecto.

> El periodo de alcance público cerró el 11 de mayo de 2009. Metro registrará e incluirá todos los comentarios en el reporte del alcance.

3. Preparación del Borrador EIS/R

Marzo de 2009 - verano de 2010

LO QUE METRO HACE

> Analizar los impactos del proyecto y el trabajo continuo con la comunidad en el diseño del proyecto y las mitigaciones.

> Continuar proveyendo información actualizada a medida que los resultados estén disponibles. Sin embargo, Metro todavía está analizando las cuatro alternativas. Si no podemos contestar sus preguntas inmediatamente, tenemos el compromiso de hacer el seguimiento cuando tengamos las respuestas.

SU PAPEL (ACCION PUBLICA)

> Asista a reuniones públicas.

> La siguiente ronda de reuniones públicas está programada para noviembre del 2009

> Esté atento a reuniones para las personas interesadas en su comunidad. Además de las actualizaciones públicas, Metro continuará reuniéndose con organizaciones y personas interesadas en el proyecto a medida que el proyecto avanza.

> Ahora es el momento de hablar sobre lo que usted piensa que son los impactos y cómo pueden ser mitigados.

NEPA and CEQA Process

La ley de política ambiental nacional (NEPA) y la ley de calidad ambiental de California (CEQA) son leyes que requieren que agencias gubernamentales identifiquen los impactos signifcantes de sus acciones hacía el medioambiente y eviten, reduzcan o mitiguen cualquier efecto desfavorable. Una Declaración de Impacto Ambiental (EIS) para NEPA y un Reporte de Impacto Ambiental (EIR) para CEQA son requeridos para cualquier acción que sea tomada por el gobierno o que recibe financiación de éste. Este proyecto requiere aprobaciones de NEPA y CEQA, por lo cual se preparará un EIS/R en conjunto.

El EIS/R para el Conector Regional considerará los impactos medioambientales del proyecto propuesto en una gran variedad de temas como calidad de aire, recursos culturales e históricos, efectos a la comunidad, ruido, impactos visuales, tierra, agua, recursos biológicos y otros. Durante la fase del Borrador EIS/R, Metro también estudiará los efectos potenciales del proyecto durante su construcción y una vez que esté operando, y evaluará medidas para evitar, minimizar y mitigar efectos desfavorables. Durante esta fase, Metro mejorará las alternativas (incluyendo alineaciones y lugares para las estaciones), incluyendo la consideración de la eficacia de costos de las alternativas y opciones de financiamiento para la construcción.

4. Revisión pública y comentario sobre el Borrador EIS/R

Verano de 2010

LO QUE METRO HACE

> Circular el borrador del documento ambiental.

> Cuando se concluya la preparación del Borrador EIS/R, el documento ambiental estará disponible y será circulado por Metro para revisión. Metro informará al público cuando el documento esté disponible.

> Metro llevará a cabo audiencias públicas formales a fin de que el público puede hacer comentarios sobre el Borrador EIS/R.

SU PAPEL (ACCION PUBLICA)

> El público revisa el Borrador EIS/R, ocupándose de impactos, mitigaciones u otros asuntos pertinentes.

> Asista a audiencias públicas para otra vez proveer comentarios formales acerca del proyecto como parte del proceso ambiental. De este modo, el público puede hablar sobre el diseño del proyecto y de medidas de mitigación adecuadas.

> Las audiencias públicas están tentativamente programadas para el verano del 2010.

5. La Junta Directiva selecciona la alternativa preferida localmente (LPA)

Final de verano/Comienzo del otoño 2010

LO QUE METRO HACE

> La Junta Directiva de Metro selecciona la LPA.

> El personal de Metro presentará las conclusiones del Borrador EIS/R a la Junta Directiva de Metro. Se pedirá a la Junta Directiva que adopte la LPA para su aprobación y que dirija al personal para completar el EIS/R Final. La LPA es el proyecto identificado para avanzar al EIS/R Final.

> Luego, la Junta Directiva buscará la aprobación de la agencia de transporte federal (FTA) para empezar la ingeniería preliminar, por ejemplo: el desarrollo de planos y planes finales para que el proyecto sea implementado.

SU PAPEL (ACCION PUBLICA)

> Comentario del público a la Junta Directiva sobre las recomendaciones de la LPA.

> Asista a la reunión de la Junta Directiva. En este momento tendrá una oportunidad para hablarle a la Junta Directiva acerca del proyecto que avanzará a implementación. Aquí es cuando puede hablar con la Junta Directiva acerca del proyecto que usted quiere ver.

6. Preparación del EIS/R Final

Verano de 2010/11

LO QUE METRO HACE

> Metro responderá a los comentarios sobre el Borrador EIS/R en el EIS/R Final.

> Metro circula el EIS/R Final para revisión pública.

> Este proceso está en conformidad con NEPA/CEQA.

SU PAPEL (ACCION PUBLICA)

> Ninguna accion publica

> El EIS/R Final habrá respondido a los comentarios públicos durante el Borrador EIS/R. Habrá un período de 30 días para la revisión pública del EIS/R Final antes de la aprobación del registro de decisión.

7. Aprobación de la Junta Directiva de la decisión/ proyecto

Verano de 2011

LO QUE METRO HACE

> La Junta Directiva de Metro decidirá si seguirá hacia delante con la construcción del proyecto del Conector Regional.

> El personal de Metro hará su presentación final a la Junta Directiva acerca del proyecto del Conector Regional recomendado implementación. Si la Junta Directiva aprueba la recomendación del personal, sólo entonces puede ser construido el proyecto.

SU PAPEL (ACCION PUBLICA)

> Comentarios públicos hechos a la Junta Directiva acerca de la recomendación.

> El público tendrá esta oportunidad para proporcionar sus comentarios finales a la Junta Directiva de Metro antes de que una decisión sea tomada.

Cómo contactarnos y permanecer involucrado

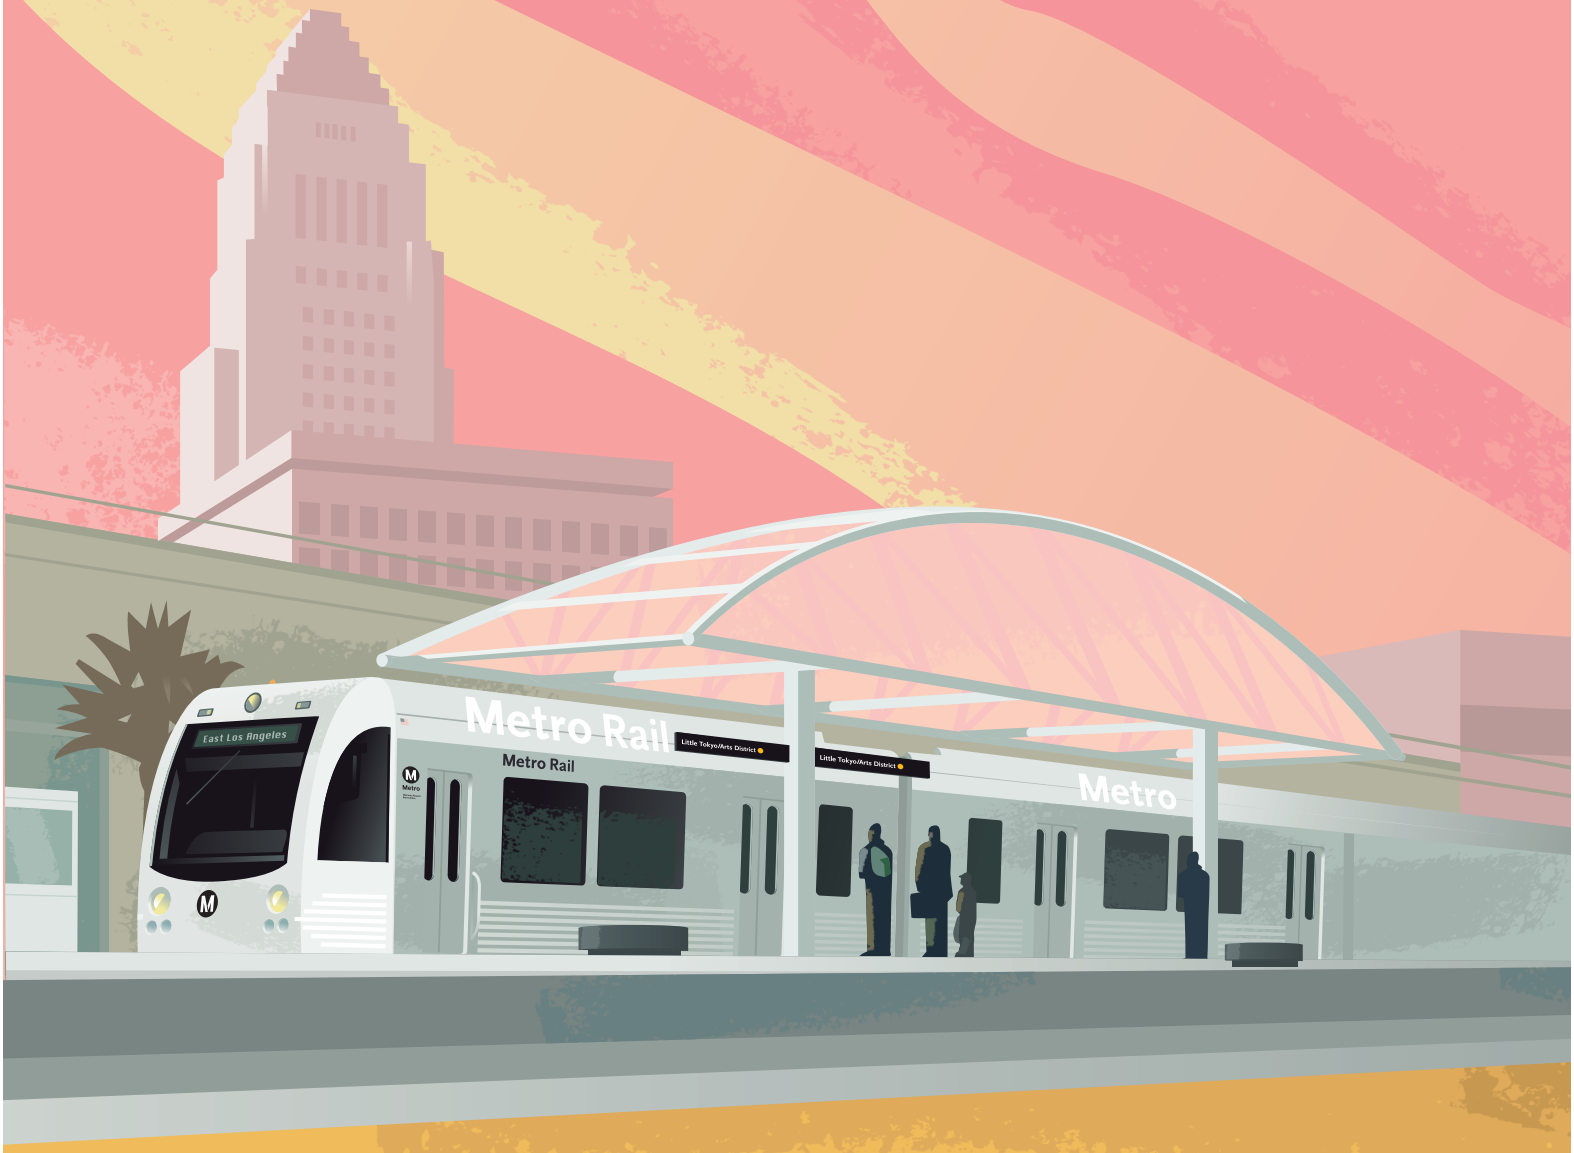
Corredor de Transporte Conector Regional

Proceso de Revisión Ambiental



NOVIEMBRE 2009

Hoja Informativa

Antecedentes

El estudio del Conector Regional de transporte de tren ligero (LRT) incluye un análisis de alternativas para conectar la Estación 7th Street/Metro Center y Union Station a través del Centro de Los Angeles. El proyecto fue iniciado en el 2007 con un Estudio de Análisis de Alternativas. Aproximadamente 33 alternativas para pasar por el Centro de Los Angeles fueron desarrolladas y analizadas basadas en un número de criterios importantes, luego fueron reducidas por el proceso de Análisis de Alternativas a cuatro alternativas. A comienzos del 2009, la Junta Directiva de Metro autorizó al equipo del proyecto a moverse hacia la siguiente fase del proyecto y empezar a trabajar en el Borrador de la Declaración/Reporte del Impacto Ambiental (Borrador EIS/R) para examinar y completar una revisión cabal de las siguientes cuatro alternativas:

> No Construcción

> Administración de Sistemas de Transporte (TSM)

> Alternativa de Construcción de LRT, énfasis a nivel

> Alternativa de Construcción de LRT, énfasis subterráneo

Resumen del Proceso Ambiental

Hay varios pasos en el proceso del EIS/R que proveen a las agencias, personas interesadas en el proyecto y público en general la oportunidad para revisar el proyecto y proporcionar sus comentarios.

1. Notificación de intención (NOI) y notificación de preparación (NOP)

Marzo del 2009 (Completo)

LO QUE METRO HACE

> Metro inicia el proceso de CEQA/NEPA.

> Publicación del NOI/NOP para cumplir con los requisitos de NEPA y CEQA.

SU PAPEL (ACCION PUBLICA)

> El NOI/NOP anuncia el principio del proyecto y las próximas reuniones de alcance, y no requiere ninguna accion publica aparte de la participación en el alcance.

2. Alcance público

Marzo - mayo del 2009 (Completo)

LO QUE METRO HACE

> Metro llevó a cabo reuniones de alcance público en abril/mayo de 2009.

> El público también fue invitado a mandar comentarios por correo electrónico o correspondencia. Metro realizó las reuniones en cuatro lugares: Financial District, Little Tokyo, South Park/USC y Pasadena. Un total de 175 personas asistió a las reuniones de alcance, y se recibieron 126 comentarios verbales, escritos y enviados por correo electrónico.

> Metro hizo públicas estas reuniones por medio de correspondencia y correo electrónico, en el servicio de tránsito de Metro, por publicidades de periódico, diversos medios de comunicación y anuncios en los vecindarios.

SU PAPEL (ACCION PUBLICA)

> Se le proporciona al público una oportunidad para revisar y hacer comentarios sobre el análisis ambiental.

> La primera oportunidad del público para proporcionar comentarios acerca de lo que Metro debería estudiar en el Borrador EIS/R, por ejemplo: el propósito y necesidad del proyecto, alternativas para análisis en el EIS/R y los posibles impactos y mitigaciones para análisis en el EIS/R.

> El período oficial para comentarios públicos ha terminado, pero no significa que ya no pueda proveer su aporte. Metro está comprometido a un proceso continuo y transparente de alcance comunitario que incluye reuniones de actualización con la comunidad en hitos importantes del proyecto y alcance continuo con grupos clave interesados en el área del proyecto.

> El periodo de alcance público cerró el 11 de mayo de 2009. Metro registrará e incluirá todos los comentarios en el reporte del alcance.

3. Preparación del Borrador EIS/R

Marzo de 2009 - verano de 2010

LO QUE METRO HACE

> Analizar los impactos del proyecto y el trabajo continuo con la comunidad en el diseño del proyecto y las mitigaciones.

> Continuar proveyendo información actualizada a medida que los resultados estén disponibles. Sin embargo, Metro todavía está analizando las cuatro alternativas. Si no podemos contestar sus preguntas inmediatamente, tenemos el compromiso de hacer el seguimiento cuando tengamos las respuestas.

SU PAPEL (ACCION PUBLICA)

> Asista a reuniones públicas.

> La siguiente ronda de reuniones públicas está programada para noviembre del 2009

> Esté atento a reuniones para las personas interesadas en su comunidad. Además de las actualizaciones públicas, Metro continuará reuniéndose con organizaciones y personas interesadas en el proyecto a medida que el proyecto avanza.

> Ahora es el momento de hablar sobre lo que usted piensa que son los impactos y cómo pueden ser mitigados.

NEPA and CEQA Process

La ley de política ambiental nacional (NEPA) y la ley de calidad ambiental de California (CEQA) son leyes que requieren que agencias gubernamentales identifiquen los impactos signifcantes de sus acciones hacía el medioambiente y eviten, reduzcan o mitiguen cualquier efecto desfavorable. Una Declaración de Impacto Ambiental (EIS) para NEPA y un Reporte de Impacto Ambiental (EIR) para CEQA son requeridos para cualquier acción que sea tomada por el gobierno o que recibe financiación de éste. Este proyecto requiere aprobaciones de NEPA y CEQA, por lo cual se preparará un EIS/R en conjunto.

El EIS/R para el Conector Regional considerará los impactos medioambientales del proyecto propuesto en una gran variedad de temas como calidad de aire, recursos culturales e históricos, efectos a la comunidad, ruido, impactos visuales, tierra, agua, recursos biológicos y otros. Durante la fase del Borrador EIS/R, Metro también estudiará los efectos potenciales del proyecto durante su construcción y una vez que esté operando, y evaluará medidas para evitar, minimizar y mitigar efectos desfavorables. Durante esta fase, Metro mejorará las alternativas (incluyendo alineaciones y lugares para las estaciones), incluyendo la consideración de la eficacia de costos de las alternativas y opciones de financiamiento para la construcción.

4. Revisión pública y comentario sobre el Borrador EIS/R

Verano de 2010

LO QUE METRO HACE

> Circular el borrador del documento ambiental.

> Cuando se concluya la preparación del Borrador EIS/R, el documento ambiental estará disponible y será circulado por Metro para revisión. Metro informará al público cuando el documento esté disponible.

> Metro llevará a cabo audiencias públicas formales a fin de que el público puede hacer comentarios sobre el Borrador EIS/R.

SU PAPEL (ACCION PUBLICA)

> El público revisa el Borrador EIS/R, ocupándose de impactos, mitigaciones u otros asuntos pertinentes.

> Asista a audiencias públicas para otra vez proveer comentarios formales acerca del proyecto como parte del proceso ambiental. De este modo, el público puede hablar sobre el diseño del proyecto y de medidas de mitigación adecuadas.

> Las audiencias públicas están tentativamente programadas para el verano del 2010.

5. La Junta Directiva selecciona la alternativa preferida localmente (LPA)

Final de verano/Comienzo del otoño 2010

LO QUE METRO HACE

> La Junta Directiva de Metro selecciona la LPA.

> El personal de Metro presentará las conclusiones del Borrador EIS/R a la Junta Directiva de Metro. Se pedirá a la Junta Directiva que adopte la LPA para su aprobación y que dirija al personal para completar el EIS/R Final. La LPA es el proyecto identificado para avanzar al EIS/R Final.

> Luego, la Junta Directiva buscará la aprobación de la agencia de transporte federal (FTA) para empezar la ingeniería preliminar, por ejemplo: el desarrollo de planos y planes finales para que el proyecto sea implementado.

SU PAPEL (ACCION PUBLICA)

> Comentario del público a la Junta Directiva sobre las recomendaciones de la LPA.

> Asista a la reunión de la Junta Directiva. En este momento tendrá una oportunidad para hablarle a la Junta Directiva acerca del proyecto que avanzará a implementación. Aquí es cuando puede hablar con la Junta Directiva acerca del proyecto que usted quiere ver.

6. Preparación del EIS/R Final

Verano de 2010/11

LO QUE METRO HACE

> Metro responderá a los comentarios sobre el Borrador EIS/R en el EIS/R Final.

> Metro circula el EIS/R Final para revisión pública.

> Este proceso está en conformidad con NEPA/CEQA.

SU PAPEL (ACCION PUBLICA)

> Ninguna accion publica

> El EIS/R Final habrá respondido a los comentarios públicos durante el Borrador EIS/R. Habrá un período de 30 días para la revisión pública del EIS/R Final antes de la aprobación del registro de decisión.

7. Aprobación de la Junta Directiva de la decisión/ proyecto

Verano de 2011

LO QUE METRO HACE

> La Junta Directiva de Metro decidirá si seguirá hacia delante con la construcción del proyecto del Conector Regional.

> El personal de Metro hará su presentación final a la Junta Directiva acerca del proyecto del Conector Regional recomendado implementación. Si la Junta Directiva aprueba la recomendación del personal, sólo entonces puede ser construido el proyecto.

SU PAPEL (ACCION PUBLICA)

> Comentarios públicos hechos a la Junta Directiva acerca de la recomendación.

> El público tendrá esta oportunidad para proporcionar sus comentarios finales a la Junta Directiva de Metro antes de que una decisión sea tomada.

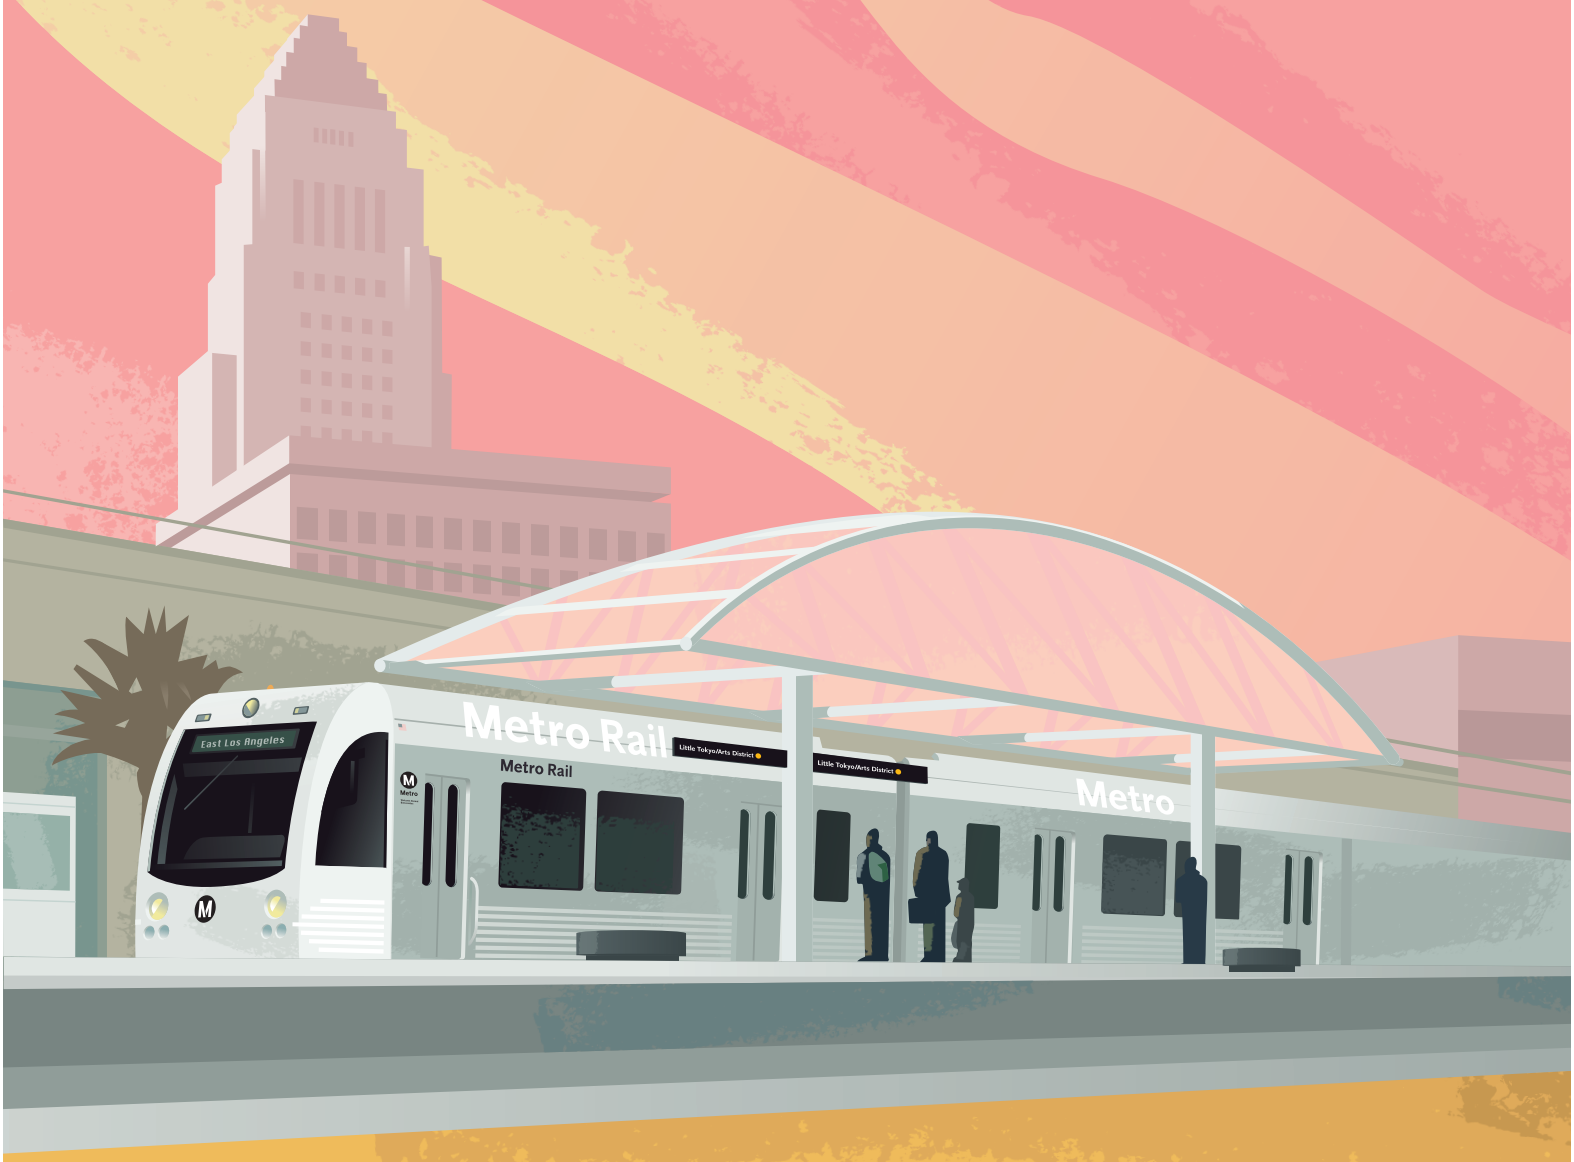
Regional Connector Transit Corridor Study

Environmental Review Process



NOVEMBER 2009

Environmental Review Fact Sheet

Background

The Regional Connector Light Rail Transit (LRT) study includes an analysis of alternatives to connect the 7th Street Metro Center and Union Station through Downtown Los Angeles. The project was initiated in 2007 with an Alternatives Analysis Study. Approximately 33 alternatives traversing Downtown Los Angeles were developed and analyzed based on a number of important criteria, then narrowed by the Alternative Analysis process to four alternatives. In early 2009, the Metro Board of Directors authorized the project team to move into the next phase of the project and begin work on a Draft Environmental Impact Statement/Report (Draft EIS/EIR) to examine and complete a thorough review of the following four alternatives:

> No Build

> Traffic Systems Management (TSM)

> LRT Build Alternative, At-Grade Emphasis

> LRT Build Alternative, Underground Emphasis

Summary of Environmental Process

There are several steps in the EIS/EIR process that provide agencies, project stakeholders and the general public the opportunity to review the project and provide comments.

1. Notice of Intent (NOI)/ Notice of Preparation (NOP)

March 2009 (Complete)

WHAT METRO DOES

> Metro initiates the CEPA/NEPA process.

> Publication of NOI and NOP to meet the requirements of NEPA and CEQA.

YOUR ROLE (PUBLIC ACTION)

> The NOI/NOP announces the start of the project and upcoming scoping meetings, and does not require public action other than participation in scoping.

> Public is provided an opportunity to review and comment on Scope of the Environmental Analysis.

2. Public Scoping

March - May 2009 (Complete)

WHAT METRO DOES

> Metro conducted public scoping meetings in April/May 2009.

> The public was also invited to comment by e-mail or letter. Metro held meetings at four locations: Financial District, Little Tokyo, South Park/USC and Pasadena. A total of 175 people attended the scoping meetings, with 126 verbal, written and email comments received.

> Metro publicized these meetings widely, including mail and email, on Metro transit service, via newspaper advertisements, diverse media, and neighborhood canvassing.

YOUR ROLE (PUBLIC ACTION)

> Public is provided an opportunity to review and comment on Scope of the Environmental Analysis.

> Public's first opportunity to provide comment about what Metro should study in the DEIS/EIR, e.g. project purpose and need, alternatives for analysis in the EIS/EIR and potential impacts and mitigations for analysis in the EIS/EIR.

> Although the official public comment period for the DEIS/R scoping process has closed, this does not mean that you can no longer provide your input. Metro is committed to an ongoing, transparent community outreach process which includes community update meetings at important project milestones, as well as ongoing outreach to key stakeholder groups in the project area.

> Public Scoping period closed on May 11, 2009. Metro will record and include all comments in the Scoping Report.

3. Prepare Draft EIS/EIR

March 2009 - Summer 2010

WHAT METRO DOES

> Analyze project impacts and ongoing work with the community on project design and mitigations.

> Metro will continue to provide updated information as results become available. However, Metro is still analyzing the four alternatives. If we are not able to answer your questions immediately, we are committed to following up when we have an answer.

YOUR ROLE (PUBLIC ACTION)

> Attend public meetings.

> Next round of public meetings scheduled for November 2009.

> Be on the lookout for stakeholder meetings in your community. In addition to the public updates, Metro will continue to meet with organizations and project stakeholders as the project moves forward.

> Now is the time to talk about what you think the impacts are and how they can be mitigated.

NEPA and CEQA Process

The National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA) are laws that require government agencies to identify the significant environmental impact of their actions and to avoid, minimize or mitigate any adverse effects. An Environmental Impact Statement (EIS) for NEPA and an Environmental Impact Report (EIR) for CEQA are required for any action that is taken by the government or receives government funding. This project requires approvals from both NEPA and CEQA, and therefore a joint EIS/EIR will be prepared.

The EIS/EIR for the Regional Connector will consider the proposed project's environmental impacts on a wide range of topics such as air quality, cultural and historic resources, community effects, noise, visual impacts, soil, water, biological resources and others. During the Draft EIS/EIR phase, Metro will also study the potential effects of the project both during construction and once it is operating, and will evaluate measures to avoid, minimize and mitigate adverse impacts. During this phase, Metro will further refine the alternatives (including alignments and station locations), including consideration of the cost effectiveness of the alternatives and funding options for construction.

4. Public Review & Comment On Draft EIS/EIR

Summer 2010

WHAT METRO DOES

> Circulate Draft Environmental Document.

> At the conclusion of the DEIS/EIR preparation, the environmental document is available and will be circulated by Metro for public review. Metro will inform the public when the document is available.

> Metro will host formal public hearings so that the public may comment on the Draft EIS/EIR.

YOUR ROLE (PUBLIC ACTION)

> Public reviews Draft EIS/EIR, addressing impacts, mitigations or other relevant issues.

> Attend public hearings to again provide formal comment about the project as part of the environmental process. In this way, the public can address project design and adequacy of mitigation measures.

> Public hearings tentatively scheduled in summer 2010.

5. Board Selects Locally Preferred Alternative (LPA)

Late Summer/Early Fall 2010

WHAT METRO DOES

> Metro Board selects Locally Preferred Alternative.

> Metro staff will present findings of DEIS/EIR to Metro Board of Directors. The Board will be asked to adopt LPA for approval and direct staff to complete the Final EIS/EIR. The LPA is the project identified to move forward into the Final EIS/EIR.

> Metro Board then will seek approval from Federal Transportation Agency (FTA) to begin Preliminary Engineering i.e., development of final drawings and plans for the project to be implemented.

YOUR ROLE (PUBLIC ACTION)

> Public comment to Metro Board on the LPA recommendations.

> Attend the Metro Board of Directors meeting. At this time, you will have an opportunity to speak to the Metro Board about the project that will move forward to implementation. This is when you can speak to the Board about the project you want to see.

6. Prepare Final EIS/EIR

Summer 2010/11

WHAT METRO DOES

> Metro will respond to comments on the Draft EIS/EIR in the Final EIS/EIR.

> Metro circulates the FEIS/EIR for public review.

> This process is in compliance with NEPA/CEQA.

YOUR ROLE (PUBLIC ACTION)

> No public action.

> The Final EIS/R will have responded to public comments during the Draft EIS/EIR. There will be a 30 day period for public review of the Final EIS/EIR prior to approval of the Record of Decision.

7. Board Decision/Project

Approval Summer 2011

WHAT METRO DOES

> Metro Board will decide whether to move forward with construction of Regional Connector project.

> Metro staff will make its final presentation to the Board about the Regional Connector project recommended for implementation. If the Board approves the staff recommendation, it is only then that a project may be constructed.

YOUR ROLE (PUBLIC ACTION)

> Public Comments made to Board about recommendation.

> The public will have this opportunity to provide final comments to the Metro Board before a decision is made.

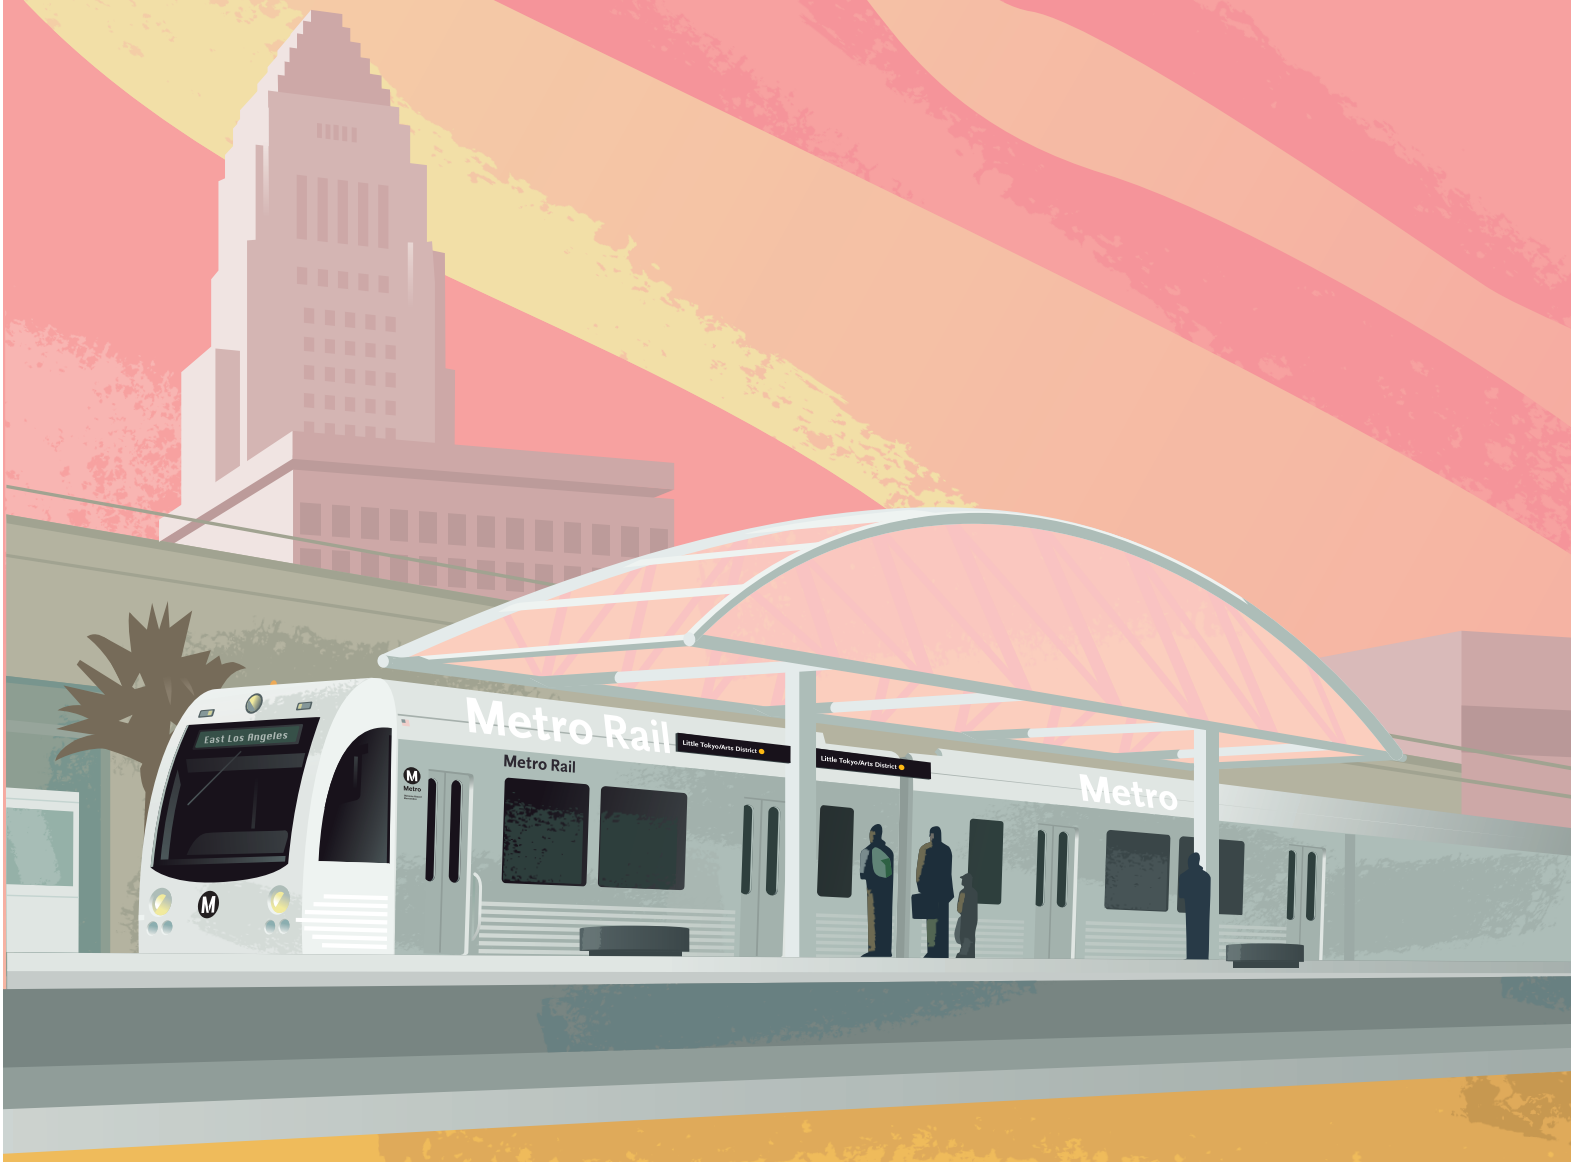
Regional Connector Transit Corridor Study

Draft EIS/R: Public Engagement and Community Participation



NOVEMBER 2009

Community Participation Fact Sheet

Public scoping meetings were held in March/April 2009 *to receive the community's input on issues Metro should study during the Draft Environmental Impact Study/ Review (EIS/R). Approximately 200 people attended four meetings and Metro received 126 comments. Although the official public comment period for the Draft EIS/R scoping process closed on May 11, 2009, you can continue to share your thoughts and ideas.*

GIVE US YOUR INPUT

Here Are the Ways You Can Participate

> Attend our bi-annual community update meetings. These meetings are intended to be a conduit of new information about our findings and usually coincide with important project milestones. Our next series of meetings will take place in November 2009. If you are on our mail or email list, you will automatically receive meeting invitations. To sign up for meeting notices, email us at *regionalconnector@metro.net* or call our information line at 213.922.7277.

> At the culmination of the Draft EIS/R, anticipated in the summer of 2010, Metro will circulate the environmental document and will hold a series of formal public hearings. Again, you will be notified of these meetings and Metro will publicize meeting information widely.

Other Community Input Mechanisms

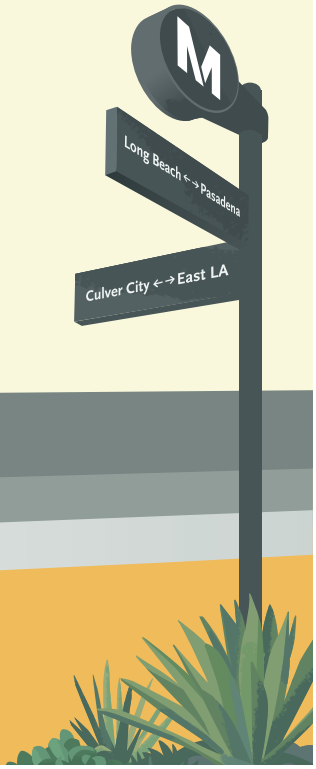
As part of the outreach process, Metro convened an Urban Design Working Group, with three geographic subgroups, coinciding with the proposed station areas for the two build alternatives. These subgroups are looking at neighborhood priorities for station area design specifically around 2nd Street, Bunker Hill and the Financial District. In May, Metro met with the full Working Group to set the stage for the urban design planning process; this was followed by a meeting with each of the geographic subgroups in June. A final Urban Design Working Group meeting for this environmental phase will be convened in the new year to share the results of what we heard from these communities during the urban design process. A full report on urban design, as well as a fact sheet on the findings of the urban design process will be developed and distributed at the culmination of this effort.

Focused Outreach

The Urban Design Working Group sparked further interaction between Metro and the geographic subgroups, especially in the Little Tokyo area, to address specific neighborhood concerns such as parking, business and neighborhood impacts during construction and future operations. This led to a constructive dialog with the community and the formation of a focused Little Tokyo Working Group to address issues specific to this community. This effort commenced in September 2009.

Completed and Ongoing Meetings

In addition to the required meetings and the focused Working Groups, Metro has continued to reach out to individual project stakeholders to provide regular project updates and to respond to questions and concerns. This list of contacts continues to grow as we work with additional stakeholders to involve you in the planning process. Following is a summary of meetings completed to date:



Metro is committed to an inclusive, transparent community outreach and public involvement effort *throughout the development. In addition to the public scoping meetings and hearings that are required for the California Environmental Quality Act (CEQA) and National Environmental Protection Act (NEPA) processes, Metro is working to proactively engage key community groups and project stakeholders at focused meetings to address important issues that affect mobility, quality of life, economic sustainability, cultural/historic considerations and neighborhood impacts.*

FORMAL PUBLIC MEETINGS *Public EIS/EIR Scoping Meetings*

Urban Design Working Group

> 2nd Street Station

> Bunker Hill Station

> Financial District Station

Stakeholder Meeting(s)/Briefing(s)

> Bringing Back Broadway

> Central City Association

> Central City East Association

> Go For Broke

> Japanese American National Museum

> Japanese Chamber of Commerce of Southern California

> Little Tokyo Community Council, including Planning and Cultural Preservation Committee (PCPC)

> Little Tokyo Service Center

> Los Angeles Conservancy

> Museum of Contemporary Art

> University of Southern California

Agency Meetings

> City of Los Angeles
Departments of City Planning, Community Redevelopment, Public Works (Bureau of Engineering) and Transportation

> County of Los Angeles

> Department of Public Works

> Elected Official Briefings
Local, state and federal

MEETING TYPE	MEETING	STATUS
Meetings Required by CEQA/NEPA	Formal Scoping Meetings Public Hearings	Completed May 2009 Summer 2010
Periodic Updates	Community Meetings	At least one round of update meetings in November 2009; additional round of meetings in Spring 2010
Focused Meetings	Urban Design Working Group Little Tokyo Working Group	May 2009 – ongoing September 2009 - ongoing
Ongoing Meetings/Briefings	Multiple meetings with individual stakeholder groups	As needed/requested

in the news

TAMING THE TORO: Japanese novice bullfighter Tara Nono makes a pass during a bullfight in Torremolinos, southern Spain on Sunday. Tara moved closer to achieving his goal of becoming his country's first full-fledged professional matador by taking part in his first bullfight involving mounted lancers.

japan-at-a-glance

GRIM STATISTIC: The rise of Japan's suicide rate is accelerating towards record levels, with the number of suicides in June alone totaling 2,822. The total number of suicides during the first half of 2009 was 17,076, up by 768 compared to the same period last year, with males accounting for about 75 percent of that figure. The continuing recession is believed to be partly to blame.

what's happening?

DRUM LINE: L.A. Matsui Taiko will take part in Taiko 10, a free concert to be held in the Noguchi Plaza of the Japanese American Cultural & Community Center in Little Tokyo this Friday at 7:30 p.m. The concept for this event draws from the group presentation sessions that have been held during the early Taiko Conferences and hopes to demonstrate the diversity of taiko styles that have developed across North America.

DOLLAR DOWN: The dollar closed lower on the Tokyo foreign exchange market Tuesday, sinking 0.02 yen to finish at 94.97 yen.

North Korea Pardons Journalists

Special pardon is ordered following negotiations with Bill Clinton.

ASSOCIATED PRESS

Laura Ling, left, and Euna Lee have been held by North Korea since March when they were accused of sneaking into the country illegally.

Former President Bill Clinton, seated left, meets with North Korean leader Kim Jong Il, seated right, in Pyonggyang on Tuesday.

SEOUL, South Korea – North Korean leader Kim Jong Il issued a "special pardon" for two jailed American journalists and ordered their release at former President Bill Clinton's request, North Korean media reported Wednesday.

The move to free reporters Laura Ling and Euna Lee reflected North Korea's "humanitarian and peaceloving policy," the Korean Central News Agency said in a dispatch from Pyongyang early Wednesday.

Clinton spokesman said the former president and the two journalists departed North Korea en route to Los Angeles.

On their Web site, the families of Ling and Lee expressed joy and gratitude at the news that their loved ones were to be released.

"The families of Laura Ling and Euna Lee are overjoyed by the news of their pardon. We are so grateful to our government, President Obama, Secretary Clinton and the U.S. State Department for their dedication to and hard work on behalf of American citizens," the statement read.

Clinton landed in the North Korean capital on Tuesday on a private mission to negotiate the freedom of the two women working for former Vice President Al Gore's Current TV media venture.

During his visit, he held rare talks with Kim — the reclusive North Korean leader's first meeting with a prominent Western figure since reportedly suffering a stroke a year ago.

Lee, 36, and Ling, 32, were arrested in March after crossing into North Korea from China, where they had been reporting on North Korean defectors. They were sentenced to 12 years of hard labor for illegal entry and engaging in "hostile acts."

Washington had pushed for their release, with Clinton's wife, Secretary of State Hillary Rodham Clinton, requesting last month that they be granted amnesty. She described the women as remorseful, and expressed their families' anguish.

Lee, a South Korean-born U.S. citizen, is married and has a 4-year-old daughter in Los Angeles; a native Californian, Ling is the married younger sister of TV journalist Lisa Ling.

State media said Clinton offered Kim "words of sincere apology" for the women's transgressions, and "courteously" conveyed President Barack Obama's gratitude for North Korea's leniency, KCNA said.

White House spokesman Robert Gibbs, however, denied Clinton went with a message from Obama. "That's not true," he told reporters in Washington.

Clinton's landmark visit, which was not announced in advance by North Korea or the U.S., comes at a time of heightened tensions between Washington and Pyongyang, foes during the Korean War of the 1950s, over the regime's nuclear program.

North Korea in recent months has conducted a nuclear test and test-fired an array of ballistic mis-

Furutani, Hayashi Assume Helm of Legislative Caucus

SACRAMENTO – The Asian Pacific Islander (API) Legislative Caucus elected Assemblymember Warren T. Furutani (D-South L.A. County) and Assemblymember Mary Hayashi (D-Hayward) to serve as the new chair and vice chair, respectively, starting Sept. 11. The API Legislative Caucus was established in 2001 with the mission of representing and advocating for the interests of the diverse API communities of California. Additionally, the caucus seeks to increase API participation and representation in all levels of government.

Furutani

Hayashi

"I look forward to serving the API community as chair of the API Legislative Caucus," stated Assemblymember Furutani. "The caucus has played a critical role in our community under Assemblymember Lieu's stewardship, and I hope to continue the standard he has set for the Caucus and for our community."

"Assemblymembers Warren Furutani and Mary Hayashi bring an extensive history of API community work and advocacy to the API Legislative Caucus," said Assemblymember Ted Lieu (D-Torrance), who serves as the current chair of the API Legislative Caucus. "I look forward to the great work they will be making on behalf of the API community as the caucus leadership."

Elected as caucus chair in 2007, Lieu will be serving out his term until the end of the current legislative session. Under his leadership, API representation in the State Legislature reached a historic high of 11 members. He has announced his candidacy for state attorney general.

"Assemblymember Lieu has done an extraordinary job encouraging and achieving higher Asian Pacific Islander involvement," added Assemblymember Hayashi, who is the first Korean American woman to be elected to the California State Legislature. "In harnessing this activism, Assemblymember Lieu has been able to channel the diverse talents of Asian Pacific Islanders into civic engagement."

Working with the Black Legislative Caucus and the Latino Legislative Caucus, Lieu played a significant role in increasing judicial and political appointments of minorities and in securing a historic agreement with top foundations to increase funding to minority communities. Additionally, Lieu took the lead in 2008 to reverse the Ladies Professional Golf Association's proposed racist ban on women golfers who did not speak English. As chair of the API Legislative Caucus, Assemblymember Lieu worked with community partners to bring together over 330 community leaders and advocates to the API Policy Summit.

Metro Regional Connector Meeting Tonight

A meeting will be held on Wednesday, Aug. 5 with the Metro Regional Connector Light Rail Transit Team to discuss issues specific to the Little Tokyo area from 4:30 to 6:30 p.m. at the Japanese American National Museum.

The Metro team will present 3-D models of the intersection of First and Alameda, and will answer questions and concerns for the four alternatives for the Regional Connector that is being planned to travel through Little Tokyo. Metro will also discuss potential construction activities and also present a sample of the construction mitigation process used during the Gold Line East Extension.

Metro wants to provide seamless travel for riders from all parts of Los Angeles County through Little Tokyo by providing service between existing Metro Blue and Gold Lines and the future Gold Line Eastside Extension and the Expo Line, which is slated to be operational in 2009 and 2010 respectively.

OCJAA Scholarships Now Available

The Orange County Japanese American Association is now accepting applications for the eighth annual Japanese Cultural Scholarships. The scholarship, donated to OCJAA by the late Koichi and Toyo Nerio, aims to encourage young men and women of Japanese ancestry who are in training to acquire Japanese cultural skills such as flower arrangement, tea ceremony, calligraphy, Japanese dance, Ryukyu dance, manyo folk songs, folk dance, taiko, judo, kendo and karate, to continue their studies in the future.

OCJAA is offering up to five scholarships of $750 each to those who meet the following qualifications:

• OCJAA members, children/grandchildren of OCJAA members or any persons of Japanese ancestry who are ages between 19 and 40 and are residing in Orange County or taking Japanese cultural lessons in Orange County, and

• who have been and are currently in training to acquire Japanese cultural skills and plan to continue training in the future.

• Children/grandchildren of current OCJAA members residing outside Orange County may also apply if the parents/grandparents had paid membership dues for three years or more.

Selected students are required to attend the OCJAA Senior Citizens Appreciation Day on Sunday, Oct. 11. Application forms are available by calling the OCJAA office at (714) 283-3551. The deadline for submission is Tuesday, Sept. 15.

Toyota Quarterly Losses at $819 Mill

ASSOCIATED PRESS

TOKYO – Booming sales of the Prius hybrid helped the world's No. 1 automaker Toyota deliver a smaller-than-expected $819 million quarterly loss and narrow its forecast of red ink for the full year.

The Japanese carmaker, whose models include the Corolla subcompact and luxury Lexus, said Tuesday it expects a $4.7 billion loss for the fiscal year through March 2010, better than the 550 billion yen loss initially projected.

The results for the April-June quarter showed that Toyota Motor Corp. is getting some traction from aggressive cost-cutting and Japanese government incentives that have boosted sales of green cars like the Prius. Analysts surveyed by Thomson Reuters had forecast a fiscal first quarter loss of 210 billion yen.

Toyota, which dethroned General Motors Corp. as the world's top selling automaker in 2008, raised its global vehicle sales forecast for the fiscal year by 100,000 to 6.6 million vehicles. The increase reflected the success of the Prius in Japan while sales forecasts for Europe and North America were unchanged.

The growing popularity of environment-friendly vehicles has given Toyota some respite from the auto meltdown. The Prius gas-electric hybrid has been the top-selling model in Japan for two months straight, the first time a hybrid clinched that spot, and is reportedly on track to take that spot again for July. Toyota says it has received 345,000 orders for the Prius in Japan since it went on sale in May.

Toyota sold 1.4 million vehicles worldwide during the quarter, a decrease of 785,000 from a year earlier.

A Grand Dance Finale

The Gardena Buddhist Church obon marked the end of Southern California's obon season last weekend. An estimated 1,000 to 1,300 dancers lined the closed off street on Saturday alone. Clockwise from above, Arlene Miya, far right, obon chairperson for this year's festival, leads dancers by example. At left, church members Brent Sasaki, and Bob Harada man the hot grill to feed the thousands in attendance. At right, carnivalgoers of all ages enjoy a good game of coin toss.

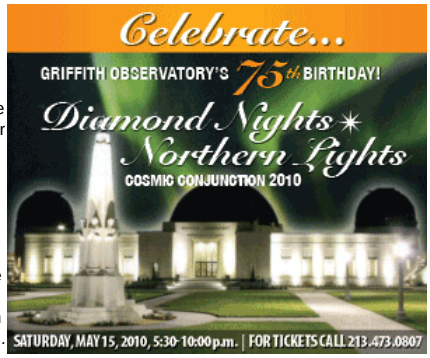
Regional Connector Meetings Ahead

Metro Planning Four Sessions to Cover Underground Alternative Starting April 9

by Ryan Vaillancourt, Staff Writer

Published: Wednesday, March 31, 2010 1:37 PM PDT



Celebrate...
GRIFFITH OBSERVATORY'S 75th BIRTHDAY!

COSMIC CONJUNCTION 2010
SATURDAY, MAY 15, 2010, 5:30-10:00 p.m. | FOR TICKETS CALL 213.473.0807

DOWNTOWN LOS ANGELES –Metro is inviting community members to learn more about the underground alternative for the proposed Downtown regional connector at a series of upcoming meetings, the first happening on April 9 (noon-1:30 p.m.) at the Central Library at 630 W. Fifth St.

The sessions will include presentations highlighting the features of the new build alternative, as well as comparisons with the other options being considered.

The regional connector is a proposed two-mile transit link that would connect the Metro Gold and Blue lines. In February, the Metro board voted unanimously to authorize staff to study a new, third build alternative for the proposed Downtown regional connector, placing the infrastructure entirely underground in Little Tokyo.

The other meetings are scheduled as follows: 6:30-8 p.m. on April 13 at Lake Avenue Church, Pasadena, 393 N. Lake Ave.; 2-3:30 p.m. and 6:30-8 p.m. on April 14 at the Japanese American National Museum, 369 E. First St.; and from 11 a.m.-1:30 p.m. on April 17 at the Los Angeles Theater Center, 514 S. Spring St.

For more information, visit metro.net/regionalconnector or email regionalconnector@metro.net.

Regional Connector Transit Corridor Project DEIS/DEIR Community Update

Wurlitzer Building
Saturday, November 7, 2009

Metro

Project Progress

- In January 2009, Metro Board of Directors approved alternatives for further study in a Draft Environmental Impact Statement/ Draft Environmental Impact Report (DEIS/DEIR)

- DEIS/DEIR effort commenced with Scoping Meetings

- Scoping period ended May 11, 2009
  - Four Scoping Meetings
  - 175 attended
  - 82 comments received at meetings
  - 44 additional comments received during the scoping process

What we heard

- The community supports the need to increase system connectivity.
- There is support for grade-separated LRT connecting the 7th/Metro Center to the Little Tokyo Arts District Station.
- The environmental and quality of life impacts by the construction and operations of the project.
- Steps must be taken by Metro to identify, and look for ways to minimize and mitigate these impacts.

Additional Stakeholder Meetings

- Bringing Back Broadway
- Central City East
- Go For Broke
- Japanese American Cultural and Community Center
- Japanese American National Museum (2 meetings)
- Japanese Chamber of Commerce of Southern California
- Little Tokyo CRA CAC
- Little Tokyo Community Council (7 meetings)
- Little Tokyo Service Center (2 meetings)
- Los Angeles Conservancy
- MOCA
- Savoy Homeowners Association
- Thomas Properties Group
- University of Southern California
- Urban Design Working Group

Metro

Little Tokyo Working Group

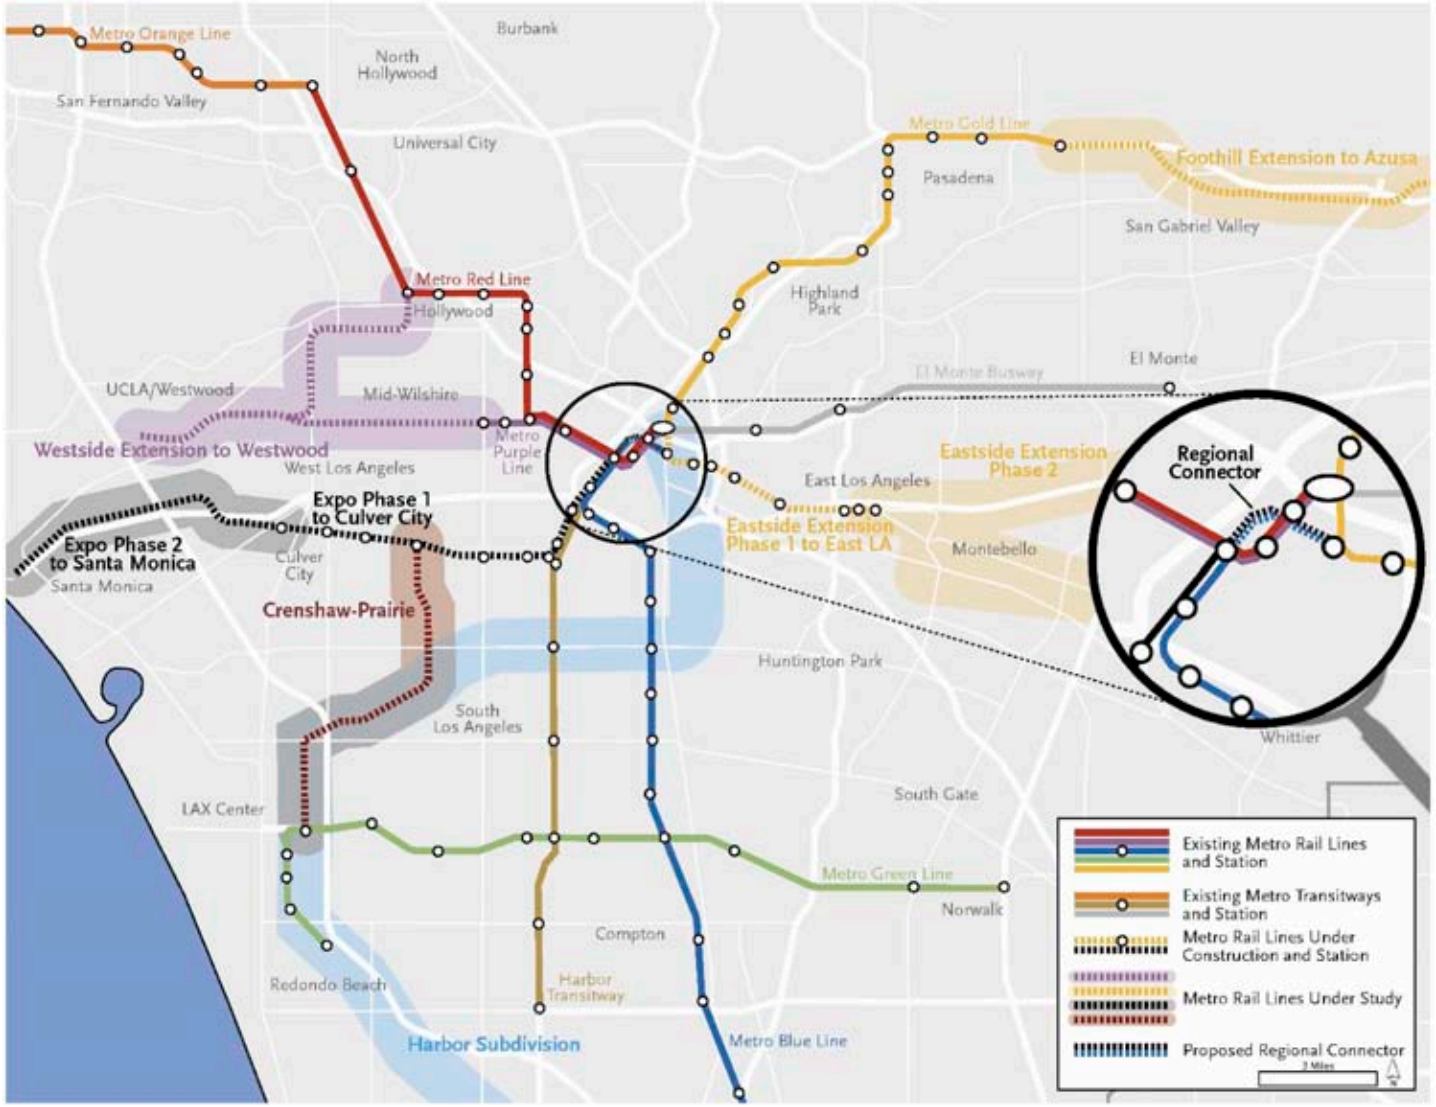
- Supporting Little Tokyo Community Council
- Review and discuss the 4 alternatives
- 3 meetings have taken place
  - Discussed at-grade impacts and potential mitigations
- Remaining meetings to discuss impacts and potential mitigations of the TSM, No-Build and Below-Grade Emphasis alternatives

Metro

System Overview

Metro approved the Long Range Transportation Plan, October 2009

- Regional Connector
- Westside Extension
- Eastside Extension Phase 2
- Crenshaw-Prairie



Metro

Purpose & Need

- LA County Population Growth – Almost 2 million additional people by 2035
- Downtown Los Angeles is the largest employment center
- 5.7 million person-hours of daily delay
- Transfers at Union Station and 7th Metro can add up to 20 additional minutes to a trip
- Payment of transfers adds costs to riders

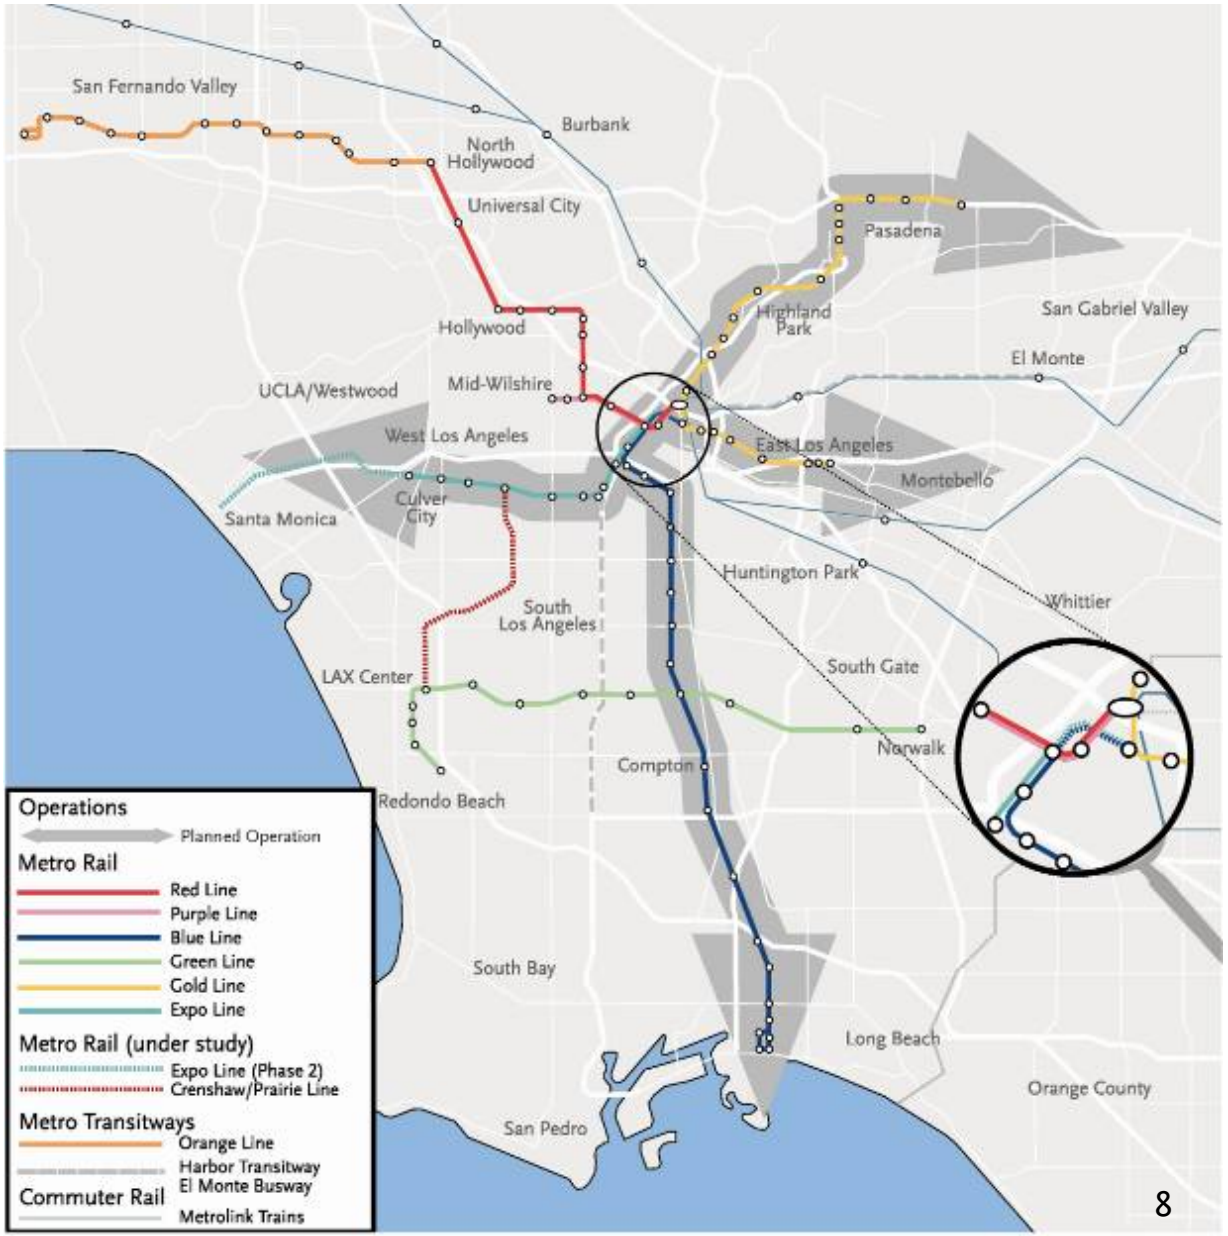
Metro

Project Overview

- **Connect the Metro Gold Line (Pasadena & Eastside), Metro Expo Line, and Metro Blue Line.**

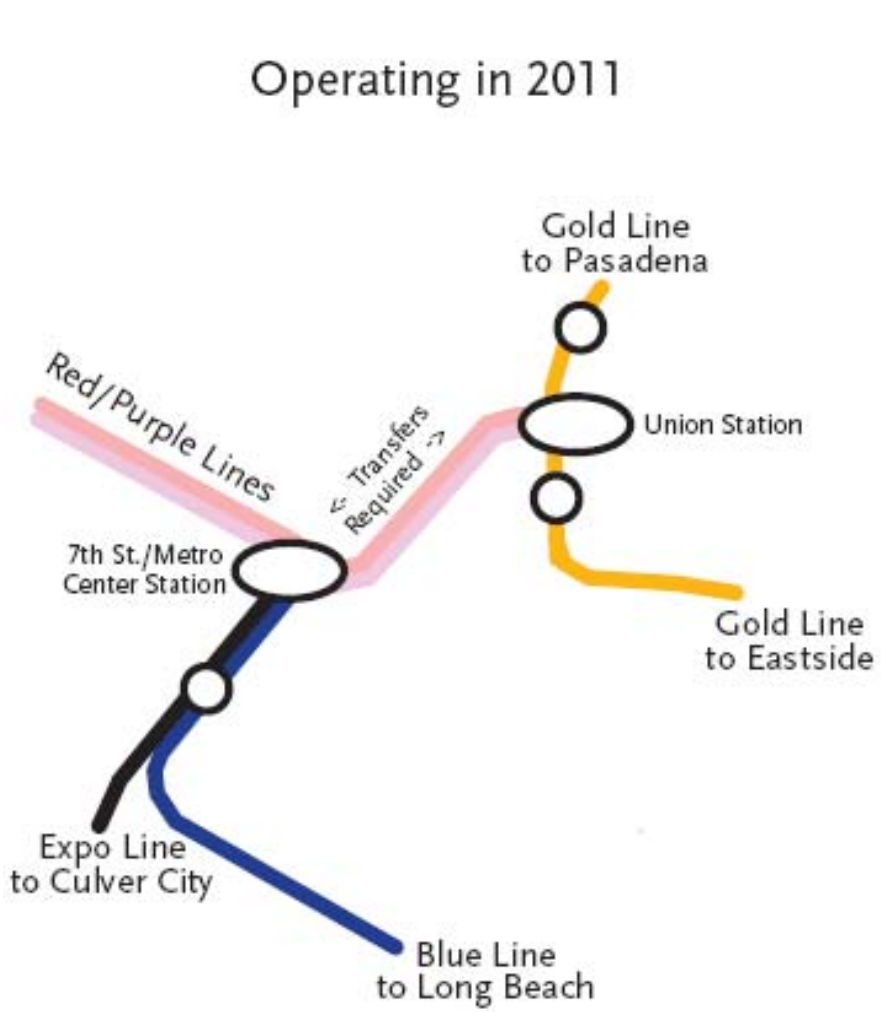
- **Provides a "One Seat Ride" for travel across the county on light rail.**

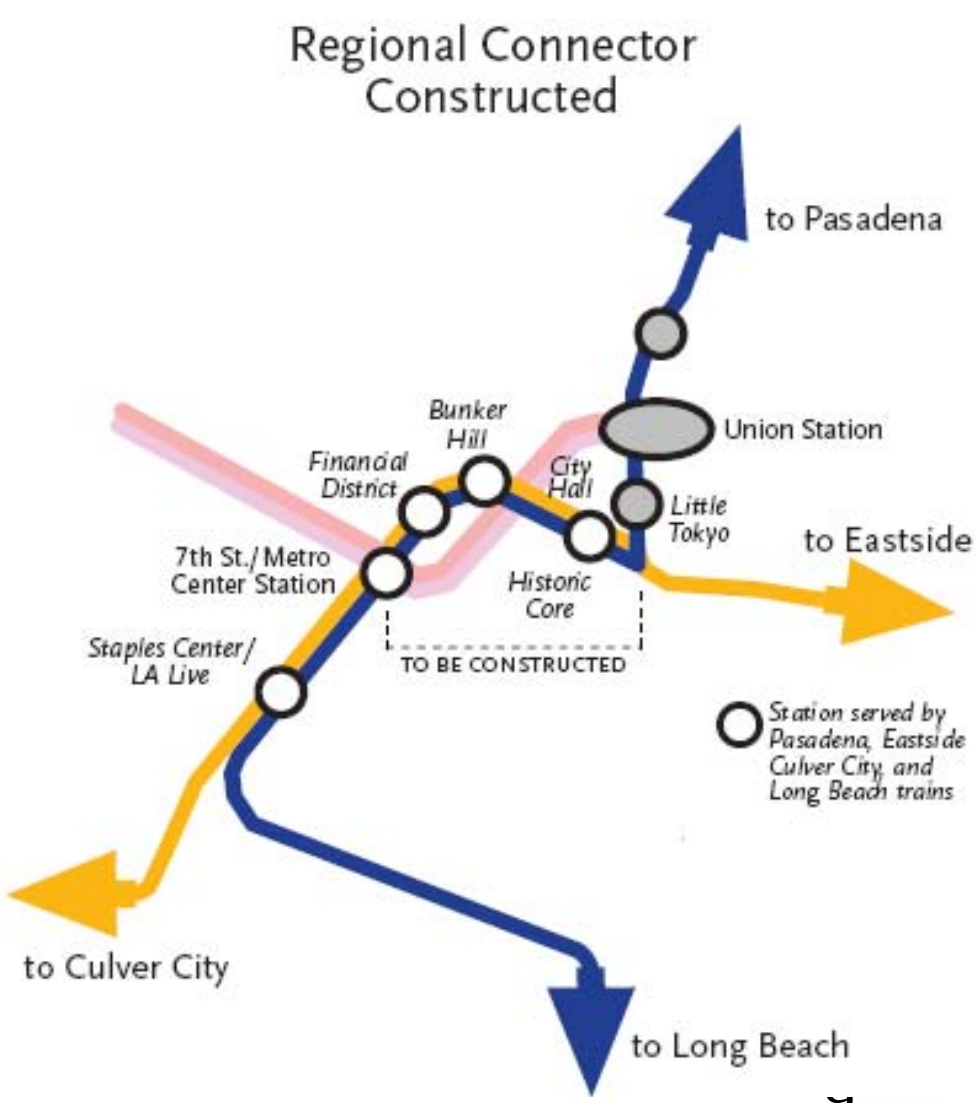
- **Provides for a sustainable mode of transportation, saving people time and money.**



Metro

Project Overview





Project Overview

- Daily Project Trips - approx. 68,000
- Combined Daily Boardings at three new Regional Connector Stations – 15,140
- Approximately 17,000 & 6,000 fewer boardings at Union Station and 7th Street/Metro Center Station

Project Overview

TRAVEL TIMES

	No-Build*	TSM (via Bus)*	At-Grade Alt.	Underground Alt.
Pomona/Atlantic to Exposition/ USC	44 mins	52 mins	36 mins	31 mins or 30% improvement
Pico to Memorial Park	39 mins	47 mins	36 mins	34 mins or 12.8 % improvement
Washington/ National to 2nd Street	34 mins (to Civic Center)	38 mins	33 mins (to 1st/ Los Angeles)	30 mins or 28% improvement

Regional Connector Draft EIS/R Project

Community Update Meetings

Save the Date

Metro is currently developing a Draft Environmental Impact Study and Report (Draft EIS/R) for the Regional Connector Transit Corridor project. This project is studying transportation alternatives to connect the Blue Line to the Gold Line, thereby expanding Metro's LRT system, relieving station congestion, and improving transit times. The study began in Spring 2009 with formal Public Scoping meetings to provide the public an opportunity comment as the project proceeds into in-depth analysis of the alternatives. Since then, Metro has been reviewing community feedback received at these meetings, conducting ongoing technical study and analysis, as well as meeting with stakeholders on a regular basis.

The purpose of the upcoming community update meetings is to provide the public with an update on the status of the project, discuss what we heard at the scoping and stakeholder meetings, and to present the findings of the technical studies to date.

Thursday, November 5, 2009; 6:30 p.m. to 8 p.m.
Lake Avenue Church
393 N Lake Ave, Pasadena

Saturday, November 7, 2009; 10 a.m. to Noon
Wurlitzer Building

Tuesday, November 10, 2009; Noon to 1:30 p.m.
Board Room, Los Angeles Central Library
630 W 5th St, Los Angeles

Thursday November 12, 2009; 2 p.m. to 3:30 p.m. AND 6:30 p.m. to 8 p.m.
Japanese American National Museum (JANM)
369 E 1st St, Los Angeles

Identical information will be presented at each meeting. Please plan to attend the meeting that best accommodates your schedule.

For additional information or questions, please visit the Regional Connector Transit Corridor study website at metro.net/regionalconnector or contact the project information line at 213.922.7277. The project is also on Facebook, under Regional Connector Transit Corridor Study.

Thank you for your continued involvement in planning the Regional Connector – a light rail connection through Downtown Los Angeles that will provide mobility benefits to the entire region.

The Regional Connector Transit Corridor Draft Environmental Impact Statement/Report (DEIS/R) is examining potential alternatives to create a Light Rail Transit (LRT) link between the existing Gold and Blue Line systems, the Gold Line Eastside Extension and the Exposition Line. Once completed, transit riders would enjoy increased transit connections throughout the entire LRT system. The DEIS/R includes the review of the possible effects of the project and alternatives on the project study area.

Gracias por su continua participación en la planificación del Conector Regional – una conexión de tren ligero a través del Centro de Los Angeles que proporcionará beneficios de movilidad a la región entera.

El Borrador de la Declaración/Reporte de Impacto Ambiental (DEIS/R) del Corredor de Transporte Conector Regional está examinando alternativas potenciales para crear un enlace de transporte de tren ligero (LRT) entre los sistemas existentes de Metro Gold Line y Metro Blue Line, la Extensión hacia el Este de la Línea de Oro y Exposition Line. Una vez completado, los usuarios disfrutarían de más conexiones de transporte a través del sistema LRT. El DEIS/R incluye la revisión de los posibles efectos del proyecto y alternativas en el área de estudio del proyecto.

369 E 1st St, Los Angeles

El contenido presentado en cada una de las reuniones será idéntico. Se puede llegar a todas las reuniones usando transporte público.

Requerimientos ADA: Comodidades especiales están disponibles para el público asistente a las reuniones patrocinadas por Metro. Peticiones para adaptaciones razonables deben ser sometidas por lo menos 3 días laborables (72 horas) antes de la fecha programada para la reunión. Por favor llame a la línea de información sobre el proyecto al 213.922.7277. Nuestra línea TDD es 800.252.9040.

Metro y la administración de tránsito federal (FTA) estarán preparando un documento en conjunto que cumple con los requerimientos de la ley de política ambiental nacional (NEPA) y la ley de calidad ambiental de California (CEQA).

Thank you for your continued involvement in planning the Regional Connector – a light rail connection through Downtown Los Angeles that will provide mobility benefits to the entire region.

The Regional Connector Transit Corridor Draft Environmental Impact Statement/Report (DEIS/R) is examining potential alternatives to create a Light Rail Transit link between the existing Gold and Blue Line systems, the Gold Line Eastside Extension and the Exposition Line. Once completed, transit riders would enjoy increased transit connections throughout the entire system. The DEIS/R includes the review of the possible effects of the project and alternatives on the project study area.

JAPANESE

You are invited to attend a community meeting to update you on Metro's progress with this project.

In March and April, Metro held four Scoping Meetings to obtain public input as part of the DEIS/R. Based on feedback you provided during the scoping process and more detailed technical study, Metro would now like to share some of the results of our ongoing analysis.

For additional information on the Regional Connector, please visit our project website at *metro.net/regionalconnector* or call the project information line at 213.922.7277.

Ayúdenos a planear el Conector Regional.

Japanese: Help us plan the Regional Connector.

10-0174CMC ©2009 LACMTA

Gracias por su continua participación en la planificación del Conector Regional – una conexión de tren ligero a través del Centro de Los Angeles que proporcionará beneficios de movilidad a la región entera.

El Borrador de la Declaración/Reporte de Impacto Ambiental (DEIS/R) del Corredor de Transporte Conector Regional está examinando alternativas potenciales para crear un enlace de transporte de tren ligero (LRT) entre los sistemas existentes de Metro Gold Line y Metro Blue Line, la Extensión hacia el Este de la Línea de Oro y Exposition Line. Una vez completado, los usuarios disfrutarían de más conexiones de transporte a través del sistema LRT. El DEIS/R incluye la revisión de los posibles efectos del proyecto y alternativas en el área de estudio del proyecto.

Thank you for your continued involvement in planning the Regional Connector – a light rail connection through Downtown Los Angeles that will provide mobility benefits to the entire region.

Metro

Regional Connector Transit Corridor

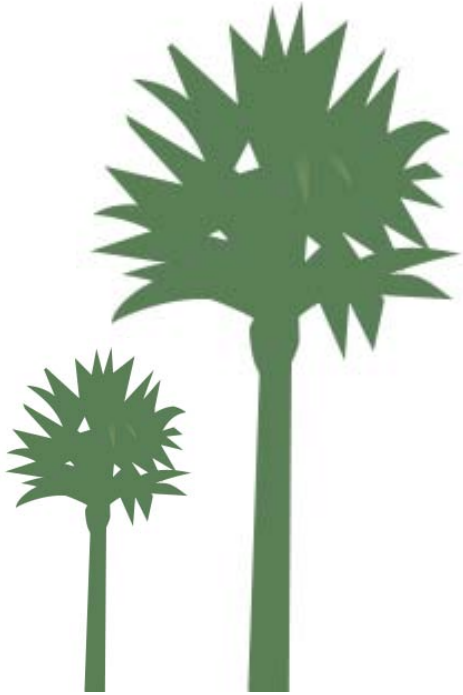
Community Update Meetings – April 2010

Metro

Today's Agenda

- Introductions
- Project Update
- What's Next?
- Stay In Touch



Metro

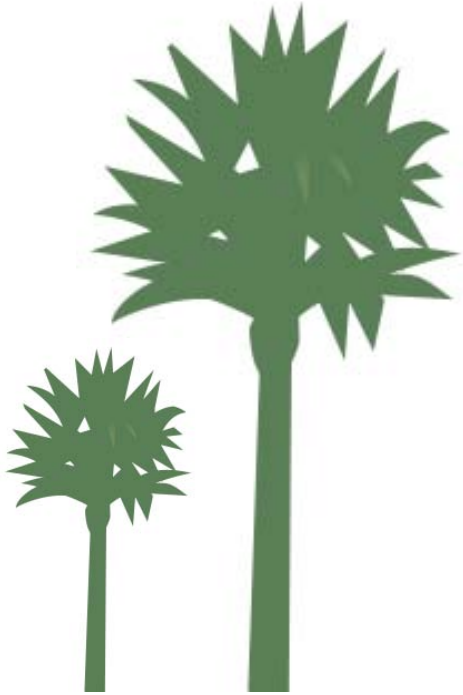
Community Update Meetings

- April 9, 12 p.m. – Los Angeles Central Public Library, Financial District
- April 13, 6:30 p.m. – Lake Avenue Church, Pasadena
- April 14, 2 p.m. – Japanese American National Museum, Little Tokyo
- April 14, 6:30 p.m. – Japanese American National Museum, Little Tokyo
- April 17, 11 a.m. – Los Angeles Theater Center

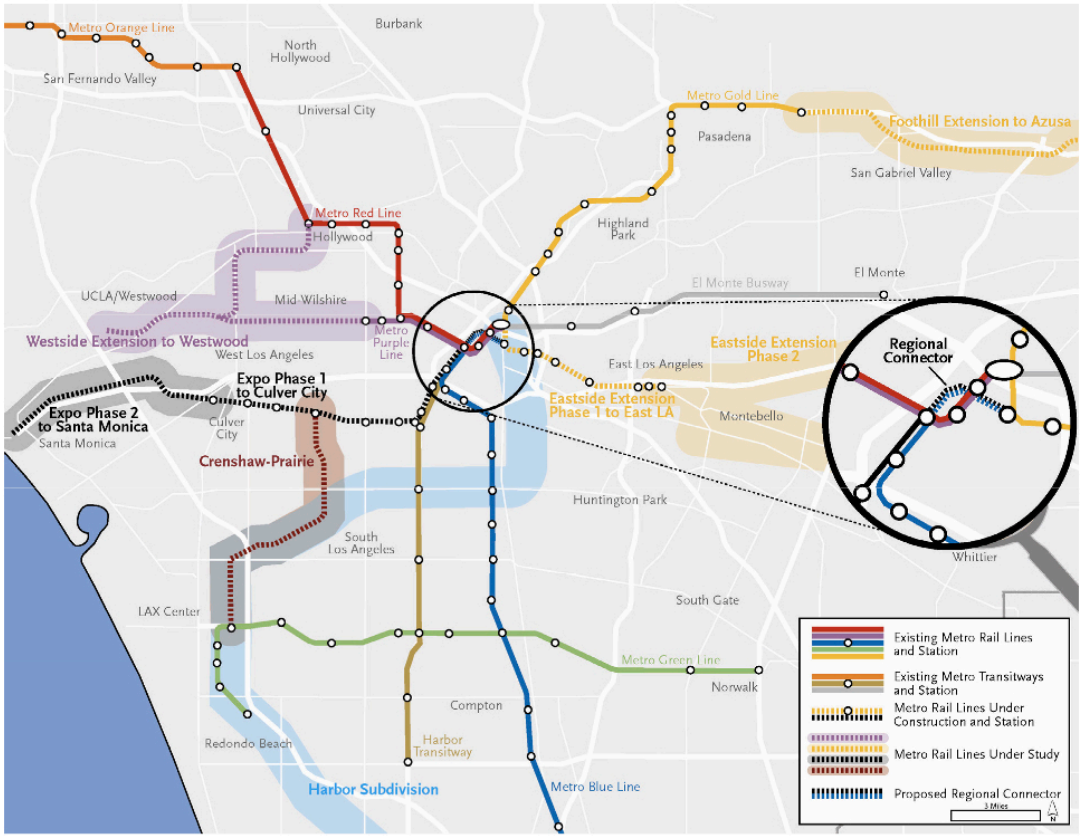


Metro

Rail System Overview

By 2035, the following corridors will have selected projects operational as funded by Measure R and other eligible local, state, and federal funds:

- Regional Connector
- Westside Extension
- Eastside Extension Phase 2
- Crenshaw-Prairie



Metro

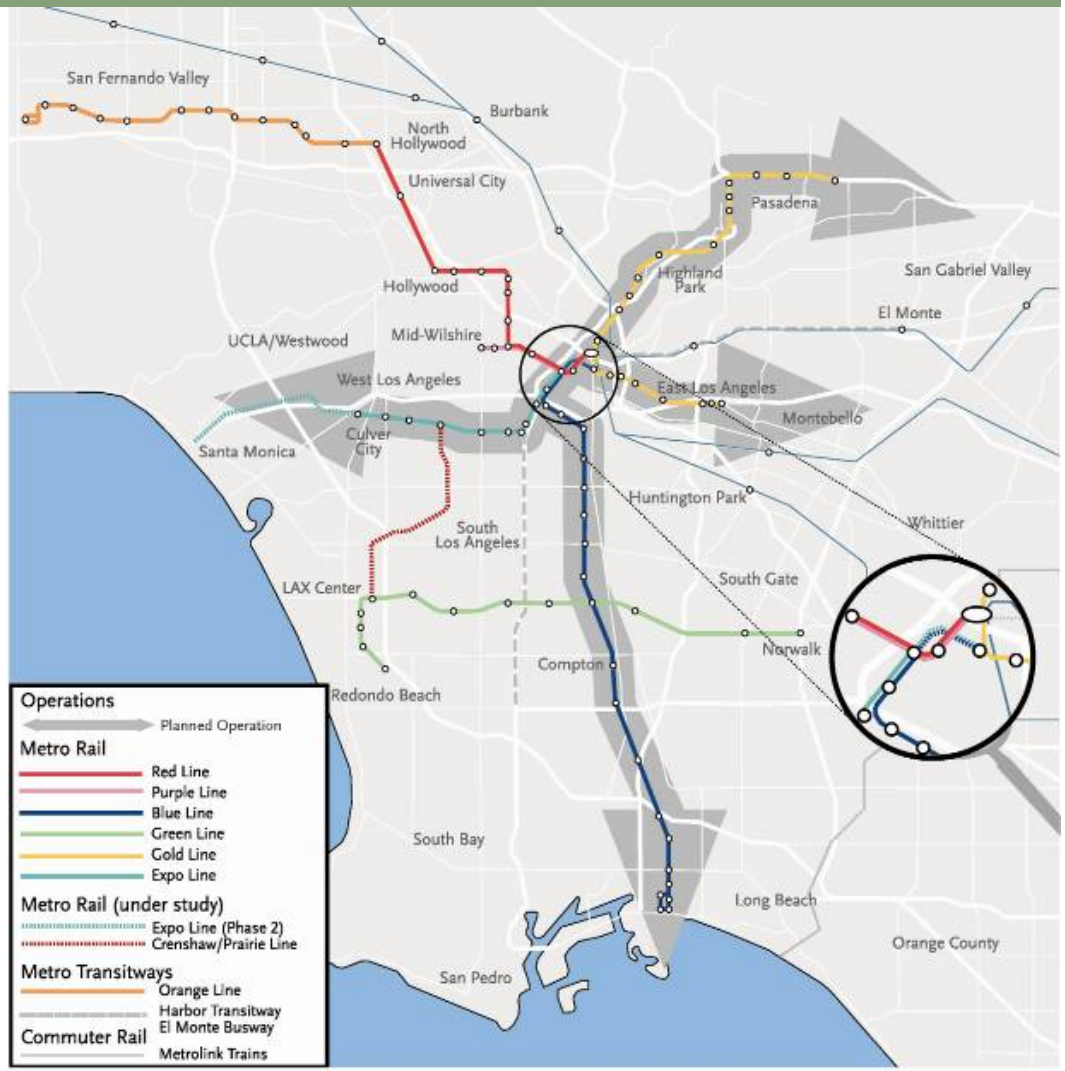
Purpose and Need

- Los Angeles County population growth: nearly 2 million additional people by 2035
- Employment density (jobs/acre projected to 2030)
  - 5th/Flower 390
  - 2nd/Hope 107
  - 2nd/Los Angeles 137
- 5.7 million persons-hours of daily delay
- Transfers at Union Station and 7th/Metro Center add up to 20 additional minutes per trip
- Payment of transfers add costs to riders

Metro

Project Overview

- Connects the Metro Gold (Pasadena and Eastside), Exposition, and Blue Lines
- Provides a "One Seat Ride" for travel across the county on light rail
- Provides for a sustainable mode of transportation, saving people time and money

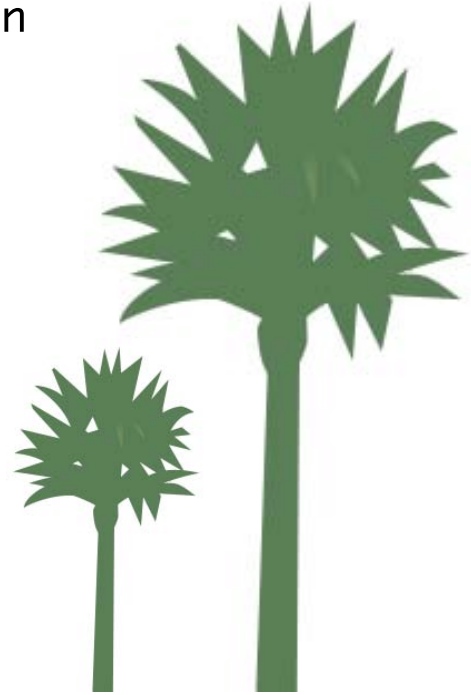


Metro

Project Benefits

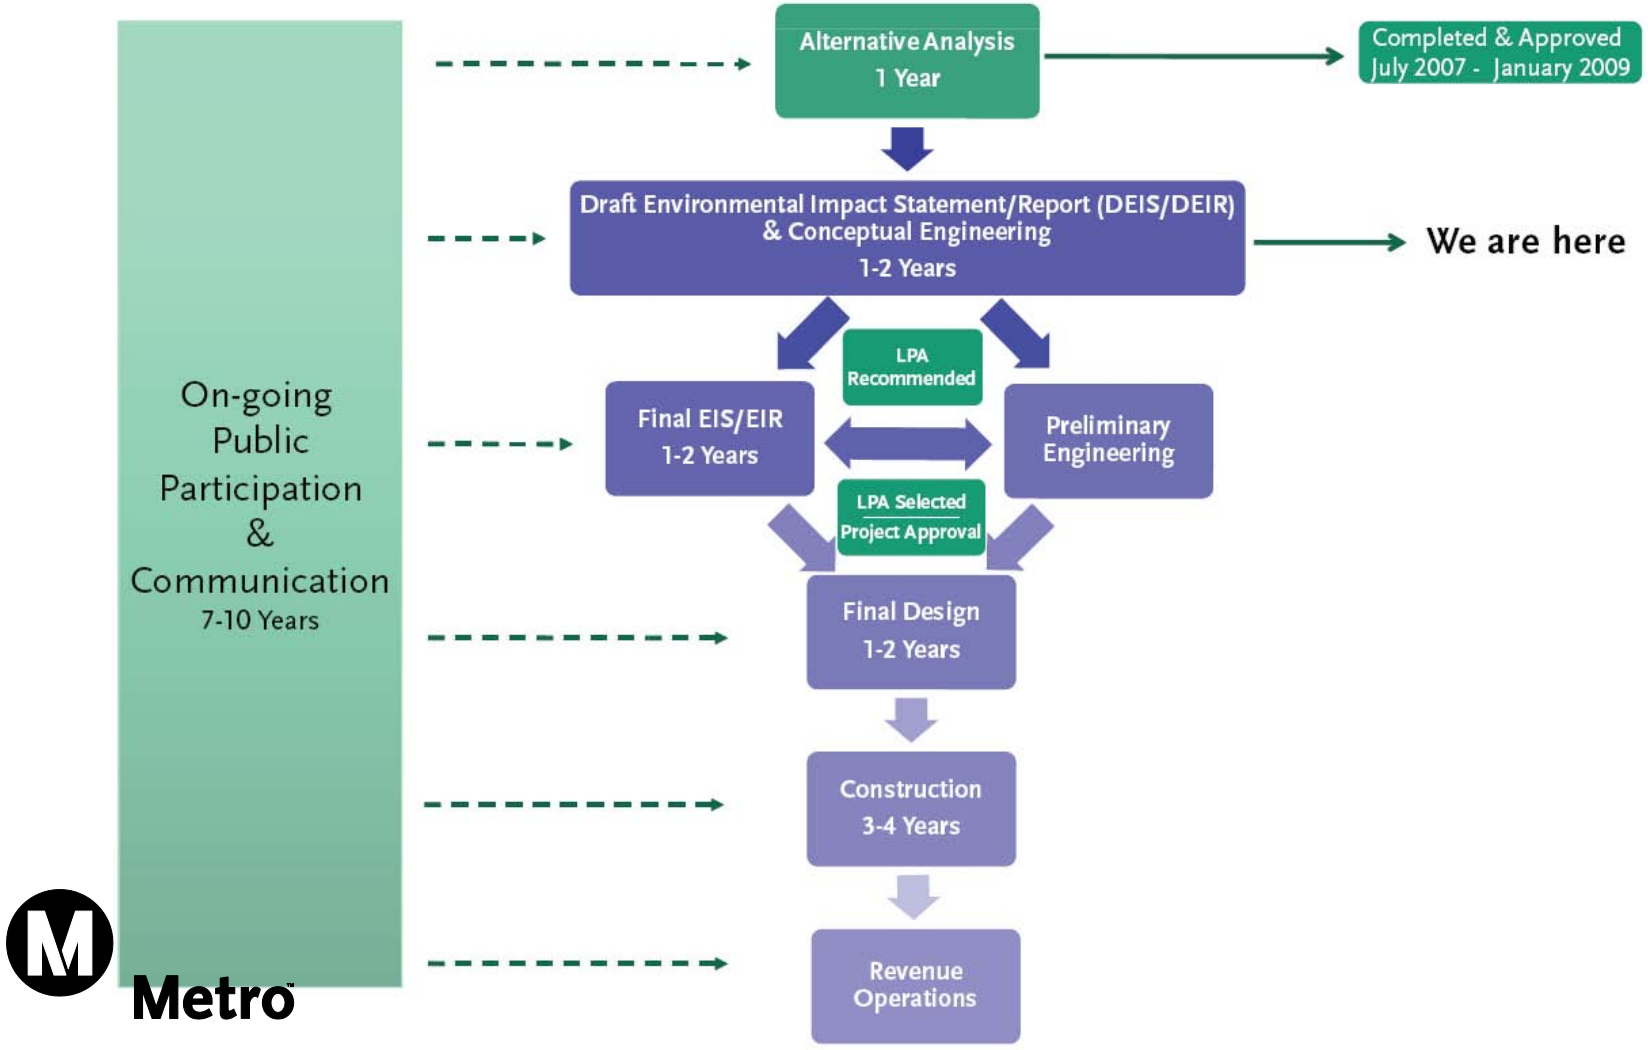
- Regional Connector creates two cross-regional lines for Los Angeles County
  - North to South LRT line (≈50 miles)
  - East to West LRT line (≈25 miles)

- Regional Connector improves ridership across the region
  - Gold Line (1st/Utah to Pomona/Atlantic) 18.4%
  - Gold Line Eastside Phase 2 11.6%
  - Gold Line (Chinatown to Sierra Madre Villa) 10.0%
  - Blue Line (Pico/Flower to Long Beach) 10.9%
  - Expo Line (Pico/Flower to Santa Monica) 4.7%



Metro

Project Development Process



Metro

Project Progress

- November 2008 – Measure R approved by voters
- January 2009 – Alternatives Analysis Study completed, Metro initiates Draft EIS/EIR Process
- May 2009 – Public Scoping period ends
- Summer/Fall 2009 – Refinement of design and continued community outreach
- Fall 2009 – Metro Board approves Long Range Transportation Plan (LRTP)
- January 2010 – Request for Proposal (RFP) for Little Tokyo Mitigation Development released
- February 2010 – Metro authorizes inclusion of a Fully Underground Alternative

Metro

Stakeholder Meetings

- Bringing Back Broadway
- Central City East Association
- Downtown Los Angeles Neighborhood Council
- Go For Broke
- Higgins Homeowners Association
- Japanese American Cultural and Community Center
- Japanese American National Museum
- Japanese Chamber of Commerce of Southern California
- Little Tokyo Business Association
- Little Tokyo CRA CAC
- Little Tokyo Community Council
- Little Tokyo Service Center
- Los Angeles Conservancy
- Los Angeles Nishi Hongwanji Temple
- MOCA
- Savoy Homeowners Association
- Thomas Properties Group
- University of Southern California

Metro

Urban Design Working Group

- Consists of stakeholders from the station areas currently under review
- Initially met as one large group, with three station area meetings
- An additional meeting will be scheduled to discuss the Little Tokyo/Arts District Station
- Expect the final UDWG meeting to take place in the summer to discuss all of the stations
- More urban design planning during the next phase of the project

Metro

Little Tokyo Working Group

- Supports Little Tokyo Community Council (LTCC)
- Gathers community input
- Reviews and discusses project alternatives included in Draft EIS/EIR
- 10 meetings have taken place to dates
  - Provided an overview of the EIS/EIR process
  - Discussed project impacts and candidate mitigations for each alternative
- Provided funding for a consultant to advise the LTCC on candidate mitigation measures specific to the Little Tokyo community

Metro

What We Heard

- > Strong support for the Fully Underground LRT Alternative
- > Locate station entrances within the “Office Depot” site and the proposed Nikkei Center development
- > Where possible, maintain businesses along Central Avenue in Little Tokyo
- > Minimize public right-of-way surface construction activities
- > Minimize environmental and quality-of-life impacts during construction
- > Continue to work with stakeholders on the development of candidate mitigation measures throughout the review of the Draft EIS/EIR and Final EIS/EIR

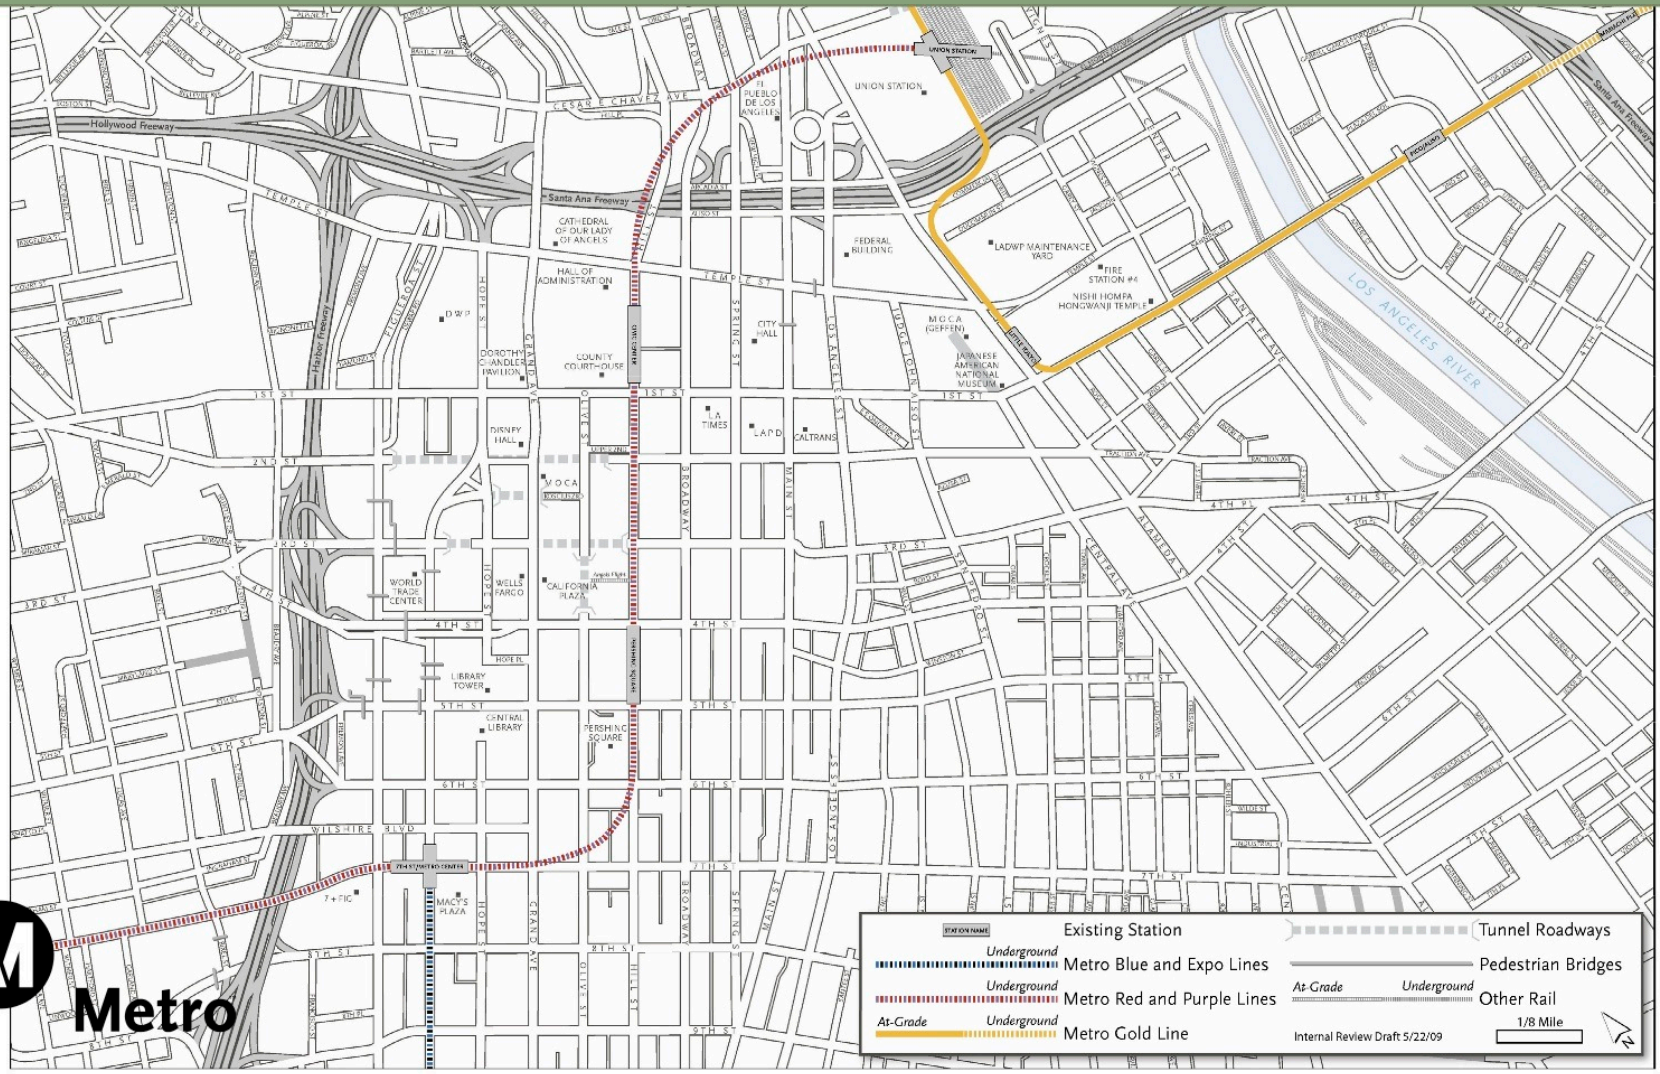
Metro

Project Alternatives Under Study

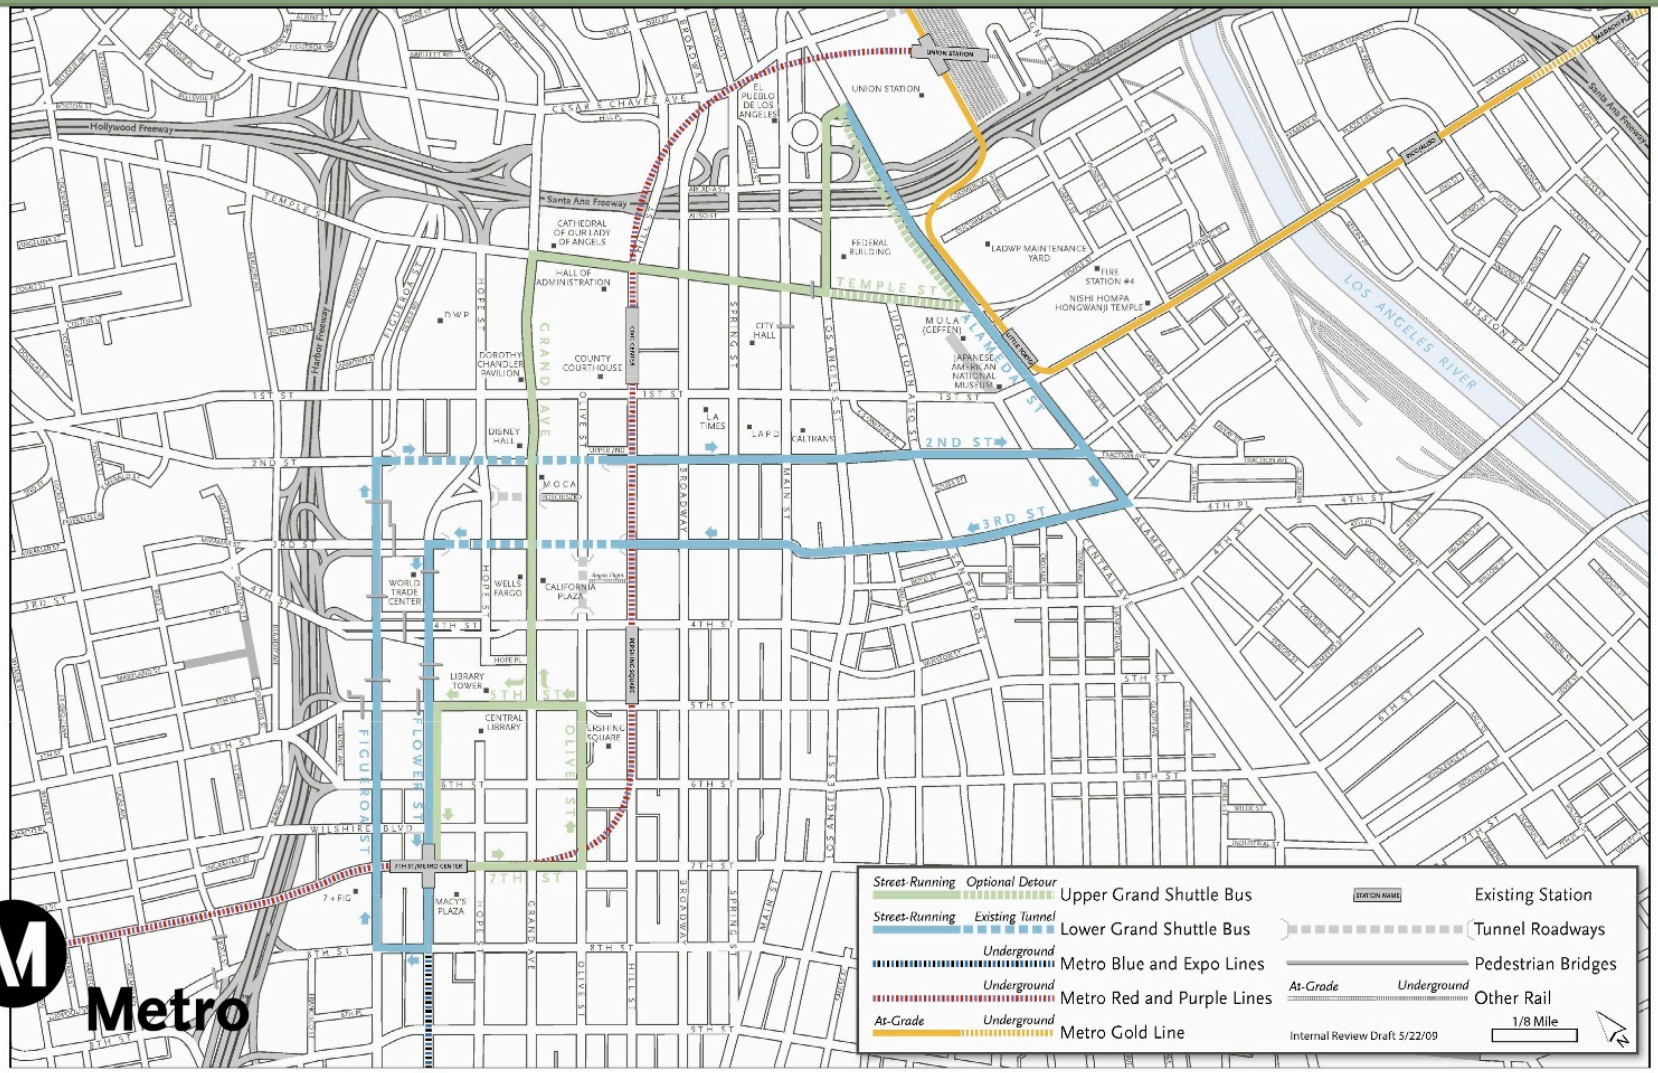
- No Build
- Transportation System Management
- At-Grade Emphasis Light Rail Transit (LRT)
- Underground Emphasis LRT
- Fully Underground LRT

Metro

Project Alternative: No Build

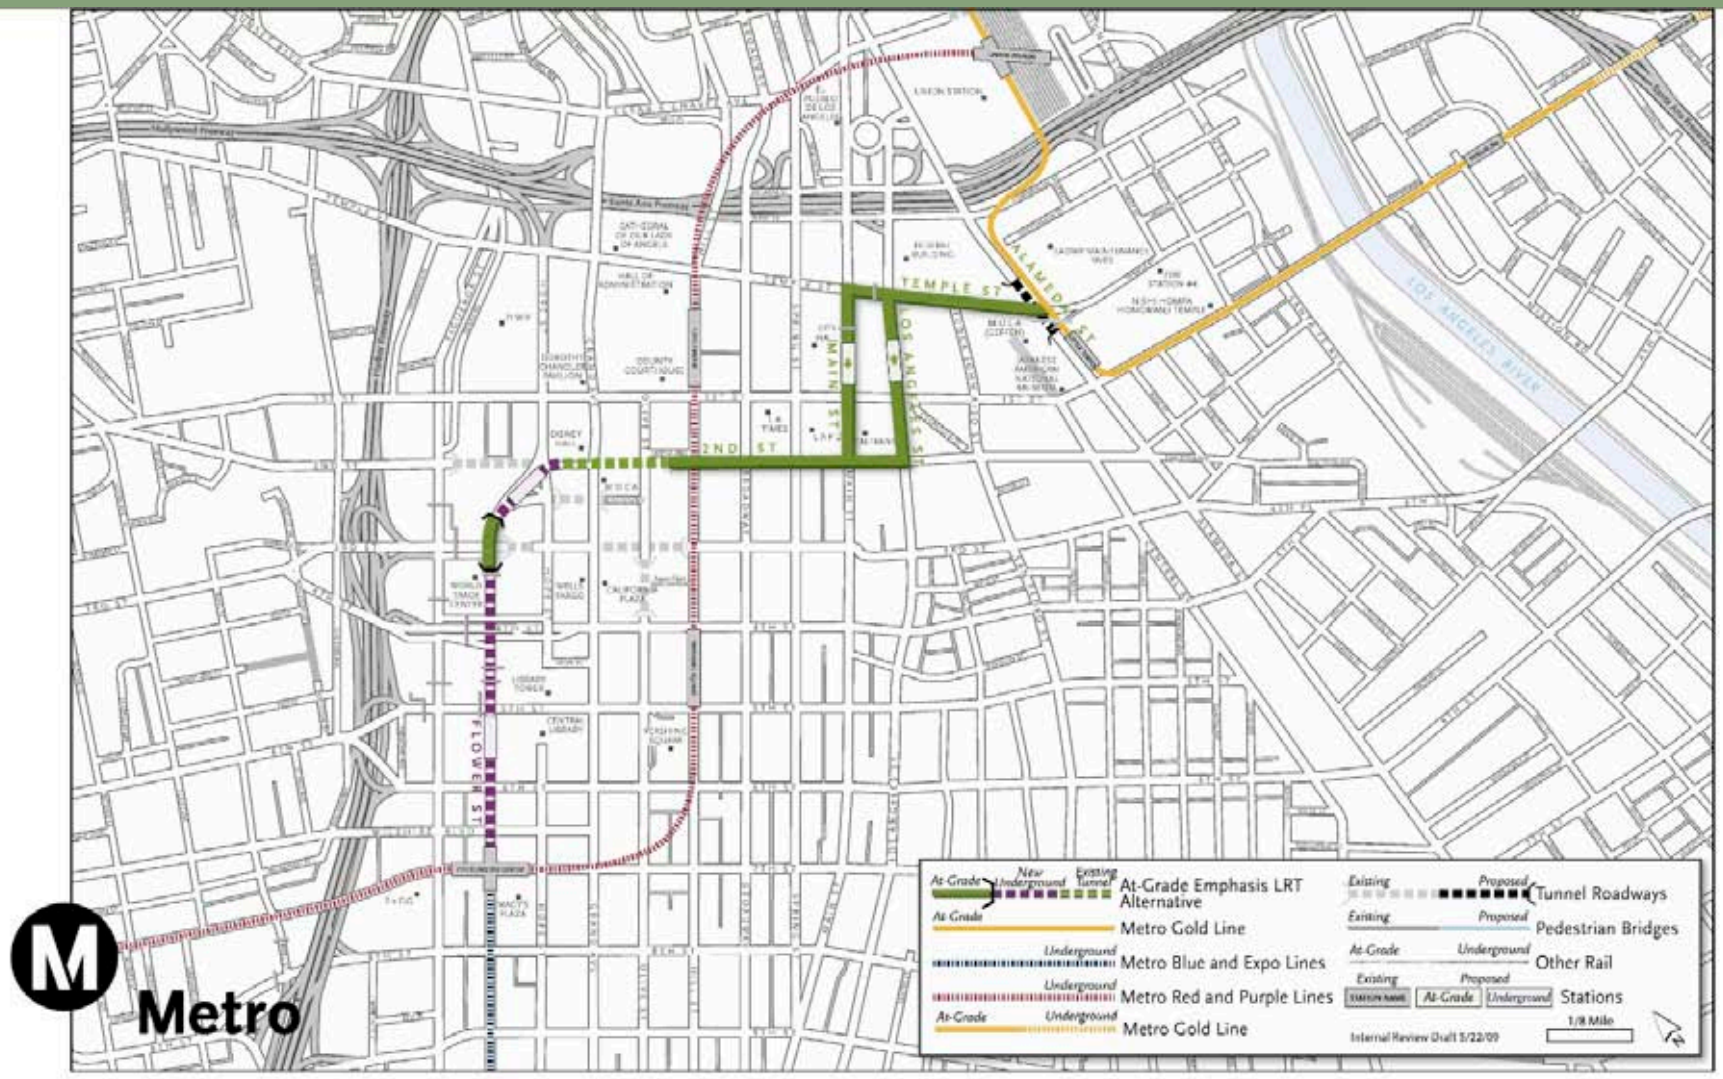


Project Alternative: Transportation System Management

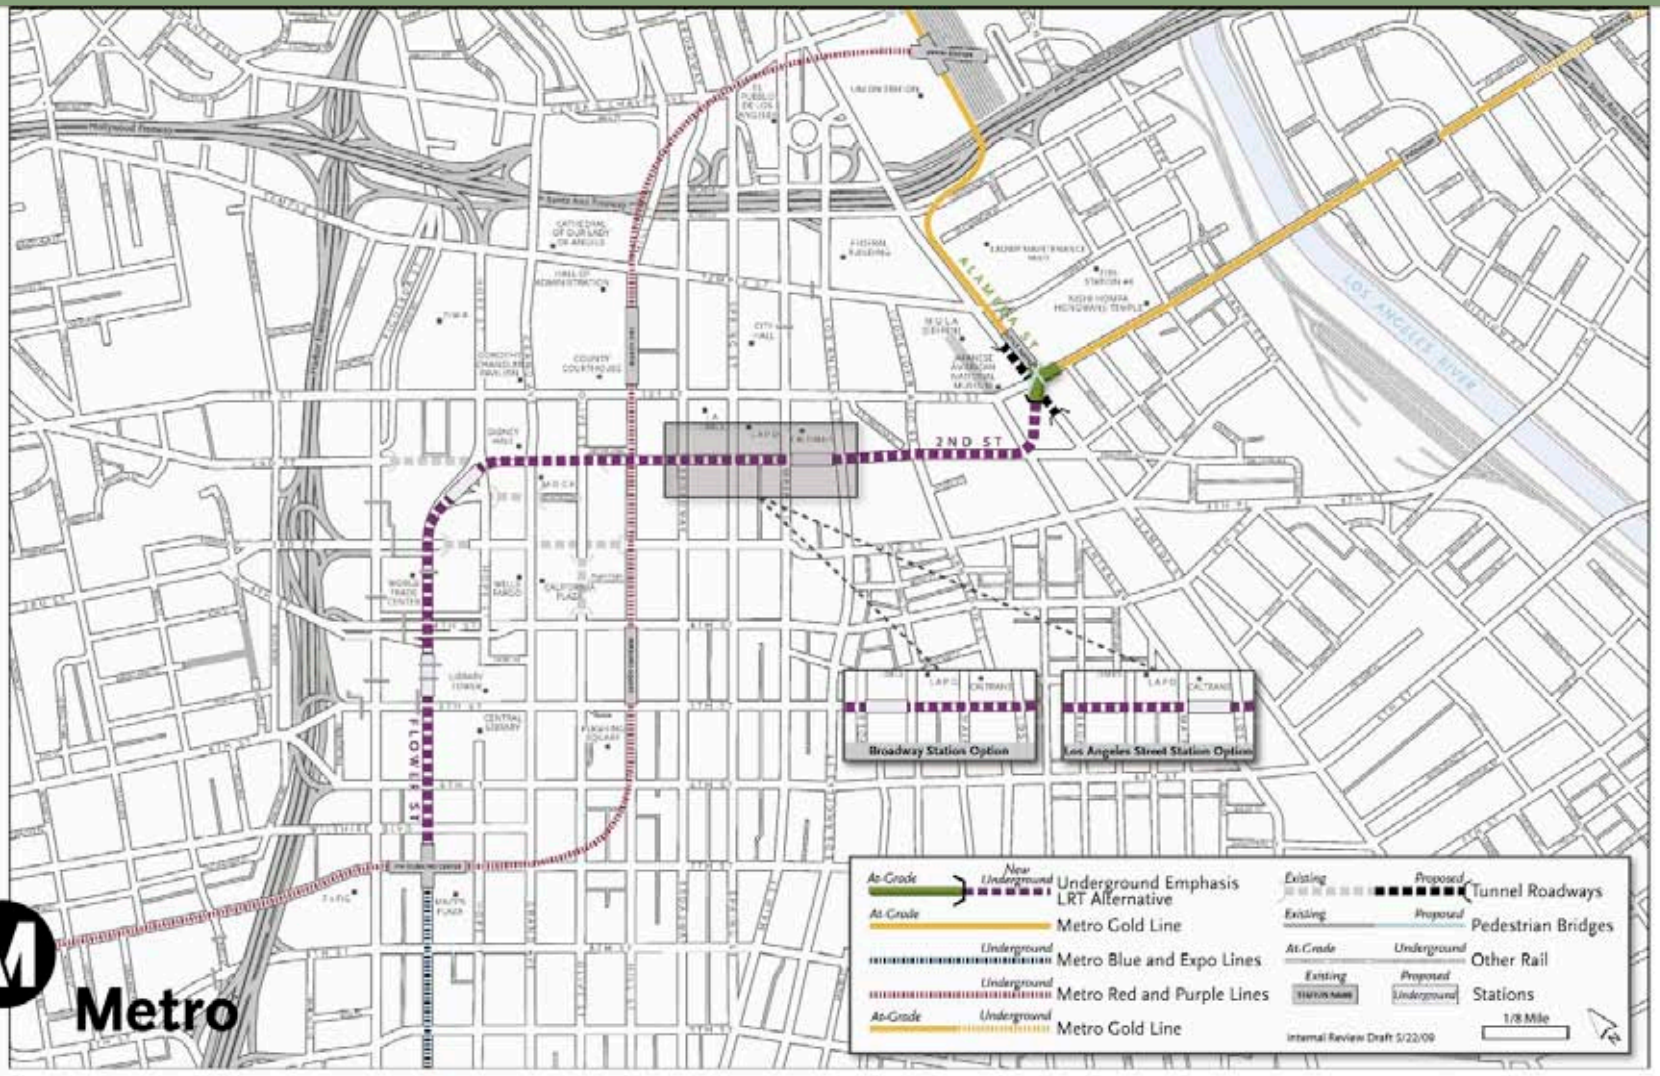


Metro

Project Alternative: At-Grade Emphasis LRT



Project Alternative: Underground Emphasis LRT



Metro

Project Alternative: Fully Underground LRT

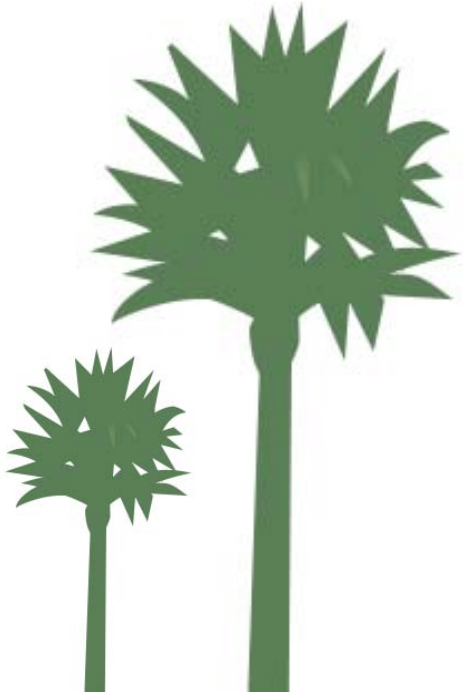
Project Alternative: Fully Underground LRT

- Tracks would pass under 1st Street at Alameda Street
- Intersection configuration remains unchanged
- Trains surface through new portals east of 1st and Alameda Streets, and northeast of Temple and Alameda Streets
- Provides a 4th underground station at 2nd Street and Central Avenue to serve the Little Tokyo and Arts District communities
- Commits to an underground station at 2nd Street at Broadway

Metro

Project Benefits

- Fully Underground LRT Alternative
  - 90,000 passengers would access the Regional Connector daily
  - 20,000+ passengers would ride LRT rather than a bus
  - 17,000 new transit riders
  - Regional Connector saves time and money
    - Reducess travel time by 30%
    - Average travel trip savings assumes 5 minutes for transfer
    - Reduce overall fare cost to riders by eliminating transfers
  - Cost effectiveness at $20.38



Metro

Project Benefits

- Compared to the No Build Alternative
  - Improves performance at up to 11 intersections
    - Including 1st and Alameda Streets
  - Reduces annual greenhouse gas emissions by up to 73,000 metric tons
  - Decreases annual highway Vehicle Miles Travelled (VMT) by 114 million vehicles miles
  - Net annual energy savings of 650 billion BTUs or equivalent to 115,000 barrels of oil

Metro

Project Benefits

> Travel Times

	No Build	TSM *	At-Grade Emphasis	Underground Emphasis	Fully Underground
Pomona/Atlantic to Expo/USC	44 minutes	52 minutes	36 minutes	31 minutes	31 minutes 30% improvement
Pico/Flower to Memorial Park	39 minutes	47 minutes	36 minutes	34 minutes	32 minutes 18% improvement
Washington/ National to 2nd Street	34 minutes to Civic Center	38 minutes	33 minutes to 1st/ Los Angeles Streets	30 minutes	30 minutes 28% improvement

Metro

*Assumes 5 minutes for each transfer

What's Next

- Community Update Meetings – Spring 2010
- Draft EIS/EIR released to public – Summer 2010
- Public Hearings – Summer 2010
- Metro Board of Directors Meeting – Fall 2010
  - Present Locally Preferred Alternative Recommendation
- Could begin Preliminary Engineering – Winter 2010
- Metro staff to refine Draft EIS/EIR based on submitted comments
- Final EIS/EIR released to public – Summer 2011

APPENDIX I

AGENCY COORDINATION AND PUBLIC INVOLVEMENT
Community Update Meeting No. 2
Meeting Announcements, Advertisements, and Notifications

State Clearinghouse Number: 2009031043

Subject: Regional Connector Announces Spring Meetings
Date: Thursday, April 1, 2010 3:09 PM
From: Ann Kerman <kermana@metro.net>
Conversation: Regional Connector Announces Spring Meetings

Greetings:

Please Join Us

You are invited to attend a community update meeting for the Regional Connector Transit Corridor Project. The meeting will consist of an open house as well as a presentation highlighting the features of the new fully underground build alternative, the benefits of the various alternatives studied and an updated schedule for completion and review of the Draft EIS/EIR.

Please mark your calendar and plan to attend one of the update meetings. (There is no need to attend multiple meetings, as identical information will be presented at each.)

Los Angeles Central Public Library, 630 W 5th St, Los Angeles
Friday, April 9th from 12 p.m. to 1:30 p.m.

This meeting is tentatively scheduled to be broadcast live from www.metro.net/regionalconnector

Lake Avenue Church, 393 N Lake Ave, Pasadena, CA
Tuesday, April 13th from 6:30 p.m. to 8 p.m.

Japanese American National Museum (JANM), 369 E 1st St, Los Angeles
Wednesday, April 14th from 2:00 p.m. to 3:30 p.m. **AND** from 6:30 p.m. to 8 p.m.

Los Angeles Theater Center, 514 S Spring St, Los Angeles
Saturday, April 17th from 11 a.m. to 12:30 p.m.

We hope that you are able to join us for one of the community update meetings. Presentation materials will be posted on the project website at the conclusion of these meetings.

Metro appreciates your continued involvement and participation. Should you have any questions, please do not hesitate to contact us by visiting the Regional Connector Transit Corridor Study website at www.metro.net/regionalconnector or email us at regionalconnector@metro.net.

Best Regards,

The Regional Connector Project Team

Project Update Meetings

You are invited to a Metro project update meeting on the Regional Connector Transit Corridor Draft EIS/EIR

This study is looking at ways to directly connect the Metro Gold, Blue and Expo Lines through Downtown Los Angeles.

At the upcoming April 2010 meetings, Metro will present information about the new fully grade-separated alternative added to the study by the Metro Board of Directors. The presentation will also include an update on the technical studies and review the project alternatives currently being evaluated.

Please mark your calendar and plan to attend one of the update meetings. (There is no need to attend multiple meetings as identical information will be presented at each.)

Friday, April 9, 2010
noon - 1:30pm
Los Angeles Central Public Library
630 W 5th St, Los Angeles

Tuesday, April 13, 2010
6:30pm - 8pm
Lake Avenue Church
393 N Lake Av, Pasadena

Wednesday, April 14, 2010
2 pm - 3:30pm and 6:30pm - 8pm
Japanese American National Museum
369 E 1st St, Los Angeles

Saturday, April 17, 2010
11am - 12:30pm
Los Angeles Theater Center
514 S Spring St, Los Angeles

All locations are accessible by public transit.
For more information call 213.922.7277
or visit metro.net/regionalconnector.

Project Update Meetings

You are invited to a Metro project update meeting on the Regional Connector Transit Corridor Draft EIS/EIR

This study is looking at ways to directly connect the Metro Gold, Blue and Expo Lines through Downtown Los Angeles.

At the upcoming April 2010 meetings, Metro will present information about the new fully grade separated alternative added to the study by the Metro Board of Directors. The presentation will also include an update on the technical studies and review the project alternatives currently being evaluated.

Please mark your calendar and plan to attend one of the update meetings. (There is no need to attend multiple meetings as identical information will be presented at each.)

Friday, April 9, 2010
noon - 1:30pm
Los Angeles Central Public Library

Gracias por su continua participación en la planeación del Conector Regional – una conexión de tren ligero a través de Downtown Los Angeles que proporcionará beneficios de movilidad a la región entera.

El Borrador de la Declaración/Reporte del Impacto Ambiental (Borrador EIS/EIR) del Corredor de Transporte Conector Regional examinará enlaces potenciales de transporte de tren ligero (LRT) entre los sistemas de Metro Gold Line, Blue Line y Expo Line existentes. Una vez completado, los usuarios disfrutarán de más conexiones de transporte a través de todo el sistema LRT. El Borrador EIS/EIR incluye la revisión de los posibles efectos de las alternativas del proyecto en el área de estudios del proyecto.

Thank you for your continued involvement in planning the Regional Connector – a light rail connection through Downtown Los Angeles that will provide mobility benefits to the entire region.

The Regional Connector Transit Corridor Draft Environmental Impact Statement/Report (Draft EIS/EIR) will examine potential Light Rail Transit (LRT) linkages between the existing Gold, Blue and Expo Line systems. Once completed, transit riders would enjoy increased connections throughout the entire LRT system. The Draft EIS/EIR includes the review of the possible effects of the project alternatives in the project study area.

You are invited to a community meeting for the Regional Connector Transit Corridor Project.

In February 2010, Metro's Board of Directors voted to include a fully-grade separated alternative in the Draft EIS/EIR. We would like to introduce you to the new project alternative and provide you with an update on the progress of the study to date. Please join us at one of the following locations for the next round of community meetings:

Friday, April 9, 12pm-1:30pm
Los Angeles Central Public Library
630 W 5th St, Los Angeles
This meeting is tentatively scheduled to be broadcast live from *metro.net/regionalconnector.*

Tuesday, April 13, 6:30pm-8pm
Lake Avenue Church
393 N Lake Av, Pasadena

Wednesday, April 14, 2pm-3:30pm and 6:30pm-8pm
Japanese American National Museum
369 E 1st St, Los Angeles

Saturday, April 17, 11am-12:30pm
Los Angeles Theater Center
514 S Spring St, Los Angeles

Content presented at each meeting will be identical. All locations are accessible by public transit.

ADA Requirements
Special accommodations are available to the public for Metro-sponsored meetings. All requests for reasonable accommodations must be made at least 3 working days (72 hours) in advance of the scheduled meeting date. Metro's TDD line is 1.800.252.9040.

Information
For additional information on the Regional Connector, please visit our project website at *metro.net/regionalconnector* or call the project information line at 213.922.7277.

Está invitado a una reunión comunitaria para el proyecto del Corredor de Transporte Conector Regional.

En febrero de 2010, la Junta Directiva de Metro votó para incluir una alternativa de grado separado completo en el Borrador EIS/EIR. Nos gustaría presentarle la nueva alternativa del proyecto y proporcionarle una actualización sobre el progreso del estudio. Por favor asista a una de las siguientes reuniones para participar:

Viernes 9 de abril, 12pm-1:30pm
Los Angeles Central Public Library
630 W 5th St, Los Angeles
Esta reunión ha sido tentativamente programada para ser presentada en vivo a través de *metro.net/regionalconnector.*

Martes 13 de abril, 6:30pm-8pm
Lake Avenue Church
393 N Lake Av, Pasadena, CA

Miércoles 14 de abril, 2pm-3:30pm y 6:30pm-8pm
Japanese American National Museum
369 E 1st St, Los Angeles

Sábado 17 de abril, 11am-12:30pm
Los Angeles Theater Center
514 S Spring St, Los Angeles

El contenido presentado en cada una de las reuniones será idéntico. Se puede llegar a todos los lugares de reuniones usando transporte público.

Requerimientos ADA
Comodidades especiales están disponibles para el público asistente a las reuniones patrocinadas por Metro. Peticiones para adaptaciones razonables deben ser sometidas por lo menos tres días laborables (72 horas) antes de la fecha programada para la reunión. La línea TDD de Metro es 1.800.252.9040.

Información
Para obtener información adicional sobre el LRT del Conector Regional, por favor visite el sitio Web del proyecto en *metro.net/regionalconnector* o llame a la línea de información del proyecto al 213.922.7277.

地域コネクター・トランジット回廊地帯プロジェクトのためのコミュニティー集会にご招待します。

Metroの理事会は2010年2月、完全にグレード分けした代替案を草案EIS/EIRに取り入れることを票決しました。この新しい代替案を紹介し、これまでの調査の進捗状況を発表したいと思います。下記の日時に行われる次回のコミュニティー集会にご参加ください。

4月9日金曜日 12pm-1:30pm
ロサンゼルス中央図書館
630 W 5th St, Los Angeles
この集会は暫定的に*metro.net/regionalconnector*を通じて実況中継することになっています。

地域コネクター計画に対する継続的なご協力ありがとうございます。ロサンゼルスダウンタウンをを走る軽線路コネクションは地域コネクターは、全地域に交通の便宜を提供します！

地域コネクター・トランジット回廊地帯草案環境インパクト声明書／報告書(Draft EIS/EIR)では、既存のゴールド、ブルー、エキスポ路線システム間をつなぐ軽線路トランジット(LRT) の可能性を検討します。これが完成するとトランジットの使用者は全LRTシステムを通じてより多くのコネクションを利用することができるようになります。草案EIS/EIRには、プロジェクト調査エリアにおいて、プロジェクトの代替案による影響の可能性も含まれています。

Regional Connector Transit Corridor
Draft Environmental Impact Statement/ Draft Environmental Impact Report

APPENDIX I

AGENCY COORDINATION AND PUBLIC INVOLVEMENT
Little Tokyo Working Group

State Clearinghouse Number: 2009031043

MEETING SUMMARY

Project Name: Metro Regional Connector Transit Corridor Project

Organization: Little Tokyo Working Group

Date/Time: September 17, 2009; 6:00 - 8:00 p.m.

Meeting Location: Japanese American Community and Cultural Center, Garden Room
244 S San Pedro St, Los Angeles, CA 90012

Project Team: Dolores Roybal Saltarelli, Ann Kerman, Ray Sosa, Clarissa Filgioun, Ginny Brideau, Min Cheung, Yojo Kikuchi, Robin Akashi

Attendees:

Bill Watanabe	Mike Okamoto	Evelyn Yoshimura
Kene Kubo	Nao Gunji	Joanne Kumamoto
Craig Ishii	Chris Aihara	Chris Komai
Ron Fong	Lisa Suiki	Satoru Uyeda
June Berk	Andrew Lin	Alan Kumamoto

Summary:

This was the inaugural meeting of the Little Tokyo Working Group (LTWG), a subcommittee of the Little Tokyo Community Council's Planning and Cultural Preservation Committee (PCPC). The LTWG was convened to discuss issues pertinent to the Little Tokyo community as it relates to Metro's Regional Connector Transit Corridor project.

Prior to the start of the meeting, Metro made the at-grade and below grade emphasis models available for the LTWG members to view and informally discuss with staff and consultants. Members of the LTWG had questions about the tunnel surfacing north-east of 2nd Street and Central Avenue, and were interested in receiving more information about landscaping opportunities that would mask the visual impacts of the tunnel and portal at 1st and Alameda Streets. There was also a question about whether a parking garage could feasibly be constructed around the tunnel.

Alan Kumamoto began the meeting with introductions of LTWG members and Metro representatives. Mr. Kumamoto explained the structure and purpose of the LTWG which is intended to address Regional Connector project-related issues specific to Little Tokyo. The LTWG and Metro will work collaboratively to propose mitigation measures that address possible project impacts in this community.

Ann Kerman reminded the LTWG that the Regional Connector is still in its early stages of environmental analysis, there is much work left to be done and emphasized that Metro has not made any decisions regarding this project. It is critical for the LTWG to first review the

results from the technical studies and community feedback in order to be able to fully consider the alternatives.

She added that comments received during the public scoping period have been incorporated into a Scoping Report which will be released during Fall 2009. Metro continues to receive project related comments; these subsequent comments will be addressed and incorporated into the DEIS/R.

Ann then briefly introduced the "Mitigations Matrix," which will be used throughout the effort to track issues and potential mitigations in comparison with each of the four alternatives under consideration. She invited the LTWG to review the categories prior to the October 1 meeting and to provide any changes/additions which will be incorporated at that time.

Dolores Roybal Saltarelli and Ray Sosa then made a detailed presentation about a number of topics. Ms. Saltarelli explained how the four project alternatives were identified as part of the Alternatives Analysis process. Mr. Sosa then followed with an overview of the construction process and clarified various key points, such as refinements to the project since the close of the scoping period. Metro received a number of follow-up comments asking about the size of property needed to construct the portal. After further investigation, Metro believes that it would need to purchase the land under the Office Depot and Señor Fish, and not the other businesses that front Central Avenue if the underground alternative is selected. Businesses along Central Avenue would be able to stay open during the construction of the Regional Connector.

Several questions from the LTWG arose regarding the results of the scoping meeting. Metro clarified that comments submitted during the scoping process are still under review at this time. As additional questions and comments come in, information will be passed along to the technical team for resolution. However, questions and comments received after the close of the scoping period will not appear in the Scoping Report, but will appear in the DEIS/R for the community to review when it is released next summer.

Specific questions surrounding the property bounded by 1st, 2nd and Alameda Streets and Central Avenue focused on the tunnel transitioning from below grade to at-grade as the tracks cross 1st and Alameda Streets. The LTWG requested additional information regarding the construction process, including traffic impacts to Central Avenue and traffic control. Additionally, information regarding the aesthetic treatment of the tunnel walls was also requested.

Andrew Lin, a Savoy resident, stated that he had not received the project and meeting notifications Metro has distributed and asked what outreach to the Savoy had been conducted. He is also seeking additional information regarding the purpose and need for the project. He would like to review the projected ridership, and better understand the need for connecting at the Little Tokyo/Arts District Gold Line station.

Metro responded by promising to present a summary regarding outreach activities at both the Savoy Homeowners Association and next LTWG meeting.

The LTWG will review the at-grade emphasis alternative at the October 1, 2009 meeting. There will be a breakout session dedicated to discussing impacts and potential mitigating activities.

Items to discuss at future meetings:

- Discuss traffic control during construction, focused on Temple/Alameda, 1st/Alameda, 2nd/Alameda, and routing at 2nd/San Petro (at Kyoto Grand Hotel)
- Overall traffic impact of the project and during construction
- Construction timing and process, with particular attention to the Alameda underpass
- Go For Broke: Impacts with the at-grade emphasis alternative
- Outreach approach during AA and DEIS/R process (how meetings were advertised, outreach to Savoy and Little Tokyo)
- Current and future project need, including justification of ridership and station capacity and 2035 transportation needs

Hello, Ginny,

I just received email from June Berk, and I found the minutes from Sep. 17, 2009 meeting regarding my comments during the meeting. I found what you have written in the minutes regarding my comments misleading, and does not reflect what actually took place. You must remember that I was a little agitated during the meeting because I have only learned of the Regional Connector project in our front yard, about 150 feet, only about two weeks before this meeting, all the time Metro has been doing the study in the past three years. Please make the correction to the minutes regarding my comments. The following is a more correct description of what took place.

Andrew Lin, a Savoy resident, protested during the meeting and said that he did not receive any notification regarding the Regional Connector Project by mail, nor over 300 residents of Savoy owners for the past three years while the Regional Connector Project was under study. "How can this happen?", he questioned. He stated that the "overwhelming majority of comments received supported the project" as stated in Executive Summary Final dated Dec. 2008 was based on 88 people's responses, and questioned how can this happen without notifying the Savoy residents by mails, while he has received Public Hearing Notices by mails to nearby residents within 500 feet radius in the past. He also questioned how can the Executive Summary arrive at the conclusion that Regional Connector is needed without mentioning any ridership from present or past years, and instead used projected figures from year 2030, figures 21 years in the future, to justify it. "The study is not a scientific study", he said.

Dolores Saltarelli stated that she is in contact with Lynne Collmann at Savoy. To which, Andrew Lin replied that he has spoken to Lynne regarding notification by mail, and both confirmed to each other that they have never received any notification by mail from Metro in past three years.

MEETING SUMMARY

Project Name: Metro Regional Connector Transit Corridor Project

Organization: Little Tokyo Working Group

Date/Time: October 1, 2009; 6:00 - 8:00 p.m.

Meeting Location: Japanese American Community and Cultural Center, Garden Room
244 S San Pedro St, Los Angeles, CA 90012

Project Team: Dolores Roybal Saltarelli, Ann Kerman, Henry Gonzales, Gerald Alvares, Eric Carlson, Ray Sosa, Monica Villalobos, Yara Jasso, Helene Kornblatt, Clarissa Filgioun, Ginny Brideau

Attendees:

Ron Fong	Victor Lazo	Evelyn Yoshimura
Chris Aihara	Chris Komai	Goro Endo
Satoru Uyeda	Mary Graybill	Tom Kamei
Kei Nagao	Wilbur Takashima	Alan Nishio
Susie Tae	Bobby Garza	Paul Yeh
Eric Kurimura	Joanne Kumamoto	Alan Kumamoto

Update: Others who attended, with names not appearing on sign in sheet:
Andrew Lim

Summary:

This was the second meeting of the Little Tokyo Working Group (LTWG), a subcommittee of the Little Tokyo Community Council's Planning and Cultural Preservation Committee (PCPC). The LTWG was convened to discuss issues pertinent to the Little Tokyo community as it relates to Metro's Regional Connector Transit Corridor project.

Prior to the start of the meeting, Metro made the at-grade and below grade emphasis models available for the LTWG members to view and informally discuss with staff and consultants.

Chris Aihara and Wilbur Takashima chaired the meeting and led introductions. The meeting notes from the previous meeting were not available at the meeting, but are attached to this report.

Ann Kerman, of Metro, was asked to present information regarding outreach activities that have taken place from the initiation of the Alternatives Analysis study to date. A copy of the memo is attached to this report.

Dolores Roybal Saltarelli briefed the working group on the purpose and need for the Regional Connector. As Metro continues to expand their Light Rail Transit (LRT) system, the 7th/Metro Center and Union Stations will begin to reach capacity. The best way to address station capacity issues, lack of connectivity between the lines is to remove the need to transfer at both stations. By removing the need to transfer and by providing through service through Downtown Los Angeles, the LRT system can serve more transit riders and stations.

The working group then broke into 5 groups to discuss challenges, opportunities, and potential mitigations regarding the at-grade emphasis alternative. The result of this exercise is attached to this report. Each small group presented their findings of their discussion to the working group.

The LTWG will continue their review the at-grade emphasis alternative, and begin the review of the below-grade alternatives at the October 15, 2009 meeting. There will be a breakout session dedicated to discussing impacts and potential mitigating activities.

Items to discuss at future meetings:

- Discuss traffic control during construction, focused on Temple/Alameda, 1st/Alameda, 2nd/Alameda, and routing at 2nd/San Petro (at Kyoto Grand Hotel)
- Overall traffic impact of the project and during construction
- Construction timing and process, with particular attention to the Alameda underpass
- Current and future project need, including justification of ridership and station capacity and 2035 transportation needs

MEETING SUMMARY

Project Name: Metro Regional Connector Transit Corridor Project

Organization: Little Tokyo Working Group

Date/Time: October 15, 2009; 6:00 - 8:00 p.m.

Meeting Location: Japanese American Community and Cultural Center, 2nd Floor
244 S San Pedro St, Los Angeles, CA 90012

Project Team: Dolores Roybal Saltarelli, Ann Kerman, Henry Gonzales, Gerald Alvarez, Eric Carlson, Ray Sosa, Monica Villalobos, Yara Jasso, Helene Kornblatt, Virginia Jackson, Clarissa Filgioun, Ginny Brideau

Attendees:

In addition to those listed below, 6 people were heard on the tape, but did not sign in

Chris Aihara	Victor Lazo	Evelyn Yoshimura
Kristin Fukushima	Kei Nagao	
Alan Kumamoto	James Okazaki	
Joanne Kumamoto	Susie Tae	
Chris Komai	Wilbur Takashima	

Summary:

This was the third meeting of the Little Tokyo Working Group (LTWG), a subcommittee of the Little Tokyo Community Council's Planning and Cultural Preservation Committee (PCPC). The LTWG was convened to discuss issues pertinent to the Little Tokyo community as it relates to Metro's Regional Connector Transit Corridor project.

Prior to the start of the meeting, Metro made the at-grade and underground emphasis models available for the LTWG members to view. Several members of the Working Group viewed the models and had questions answered by members of the Metro project staff and consultant team.

Wilbur Takashima and Chris Aihara chaired the meeting and led introductions. The written summary from the previous meeting (the At-Grade Emphasis alternative) was briefly reviewed as the meeting began. Wilbur asked whether the LTWG wanted to proceed with discussing the underground emphasis alternative. The LTWG agreed that many questions remained both about the at-grade alternative and also about details related to potential project mitigation activities.

A brief conversation about the at-grade emphasis focused on traffic operations and control after construction specific to the Alameda undercrossing. The LTWG would like to ensure that businesses along Temple, Los Angeles and 2nd Streets are included in the identified impacted area. James Okazaki would also like Metro to identify the impacts to City Hall, the Caltrans building and the new

police station. There were questions regarding construction staging locations and how the street would be "decked" to allow for free-flowing traffic unimpeded by construction activities taking place underground. The LTWG asked for more information about what kind of turn restrictions could be expected along Judge Aiso, Temple, Alameda, 1st and 2nd Streets, and Central Avenue. The Working Group also asked for more information about maintaining freeway access, and which local streets would experience increased traffic as a result of the project.

A discussion about potential mitigation measures, including the Mitigation Monitoring Plan, then followed. There were questions about how this plan would be developed and enforced. Additionally, the Working Group wanted to know if there is a mechanism in place, besides federal monitoring, to ensure that Metro will actually implement the mitigations identified and agreed upon with the community, and what the consequences would be if the mitigation plan were not followed. The LTCC requested a clear written statement identifying the mitigation activities and how monitoring will take place.

Chris Komai was especially concerned that "mitigation" implies only monetary reimbursement when many of the impacts, such as cultural and historical resources, may not be able to be mitigated by money. James Okazaki felt that money could be an "equalizer" and that Metro would need to set aside funding to mitigate impacts. The LTWG agreed that it is important to discuss and identify intangibles (e.g. "sense of community") during the environmental process, and wants to set aside time at a later meeting to identify and discuss such intangibles.

Alan Kumamoto wanted to know whether monetary reimbursements were considered as a part of the mitigation efforts and what would the threshold be for small businesses to access the funding. It was further clarified that while there is a restriction on utilizing federal funds to provide monetary compensation, however there is not such restriction for local funds e.g. through CRA/LA or another City agency.

Metro explained that a mitigation plan would identify the construction activities, when specific construction activities would take place, and the specific mitigating activities to take place in coordination with those construction activities. Metro is required to develop a mitigation monitoring plan with associated milestones for the Draft EIR/S, which will be reviewed with the community for input. The mitigation measures, as they appear in the Draft EIR/S, will become a contractual agreement between Metro and the community.

The LTWG would like examples of how the mitigation plans are developed, approved, and enforced. The LTWG requested an example of a mitigation monitoring program, and Metro will provide this information at the next meeting.

Kei Nagao of the LTWG raised concerns that the Working Group does not have the expertise to make decisions that are based on technical information provided by Metro. The lack of understanding of the overall process and the process to identify mitigations is unsettling to the community. She requested that Metro consider hiring a consultant with expertise in the environmental process to work directly with the group to discuss both the mitigations effort and environmental process. She

would also like Metro to consider scheduling site visits with the community. The LTWG agreed that a consultant to assist the group with understanding the process, and identifying potential impacts and mitigations would be preferable.

June Berk asked to go on record to be sure that none of the project alternatives would impact the "Go For Broke" monument; specifically, she opposes any alternative that would impact the monument. She stressed the cultural and historical importance of the monument is not just to Little Tokyo in Los Angeles, but to every Japanese American who was interned or in military service during World War II. She is sincerely and deeply concerned that Little Tokyo has been forced to give up property for government buildings, and would like to prevent this from happening in the future. She wants to protect the cultural viability of Little Tokyo, and feels like the overall situation is dire. Mr. Takashima acknowledged that this is an emotional issue, and reiterated that the community needs to be educated so it can ask the hard questions.

Metro then proceeded with a presentation of information about the underground emphasis alternative. A member of the LTWG felt that the nomenclature of this alternative was misleading because it implies that it is all below ground.

Metro provided background about the selection of the Build Alternatives. During the earlier Alternatives Analysis portion of the study, several underground alternatives were identified, but were eliminated for a number of reasons. These included uncertainty about future use of the Mangrove property (the City of Los Angeles was still in the Request for Proposals (RFP) process for that project), the Little Tokyo/Arts District station was under construction, and assurances were made to the Buddhist Temple that their property would not further impacted. Since that time, the Mangrove property use has been resolved and is now known as the Nikkei Center development.

Metro announced that new options are being explored to determine if the underground-emphasis alternative can be modified to address community concerns at 1st/Alameda, potentially utilizing property below the Nikkei Center. No further details were available at the time of the meeting as this modification is currently being explored.

Metro representatives then explained the potential benefits of the Alameda underpass, including reducing truck traffic noise, as well as the possibility of extending the length of the underpass, which would create a larger pedestrian plaza. The LTWG was interested in the type of landscaping that could be utilized at the underpass and portal, with many in support of visually appealing landscaping cover.

The Working Group also asked for more information about permanent on-street parking restrictions, location of peak- and off-peak parking, and the identification of new parking opportunities. One opportunity may be to create additional off-site parking for Savoy residents and visitors.

Metro then explained the construction process for the underground emphasis option, starting with the cut and cover process, and how the tunnel boring machine (TBM) would be installed. Staging would take place where Señor Fish and the Office Depot buildings are currently located. Businesses

facing Central Avenue would be able to remain open during construction. Metro would ensure that traffic continues to flow as freely as possible during construction. Traffic control plans will be incorporated into the Draft EIR/S will be available for review by both the community and City of Los Angeles.

In regards to the tunneling, the LTWG asked about existing underground utilities, and what kind of utilities would need to be relocated as a part of the project. Metro explained that the large storm drain located under 2nd Street near Alameda Street would have to be relocated as part of project.

Several questions about the location and depth of the water table in the Little Tokyo area were asked. Members of the LTWG noted that during construction of JANM and the Little Tokyo/Arts District station, the water table was a consideration. If there was considerable water leakage, the tunnel would need to be sealed. This will be further evaluated in the Draft EIR/S.

James Okazaki asked if the project would be bid as a Design/Build contract. Metro explained that its policy is typically to bid the Design and Build contracts separately when a tunnel is involved.

Members of the LTWG wanted clarification of the project time line. Metro stated that the underpass for the Regional Connector would take up to two years to build, and could be the first or last construction element. There will be a staging presence for about four years. High impact construction activities would take place above ground over several weekends after which construction would continue underground with minimal impacts at the surface. It is possible to schedule construction activities to take place when the community would be least impacted. For example, construction in the predominately business area could take place at night and weekends, and in the residential areas during the weekday. The contractor would be required to recognize identified community events and cease operations during this time. This is an extremely important point for Nisei Week activities. A follow-up question was asked comparing the impacts if construction were to start at 1st/Alameda or 2nd/Hope; it was clarified that the latter is a difficult location technically and is close to sensitive residential uses as well as the Disney Hall.

June Berk asked when the Regional Connector's operational schedule would be available. There is concern about the volume of trains that would travel through Little Tokyo, and how off-schedule trains would impact safety. Metro explained that the schedule would not be prepared until after the project is constructed, i.e. close to opening. Modeling information is used to determine how many trains could be expected through the area, but this information is not a substitute for a passenger schedule.

Representatives from The Savoy wanted to understand how traffic on Alameda Street would operate with the Underground Emphasis alternative. Metro explained that automobiles traveling westbound could make a left turn on Alameda Street, but eastbound traffic would not. Vehicles seeking to make a left turn would need use Temple Street to make the turn.

There was a brief discussion about whether construction could compromise the older buildings in this neighborhood. Metro explained that soldier piles are installed prior to construction on the

perimeter of the cut and cover construction area. This strengthens the foundations and the street, and provides the structure for the concrete decks. Grouting is used only if there is settlement. Pre-construction surveys are conducted prior to any construction to determine the existing condition of the buildings. The survey involves taking photographs and making videos of the building foundations located along the alignment. This was the same process successfully used during the construction of the Metro Gold Line Eastside Extension.

Alan Kumamoto asked if Metro was planning on reaching out to any of the international firms to solicit a peer review of the project. Dolores said she was open to this taking place.

Prior to the end of the meeting the LTWG restated their request for a technical consultant to be made available that would work on their behalf. They are seeking more information about typical mitigations that could be employed in Little Tokyo, and what kind of impacts they might expect during construction. Metro undertook to present examples of mitigation plans from other projects at the next meeting, though noted that these may not necessarily apply to Little Tokyo.

The next LTWG meeting is scheduled to take place November 19, 2009 at the Japanese Community and Cultural Center. The agenda will include the continued discussion of the below underground emphasis alternative.

Items to discuss at future meetings:

- Continued discussion about the Underground Emphasis Alternative
- Possible technical consultant to support the LTWG
- Examples of mitigation and mitigation monitoring plans from similar type construction projects
- Discuss traffic control during construction, focused on Temple/Alameda, 1st/Alameda, 2nd/Alameda, and routing at 2nd/San Petro (at Kyoto Grand Hotel)
- Overall traffic impact of the project and during construction
- Construction timing and process, with particular attention to the Alameda underpass
- Current and future project need, including justification of ridership and station capacity and 2035 transportation needs

MEETING SUMMARY

Project Name: Metro Regional Connector Transit Corridor Project

Organization: Little Tokyo Working Group

Date/Time: November 19, 2009; 6:00 - 8:00 p.m.

Meeting Location: Japanese American Community and Cultural Center, 2nd Floor
244 S San Pedro St, Los Angeles, CA 90012

Project Team: Dolores Roybal Saltarelli, Ann Kerman, Arthur Henry, Laura Cornejo, Henry Gonzales, Gerald Alvarez, Eric Carlson, Ray Sosa, Helene Kornblatt, Virginia Jackson, Clarissa Filgioun, Ginny Brideau

Attendees:

Chris Aihara
June Berk
Ron Fong
Kristin Fukushima
Bobby Garza
Mary Graybill
Marc Hentell
Ernest Hida
Craig Ishii
Tom Kamei
Alan Kumamoto
Joanne Kumamoto
Eric Kurimura
Victor Lazo
Andrew Lin
Kei Nagao
Roy Nakahara
Setsuko Nakahara
Alan Nishio
Mike Okamoto
Johnnie Raines
Susie Tae
Wilbur Takashima
Satoru Uyeda
Robert Volk
Sindey Wang
Bill Watanabe
Steven Wechster
Jerard Wright
Paul Yeh
Evelyn Yoshimura

Summary:

This was the fourth meeting of the Little Tokyo Working Group (LTWG), a subcommittee of the Little Tokyo Community Council's Planning and Cultural Preservation Committee (PCPC). The LTWG was convened to discuss issues pertinent to the Little Tokyo community as it relates to Metro's Regional Connector Transit Corridor project.

Wilbur Takashima and Chris Aihara chaired the meeting and led introductions. The written summary from the previous meeting was briefly reviewed as the meeting began. Chris reminded the Working Group members to commit to attending as many meeting as possible in order to have consistency and continuity in the review of all of Metro's project alternatives.

Wilbur asked for clarification regarding the differences between Urban Design Working Group (UDWG) and the LTWG. Dolores Roybal Saltarelli explained that the purpose of the UDWG process was to focus on the urban design of the project as a whole, and noted that there had been a meeting of the group as a whole, as well as separate breakout discussions with

Financial District, Bunker Hill and Little Tokyo area stakeholders as part of that process. The UDWG was formed before the LTWG was convened, and has a different purpose from the LTWG, which has a far broader role in addressing numerous topics as it relates to Little Tokyo exclusively. Wilbur also asked how often Metro meets with individual stakeholders outside of the LTWG meetings. He referenced Metro's recent fact sheet, calling out the numerous groups Metro has met with during the Alternatives Analysis and Draft EIS/R process to date.

Ann Kerman presented a draft scope of work identifying the process for securing a consultant to assist the LTWG during the environmental process. A copy of this memo is attached to this document. Alan Nishio asked that the consultant should report to the LTCC, and not the LTWG. Ann further explained that the consultant would be the choice of the LTCC, but Metro is asking the LTCC to identify a person or firm who has understanding of and expertise in light rail operations, right-of-way requirements, construction impacts, transportation planning, economic and community development, the EIS/R process, urban design, and station area planning. The consultant would work with the LTWG/LTCC until the release of the Draft EIS/R.

Bill Watanabe requested that the consultant should well versed in the understanding and identification of mitigation measures. Alan Kumamoto wanted more clarification regarding the selection process. Kei Nagao requested that as-needed translation and interpretation services be available to support the consultant. Chris then asked about the timeline for bringing a consultant onboard. Ann undertook to come back to the LTWG with a final draft of the scope, which would be presented to the LTWG at its next meeting. Additional comments from the LTWG should be sent to Ann Kerman by December 1, 2009.

Dolores moved on to present the conceptual design for the 3rd Build Alternative, a new alternative that would pass entirely under the 1st/Alameda intersection. This alternative would include a station located at 2nd Street and Broadway, as well as a new shallow station at the Office Depot site; there would no longer be a station at 2nd and Los Angeles Streets. The alternative is similar to the current Underground-Emphasis alternative, with the exception that this alignment would continue to travel below-grade under 2nd Street to a new station under the Office Depot property, and continuing under the street at 1st/Alameda.

Other features of this new alternative include that the tracks would not surface at-grade until north of 1st Street and east of Hewitt Street, and there would be additional turn restrictions from Hewitt, 1st, and Alameda Streets. Further, there would not be an at-grade crossing or a pedestrian bridge at 1st and Alameda Streets, and Alameda would not change grade between Temple and 2nd Streets. In the initial operations of the Regional Connector, there would be north and south bound train service. The project would cost approximately $200 million more than the Underground-Emphasis alternative.

The graphic showing the underground alternative is available for review at http://thesource.metro.net, Metro's transportation blog.

The construction of the new build alternative would involve tunneling under 2nd Street to Central Avenue. From 2nd/Central, Metro would use "cut and cover" construction, excavating to create space for the station, and placing the below-grade crossing at 1st/Alameda. Temporary track would need to be installed on the eastern side of Alameda in order to maintain Gold Line service to East Los Angeles. It is likely that additional property would need to be acquired from the Nikkei development and from an area west of the Nishii Temple in order to make space for both the tracks and 1st Street.

While there would be traffic impacts at 1st/Alameda, Metro is committed to working with both the City of Los Angeles and the community to ensure that impacts are mitigated. Ray and Dolores explained that they have not yet met with the Metro Board of Directors or LADOT about the new alternative, although a meeting is scheduled to take place in the near future.

Robert Volk sees this new alternative as a "real step forward", however he is still concerned with construction impacts at 1st and Alameda Streets. Dolores explained that construction timing and sequencing would be developed with the community input. It is likely that once the intersection is decked, the surface traffic would flow as it does currently.
Robert also asked if John Kaji has been made aware of the additional property needed at the Nikkei development for this new alternative. James Okazaki wanted to know whether a portal could connect with the Nikkei development. Dolores explained that Metro has met with John Kaji, and will meet again with him in December once additional technical details for the new build alternative become available.

Andrew Lin asked about the number of LRT trains that would travel through the 1st/Alameda intersection daily. With the Underground Emphasis Alternative, he estimated 576 trains a day. Dolores noted that with the 100% grade-separated alternative, there would be no at-grade crossings at 1st and Alameda Streets, and because the trains would not travel at grade, there wouldn't be the associated noise impacts.

Chris asked about the tunnel boring process, how the Tunnel Boring Machine (TBM) would be dropped into the ground, and whether this would take place in Little Tokyo at 2nd/Central or at 2nd/Hope near Bunker Hill. Metro will evaluate the potential impacts of TBM placement in the Draft EIS/R. The LTWG's preference is that the TBM be inserted at 2nd/Hope and not at 2nd/Central.

There were questions about the possibility of abandoning the surface track at the Little Tokyo/Arts District station once the Regional Connector is constructed. Metro emphasized that the Gold Line Eastside Extension has only just opened, and that technical and ridership studies have not been completed for the new build alternative.

Evelyn Nishimura asked whether the addition of the 3rd Build alternative would impact the project schedule and Dolores confirmed that it would not. She explained that the next step for the project involves going to the Metro Board of Directors to receive their approval to

include it in the environmental work currently underway. This would be done if the LTWG would support moving forward with analysis of this new alternative.

Alan Nishio made the following motion, which was seconded by Chris Aihara and approved by the LTWG as follows: ***"The LTWG recommends to the LTCC Board to endorse the concept and preliminary design as presented today for the third build alternative."*** The motion was approved with a vote of 23 ayes, and zero "no" votes.

LTWG will continue working to identify potential mitigations for each build alternative. In the meantime, the LTWG asked the Metro technical team to present information about this 3rd Build alternative at the next LTCC meeting. There was a question about the possibility of removing the underground-emphasis alternatives from further environmental review. However, Dolores and Ray explained that removing the alternative at this juncture could threaten future federal funding for the Regional Connector.

The DEIS/R will be released for public review during the summer of 2010 prior to its presentation to the Metro Board of Directors, with staff providing their recommendation for the Locally Preferred Alternative (LPA). Once the LPA has been chosen, additional technical work will be completed. The Regional Connector does not become a "project" until the Metro Board of Directors approves the Final EIS/R. Dolores emphasized that Metro will continue to work with the LTWG to address issues related to the Regional Connector, including developing potential mitigation measures so the document should not contain any surprises.

In response to the LTWG's request at its previous meeting for examples of mitigation plans, Metro distributed a CD containing examples from Seattle and the Metro Gold Line Eastside Extension mitigation programs. The documents will be discussed at a future meeting.

There was a short discussion regarding whom Metro sees as the official representative of Little Tokyo. Metro noted that it continues to meet with stakeholders individually, often at their request, as well as with larger groups. The LTCC represents a number of stakeholders that Metro has met with during the project.

Ann mentioned that she is aware that some Little Tokyo stakeholders who would like to participate in the LTWG, are currently unable to attend meetings because of scheduling conflicts on Thursday evenings Ann wondered whether the LTWG could occasionally meet on Tuesday or Wednesday evenings to accommodate those unable to meet Thursdays.

Items to discuss at future meetings:

- Updates regarding the technical consultant to support the LTWG
- Continued discussion about the 100% grade separated Alternative
- Discussion of examples of mitigation plans
- Discuss traffic control during construction (e.g. on Temple/Alameda, 1st/Alameda, 2nd/Alameda, and routing at 2nd/San Petro at Kyoto Grand Hotel)

- Overall traffic impact of the project and during construction
- Construction timing and process, with particular attention to the underground-emphasis alternative's Alameda underpass
- Current and future project need, including justification of ridership and station capacity, and 2035 transportation needs

Upcoming Schedule

- Next meeting is Thursday, December 17, 2009 at 6 p.m.

Little Tokyo Working Group Consultant

for the

Regional Connector Transit Corridor Draft EIS/R

OVERVIEW

The Little Tokyo Working Group (Working Group), a committee of the Little Tokyo Community Council (Council) seeks to engage the services of a consultant who can assist the Working Group in the development of proposed mitigations for the Regional Connector Transit Corridor Project Draft EIS/R. The Project will connect the Metro Gold Line Pasadena and Eastside segments to the Blue Line and Expo Line. This will place Little Tokyo at the center of a regional rail system, making it one of the most accessible communities in the County. The consultant will work with the Working Group to help them understand the Draft EIR/S process and identify potential impacts and mitigations associated with the development of a new transit link within downtown Los Angeles. The consultant will provide the following functions: (1) provide a technical resource to Little Tokyo community during the development of draft environmental documents for the Regional Connector Transit Corridor Project; (2) help the Working Group identify impacts and potential mitigations for each build alternative that will protect the historical and cultural integrity of Little Tokyo; and (3) extract the concerns of residents, businesses and stakeholders in Little Tokyo and recommend potential mitigations for inclusion in the Draft Environment Impact Statement/Environment Impact Report (Draft EIS/R).

CONTEXT OF REQUESTED WORK: HISTORY OF THE LITTLE TOKYO COMMUNITY

Land use has long been a contentious issue in Little Tokyo. As one of only three remaining official Japantowns in the United States, Little Tokyo has felt continually threatened with development that could eradicate it. At its peak, Little Tokyo had approximately 30,000 Japanese Americans living in an area that covered over one square mile, but the internment of Japanese Americans during WWII emptied Little Tokyo. After the war, Japanese Americans returning from the internment camps moved into other areas surrounding downtown. What is left of the original Little Tokyo can be found in roughly four city blocks today. This sense of an ever-shrinking Little Tokyo and resistance to development in the area is supported by the development of Parker Center at the former site of the Nishi Hongwanji Buddist Temple and the First Street business strip, as well as Weller Court which was developed on property that was formerly a strip of family-owned small businesses. The Regional Connector Transit

Corridor Project is seen by some in the Little Tokyo Community as one more attempt to encroach into Little Tokyo and further reduce its size and viability. However, the investment of transit dollars and siting of the Regional Connector in Little Tokyo may be a rare opportunity to ensure that the historic and cultural identity of Little Tokyo is protected for years to come by the inclusion of specific mitigations in the Draft EIS/R for the Regional Connector Transit Corridor Project. Such mitigations can help take advantage of and leverage the enhanced accessibility to Little Tokyo from all parts of the region and Southern California that would accompany implementation of the Regional Connector project

PROCESS:

Metro is in the process of developing a mechanism to provide funding not to exceed $30,000 for purposes described above. This mechanism with be described in detail in future drafts. Funding must be used exclusively to pay for said consultant. The consultant will be secured through an independent search process subject to Metro's approval that the consultant is qualified in the areas stated below. It is expected that the term of engagement will be no longer than six months or through the release of the Draft EIS/R by Metro. The consultant must commit to a reasonable deadline and to work within a proscribed budget. No changes in the project timeline or schedule will be permitted.

QUALIFICATIONS:

It is expected that the consultant has expertise in the following areas:

- Light Rail operations both street running and underground.
- Right-of-way requirements
- Construction impacts
- Transportation Planning including traffic, parking and pedestrian issues
- Economic Development
- Community Development
- Draft EIS/R Process
- Urban Design and Station Area Planning
- Others as appropriate

CONSULTANT TASKS

1) Communicate with the Little Tokyo community and provide technical assistance to small businesses and residents on how the Project may affect them.
2) Assist the Little Tokyo community in understanding:
    - How the Draft EIS/R works
    - How the environmental process works
3) Assist Little Tokyo in identifying potential impacts and mitigation measures for each build alternative for incorporation into the Draft EIS/R for the Regional Connector Transit Corridor Project.

MEETING REPORT

Project Name:	Metro Regional Connector Transit Corridor Study
Organization:	Little Tokyo Working Group
Date/Time:	December 17, 2009; 6 p.m.
Meeting Location:	Japanese American Community and Cultural Center
Project Team:	Dolores Roybal Saltarelli, Laura Cornejo, Gerry Alvarez, Ann Kerman, Eric Carlson, Ray Sosa, Kansai Uchida, Ginny Brideau
Attendees:	Roy Nakahara, Goro Endo, Robert Volk, Kristin Fukashima, Sean Miura, Wilbur Takashima, Jerard Wright, Yukio Kawaratani, Bill Watanabe, Ron Fong, Chris Komai, Evelyn Yoshimura, Kim Tachiki-Chin, Eric Kurimura, Alan Nishio, Kei Nagao, Chris Aihara, James Okazaki, Jeff Carpenter, Jeff Liu, Satori Uyeda, Mary Graybill, Susie Tae
Action Items:	• Provide Working Group with updated consultant terms • Ann Kerman to provide a list of firms from Metro's "Bench"

Summary:
This was the fifth meeting of the Little Tokyo Working Group (LTWG), a subcommittee of the Little Tokyo Community Council's Planning and Cultural Preservation Committee (PCPC). The LTWG was convened to discuss issues pertinent to the Little Tokyo community as it relates to Metro's Regional Connector Transit Corridor project.

Wilbur Takashima and Chris Aihara chaired the meeting and led introductions. The purpose of the meeting was to discuss the draft consultant agreement and updates to the potential build alternative.

Ann Kerman presented a draft scope of work identifying the process for securing a consultant that would assist the LTWG during the development of the project mitigation measures, and would review the Draft EIS/R on LTCC's behalf. A copy of the draft scope is attached to this document.

3108 Los Feliz Boulevard
Los Angeles, CA 90039
323.669.9100 Phone
323.669.9800 Fax
www.therobertgroup.com
info@therobertgroup.com

Ann further explained that while the consultant would be the choice of the LTCC, Metro is requesting that the LTCC identify a person or firm who has understanding of and expertise in light rail operations, right-of-way requirements, construction impacts, transportation planning, economic and community development, the EIS/R process, urban design, and station area planning. The consultant would work with the LTWG and LTCC until the release of the Draft EIS/R.

The consultant would submit invoices to the LTCC, which the LTCC would approve and send to Metro for payment. Metro would be responsible for timely payment based on the invoice submitted.

LTCC will decide internally how the consultant will be managed, and who will manage this person/firm. Chris Aihara and Don Watanabe asked if Metro could provide any direction or suggestions on how to best reach out to the professional community. Ann offered to provide a copy of firms listed on Metro's "bench" to Don. Chris wanted to set up a small committee to identify a potential consultant. The committee will meet on the 28th and 29th of December. The committee includes Chris, Alan Nishio, Ron Fong, and Yukio Kawaratani.

The Working Group is concerned they won't have enough time to get the consultant up to speed on the project, and won't be prepared to review the Draft EIS/R. They understand the work of the consultant would conclude by the time the Draft EIS/R is released to the community. Dolores tried to impress upon the Working Group that they would have ample opportunity to provide feedback and fine-tune mitigations, including the review of the station and urban designs.

The LTWG also wanted to be sure that once the consultant's funds are expended that the LTCC would not incur any additional debt. Ann reassured the LTWG they would continue to have the entire Metro consultant team to provide support. The consultant is not intended to replace Metro's consultant team.

Don expressed his appreciation to Metro for working with the LTCC and trusting the council to go through this process.

Dolores provided an update on the third build alternative and provided an overview of the initial operating plan. Metro is continuing to develop the initial concept for this third alternative with the support of its construction and operations departments. Dolores will update the Metro Board of Directors at its February meeting about the new alternative, so that the Board will authorize Metro staff to move forward with adding this

alternative to the full study. Dolores recently provided a briefing to Supervisor Molina's office as well as the City of Los Angeles Department of Transportation.

A short discussion followed regarding the topics for the next meeting. Because of the holidays, the need for Metro to continue developing the conceptual designs for the third build alternative, and time needed for the LTCC to hire the consultant, the next Working Group meeting is anticipated to take place on Thursday, January 21, 2010.

The meeting ended shortly before 7:30.

MEETING REPORT

Project Name: Regional Connector

Organization: Little Tokyo Working Group

Date/Time: February 18, 2010; 6 to 8 p.m.

Meeting Location: Japanese American Cultural and Community Center

Project Team: Dolores Roybal Saltarelli, Ann Kerman, Ray Sosa, Virginia Jackson, Kansi Uchida, Helene Kornblatt, Ginny Brideau

Attendees:

Action Items:

- Metro encourages participation at the upcoming Metro Board of Directors meeting on February 25th
- Metro to provide an update on the study timeline

Summary:
Chris Aihara began by noting this would be the 6th meeting of the LTWG. Once the group introduced themselves, Chris reviewed the previous meeting summary and current meeting agenda.

Chris Aihara presented an update on the hire of Douglas Kim and Associates (DKA). A pre-meeting was held on February 17th to discuss the approach and management of the contract. The working group has identified a task force to manage the contract. Chris feels DKA will effectively represent the Little Tokyo Community during the EIR process.

Jason Yamaguchi asked about the hiring process, the total number of applicants, and who on the LTCC decided to hire DKA. He was supportive of the hiring process, just wanted to be clear on the process itself. Alan responded by noting all of the applicants were very strong, however there were certain characteristics of the firm provided the committee with assurances DKA would be a better fit for the LTCC. Wilbur introduced Jared Jerome of DKA. The firm's website is douglaskimandassociates.com

Dolores began by thanking the LTWG members who had attended the Planning and Programming meeting earlier in the day. The community's turnout was seen as support for the adding the new alternative to the study. The motion unanimously passed both the Measure R and Planning/Programming Committee meetings. She outlined the next steps, and what to expect at the Metro Board of Directors meeting, and what would happen if the new alternative were added to the study.

Dolores provided an update regarding the recent meeting with the Nishi Temple. Metro presented two variations to the Nishi Temple, with the Nishi Temple finding only the first variation (or single tunnel option) to be the only acceptable variation. The Nishi Temple

3108 Los Feliz Boulevard
Los Angeles, CA 90039
323.669.9100 Phone
323.669.9800 Fax
www.therobertgroup.com
info@therobertgroup.com

liked the treatment with vegetation and the trains as they move by, but did not like the second variation as the portal ended right at the "front door" to the Nishi Temple. The Working Group agreed to support the only variation supported by the Nishi Temple.

Ted Tanaka presented the two variations, highlighting different urban design treatments, and concepts used in the Phoenix Light Rail system.

Chris Aihara noted that no action is needed at this time.

Darryl Garibay asked about the location of the station in the fully grade separated alternative. Dolores explained the only possible location for the station with this alternative is at the Office Depot site. It is not possible to provide access to Union Station and to East Los Angeles, and place the station anywhere else. The station cannot be located at the Nikkei Center development, however it is possible to place a passenger portal directly connecting the station to the Center.

Evelyn Yoshimura asked what would happen if the fully grade separated alternative is not added to the project? She wanted to know if both stations along 2nd Street would continued to be studied, and who would make the final recommendation regarding the location of the station. Dolores explained that with the predominately below-grade alternative would continue to be studied as part of the DEIS/R process. If the predominately below-grade alternative is selected as the LPA, the Metro Board of Directors would make the final recommendation regarding the station location, and there would not be a station at the Office Depot property.

Satoru Uyeda asked if Metro could provide information that would identify businesses that would be impacted by construction. Ray Sosa explained that in the Draft EIR the community would see a large area of identified properties that could be impacted by construction, however it is possible that not all of the properties would be impacted. Metro will know more as Advanced Conceptual Design is completed and enters into Preliminary Engineering.

Ann Kerman discussed the LTWG's next steps. At the March 18th meeting, Doug Kim will be in attendance to begin the mitigations discussion. The LTWG asked Metro to provide an updated timeline for the Draft EIR review and the study's next steps.

The meeting concluded at 7:30 p.m.

MEETING REPORT

Project Name:	Regional Connector Transit Corridor Project
Organization:	Little Tokyo Working Group (LTWG)
Date/Time:	Thursday, March 4, 2010; 6 to 8 p.m.
Meeting Location:	Japanese American Cultural and Community Center
Project Team:	Dolores Roybal Saltarelli, Eric Carlson, Ann Kerman, Ray Sosa, Kansai Uchida, Ginny Brideau
Attendees:	Chris Aihara, Edwin Barker, June Berk, Ron Fong, Kristin Fukashima, Bobby Garza, Mary Graybill, Yukio Kawaratani, Chris Komai, Alan Kumamoto, Joanne Kumamoto, Kei Nagao, Alan Nishio, Sawako Nita, Mike Okamoto, Susie Tae, Wilbur Takashima, Satoro Uyeda, Robert Volk, Bill Watanabe, Jason Yamaguchi, Vanessa Yee, Evelyn Yoshimura
Action Items:	• The LTWG requested the mitigation measure examples be resent to the group (completed) • Doug Kim to present Mitigations Measures Action Plan at next LTWG meeting

Summary:
Wilbur Takashima called the meeting to order at 6:00 p.m., and led introductions of those in attendance. Wilbur reviewed the agenda with LTWG members; items for discussion included an overview of mitigation measure examples from other rail transit projects in the country.

Dolores Roybal Saltarelli provided the LTWG with background about typical mitigation measures. She explained that mitigation measures for this project are intended to reduce or avoid impacts from construction and operation of the Regional Connector.

Dolores noted that the Draft Environmental Impact Study and Report (DEIS/R) would be available for public review in Summer 2010. Metro is requesting feedback from the Little Tokyo Community Council (LTCC) by April 15, 2010 regarding requested mitigation measures for inclusion in the DEIS/R. Dolores emphasized, however, that April 15th, 2010 is not the final deadline for submission of requested mitigations and that the Final EIS/R (FEIS/R) will be the last opportunity during the project to make changes to the mitigation measures suggested for the Regional Connector. The FEIS/R will become available for public review in Fall 2011. The FEIS/R will include a menu of mitigation measures, which will then become part of the Record of Decision (ROD) and ultimately the contract between the community and Metro.

3108 Los Feliz Boulevard
Los Angeles, CA 90039
323.669.9100 Phone
323.669.9800 Fax
www.therobertgroup.com
info@therobertgroup.com

The mitigation measures section of the DEIS/R will likely be listed in both paragraph and table form, calling out impacts connected to specific candidate mitigation measures. These measures will be developed by Metro in coordination with the LTWG, which will work with its consultant to recommend additional measures if needed. There will also be other opportunities to add or refine mitigation measures during Preliminary Engineering (PE), the next phase of the project.

Dolores asked the LTWG to refer to the mitigation plans from Sound Transit (located in Seattle, Washington) and the Metro Gold Line Eastside Extension (located in Los Angeles, California), which were distributed at the LTWG meeting on November 19, 2009. The LTWG requested that Metro resend the mitigation measure materials previously distributed.

Dolores then explained the steps needed to draft the environmental document. She clarified that numerous technical reports are still in the process of being drafted and will be submitted to Metro by the consultant. Once Metro completes the review, the draft document will be turned over to the Federal Transportation Administration (FTA). Once the FTA reviews the DEIS/R, the document will be released to the public for comment.

Doug Kim was introduced to the LTWG as the consultant hired by LTCC to support its role working with Metro on issues specific to Little Tokyo-during the DEIS/R phase of the Regional Connector project. Chris Aihara asked that Doug, as part of his scope, specifically address the selection of the Locally Preferred Alternative (LPA), identification of candidate mitigation measures, and his vision for the community process. Doug then discussed the purpose of the Mitigation Monitoring Plan (MMP), which will outline impacts and specific mitigation activities that can be implemented. The MMP identifies Metro's responsibilities and community expectations. Doug added that he would review the technical studies Metro has available prior to the next LTWG meeting. He would also like to lead a roundtable discussion with the LTCC, or community-at-large, by the end of April.

Bill Watanabe asked whether each alternative would have specific sets of mitigation plans. Dolores noted that Metro would identify a full list of mitigation measures for each alternative. Doug added that FTA would require Metro to study each of the build alternatives equally, identify potential impacts, and the associated mitigation measures. To allow the community and Metro greater flexibility once construction begins, Ray asked the LTWG to consider identifying an array of potential mitigations, rather than just one major activity to address individual impacts. .

Dolores pointed out that, in other jurisdictions, LPAs have been identified prior to the completion of the environmental process. Since the Little Tokyo community has identified a preferred alternative, the LTWG could consider focusing its time on identifying mitigation measures specific to the fully-grade separated alternative. The LTWG agreed to focus on the fully-grade separated alternative, but would still continue to evaluate the remaining alternatives.

Wilbur asked about the status of the Advanced Conceptual Engineering (ACE) and Preliminary Engineering (PE). Dolores responded that the ACE is taking place at present, but once the ACE is completed, Metro will ask FTA for permission to enter into PE. The request to enter into PE will be submitted to FTA this summer, once the DEIS/R document has been circulated to the public.

Ron Fong asked about cultural impacts to Little Tokyo, specifically impacts to Nisei week activities, and to minority and low income residents. Ray Sosa clarified that Metro has already identified the impacts to minority and low-income communities, and that mitigation measures will be identified to address project impacts.

Robert Volk asked about the entry point for the Tunnel Boring Machine (TBM). Dolores explained two potential locations (2nd Street and Central Avenue or 2nd and Hope Streets) would be reviewed as part of the study, and that both would be "environmentally cleared" for construction. Metro's Board of Directors would make a recommendation based both on the outcome of the technical reports and staff's recommendation regarding the final location of the entry point of the TBM. Robert stated his concerns about the cut/cover construction activity's impacts to 1st and Alameda Streets, and about the impacts of the TBM. Ray explained that typically turns using a TBM have been gentle, and that the turn needed at 1st and Alameda Streets is too sharp and shallow to safely use a TBM at this location.

Doug asked the LTWG to consider what Little Tokyo would look like once the project is in operation, including prospects for the future of the Office Depot site. He also wanted to know whether Metro has engaged any developers, or has any expectations for the property once construction is completed. Dolores explained that, during the DEIS/R, Metro is focused on the project alternatives and will not entertain any discussions about future development at the site. Ron then enquired about the status of the Office Depot site once construction is completed. Ray explained that any development at 1st and Alameda Streets would be a community-led decision.

Yukio Kawaratani emphasized that the future use of the Office Depot site should fit into the fabric of the neighborhood and specifically requested that the LTCC should have a plan in place once construction is completed. He would prefer to see buildings that meet the needs of the community, and doesn't want "Highest and Best Use" of the property.

A short discussion began regarding timing station construction with construction of any development that would be located at 1st and Alameda Streets. There would be a benefit to the community if the construction of the Regional Connector and any potential development at the current Office Depot site could take place during the same timeframe, rather than have ongoing construction for more than 5 years.

Satoro Uyeda owns a business on 1st Street and is concerned about the long-term construction impacts to Little Tokyo. He pointed out that it isn't just the actual construction, but rather perceptions about construction that impacts the community.

The Little Tokyo Public Safety Association has worked to change the public's perception of the neighborhood by addressing the perceived safety concerns. He observed that if an activity is scheduled to take place at or around City Hall, business that day tends to drop off noticeably. If people routinely hear that construction is taking place in Little Tokyo, or that construction on the Regional Connector has started, he is worried that they will avoid Little Tokyo entirely. He continued by pointing out that, while there may have been no loss of business on the Metro Gold Line Eastside Extension, many businesses are noticing they have new business owners next door.

Jason Yamaguchi wanted to know if more community meetings are scheduled. He's concerned that businesses along 2nd Street are unaware of the project, even though Metro contacted the owners. Chris Aihara reiterated she would like to see more concerted outreach to businesses along 2nd Street and that a community meeting would need to be scheduled for April. This meeting would take place before Metro's currently scheduled Community Update Meeting on April 14th, 2010.

Doug then provided an overview of next steps, including hosting focused stakeholder roundtable discussions, and a schedule of activities. He anticipates holding three roundtable meetings for Businesses, Residents, and Cultural/Religious stakeholder groups. Robert Volk suggested that Doug Kim meet with stakeholders before he reviews Metro's materials in order to make best use of his time. Kei Nagao suggested using the matrix as a starting point. Alan Kumamoto would like the group to complete a survey to understand the "hot topics" of most urgent concern to the LTWG. Doug offered to bring an action plan to the next LTWG meeting, and discuss the best approach to identify mitigation measures. The schedule depends on the availability of Metro's technical reports; there are 23 technical reports, some of which are only available in mid- April. Metro offered to assist Doug in any way with the community outreach effort. Dolores undertook to provide Doug with a copy of the Methodology Approach report, which will help the LTWG identify Metro's assumptions about the project.

The LTWG exchanged ideas about how Doug could best identify community concerns, identify potential mitigation activities, and how to convey information back to Metro. The group wants to be sure that that the schedule, is adequate to cover issues to be discussed so that a clear message can be developed.

Ann Kerman thanked the LTWG and LTCC for the letter sent to the Metro Board of Directors and CEO Art Leahy. The letter recognized Metro staff for their prompt attention and willingness to address Little Tokyo's concerns by adding a new fully-grade separated build alternative through the Little Tokyo community.

The meeting concluded at 8:00 p.m.

The next meeting will take place on March 18, 2010.

MEETING REPORT

Project Name: Regional Connector Transit Corridor Project

Organization: Little Tokyo Working Group (LTWG)

Date/Time: Thursday, March 18, 2010; 6 to 8 p.m.

Meeting Location: Japanese American Cultural and Community Center
222 S San Pedro St, Los Angeles

Project Team: Eric Carlson, Gerry Alvarez, Ann Kerman, Ray Sosa, Virginia Jackson, Helene Kornblatt, Kansai Uchida, Clarissa Filgioun, Ginny Brideau

Attendees: Chris Aihara, Edwin Barker, Kristin Fukashima, Darryl Garibay, Bobby Garza, Yukio Kawaratani, Chris Komai, Diane Tanaka, Alan Kumamoto, Joanne Kumamoto, Kei Nagao, Alan Nishio, Wilbur Takashima, Satoro Uyeda, Robert Volk, Bill Watanabe, Jason Yamaguchi, Evelyn Yoshimura

Action Items:

- Metro to consider extension for receipt of DEIS/R materials from the LTWG to April 29, 2010
- Metro and Doug Kim to provide introductory materials ("EIR 101") to LTWG for review by March 25, 2010 in preparation for the next meeting
- Metro and Doug Kim to present "EIR 101" as a portion of the April 1 LTWG meeting

Summary:
Chris Aihara called the meeting to order at 6:00 p.m., and led introductions of those in attendance. Chris reviewed the agenda, which focused on Doug Kim's presentation of the approach to the action plan and proposed calendar. Two changes were made to the March 8, 2010 meeting summary, correcting the start time to 6:00 p.m. and the FEIR availability date to Fall 2011.

Doug updated the LTWG with his work to date. Doug has reviewed 2 of the 7 technical reports available to Metro. He also anticipates hosting 3 stakeholder workshops prior to the end of April 2010, which would be focused on Business, Residents, and Nonprofit/Cultural/Religious stakeholders respectively. Chris clarified that community members will be encouraged to attend the workshop that best fits their schedule. The first meeting is tentatively scheduled for April 22, 2010.

info@therobertgroup.com

Chris discussed the efforts of the Consultant Task Force (CTF), and the amount of time taken to review the first 2 technical reports. She is concerned the LTCC will not have enough time to review, digest, and seek community input regarding the remaining 16 technical reports not yet available from Metro (there are a total of 23 technical reports). On behalf of the LTCC, she requested Metro allow the LTWG an additional two weeks to April 29, 2010 to deliver their document regarding the candidate mitigation measures for the Regional Connector Transit Corridor project. Regardless of Metro's ability to extend the deadline, the LTWG would be unable to have the document approved by LTCC for submission ahead of the April 27, 2010 general meeting.

Doug explained that the final two technical reports would not be available until the week of April 5th and that anticipated community stakeholder meetings would not be held until mid-April, hence the additional time requested. Many of the LTWG asked Metro to identify the potential ramifications of extending the due date by two weeks.

Eric Carlson identified the concern from Metro's perspective that the community stakeholder meetings would not take place until all of the tech reports had been reviewed, noting that the review of the tech reports was intended as supplemental information and not as the main source of information for the mitigations. He provided some background about the current April 15 due date for materials from LTWG to be added to the Draft EIS/R. He explained that Metro is working with the Federal Transit Administration (FTA) to submit an application for funding the Regional Connector Transit Corridor Project. In partnership, Metro and the FTA have agreed to a "roadmap" or schedule by which documents and milestones would need to be completed. Funding for the Regional Connector would be dependent on the completion of the Draft EIS/R. In order to remain eligible for the upcoming funding cycle, Metro must submit the Draft EIS/R for FTA review by June 1, 2010. Working backwards, Metro's technical consultant is scheduled to provide a draft to Metro for internal review by May 1, 2010. To provide enough time for inclusion and review, the technical consultant should receive final comments from Metro and the LTWG by April 15, 2010 so that the current schedule can be maintained.

Eric reiterated Dolores Roybal Saltarelli's comment from the previous LTWG meeting that, should the LTWG be unable to deliver a document prior to April 15, 2010, it is not the final deadline for submission of requested mitigations from this community. He noted that the Final EIS/R (FEIS/R) will be the last opportunity to make changes to the candidate mitigation measures suggested for the project, and that the anticipated availability of the FEIS/R is Fall 2011. The FEIS/R will include a menu of mitigation measures, which will then become part of the Record of Decision (ROD) and ultimately the contract between the community and Metro. If additional mitigations are needed after the ROD is developed, Metro will work with the Little Tokyo community to address specific requests.

Various members of the committee noted that they did not think an additional two weeks was an unreasonable request given the timeline and also asked if it would be possible for Metro to accelerate some of the tech reports that were of greatest interest, such as the Transportation Impacts report and the Land Use report.

Eric said he would inform Dolores, Metro's Project Manager, that the committee needed two additional weeks to prepare mitigations, and that Metro would look to accelerate the key tech reports discussed (Transportation Impacts, Land Use.) It was noted that Dolores would be out of the office until Monday, March 22, 2010, and anticipated that a response from her would likely come later in the week. He also would ask Dolores to give priority to the more anticipated reports, such as those addressing environmental justice and transportation.

Many of the LTWG members were uncertain about the EIS process, and asked if Metro and Doug could develop a short presentation that covered the basics of the environmental process. This presentation would explain how the reports are developed, how EIRs are approved, and the next steps between now and construction. They also requested a short description for each technical report. Ann Kerman agreed that such an overview would be helpful, and that information would be developed and provided to the LTWG prior to the April 1 meeting.

Ahead of the next meeting, the LTWG will continue to review the technical reports as Metro makes them available. The Working Group will also discuss an outreach approach to generate interest for the upcoming stakeholder meetings.

It was also agreed the LTWG would also serve as the Urban Design "sounding board" for the conceptual urban design of the new Little Tokyo/Arts District station included in the Fully Grade Separated build alternative. The discussion for the new station would take place in May 2010.

Jason Yamaguchi asked Ann to check at Metro to ensure the well-being of the new trees located at the current Little Tokyo/Arts District station. He has noticed the trees appear to be dying due to lack of water.

The meeting concluded at 8:00 p.m.

The next meeting will take place at 6:00 p.m. on April 1, 2010.

MEETING REPORT

Project Name:	Regional Connector Transit Corridor Project
Organization:	Little Tokyo Working Group (LTWG)
Date/Time:	Thursday, April 8, 2010; 6 to 8 p.m.
Meeting Location:	Japanese American Cultural and Community Center 222 S San Pedro St, Los Angeles
Project Team:	Dolores Roybal Saltarelli, Eric Carlson, Gerry Alvarez, Ann Kerman, Ray Sosa, Virginia Jackson, Helene Kornblatt, Kansai Uchida, Clarissa Filgioun, Ginny Brideau
Attendees:	Edwin Barker, Bobby Garza, Mary Graybill, Doug Kim, Chris Komai, Alan Kumamoto, Joanne Kumamoto, Mike Okamoto, Johnnie Raines, Kim Tachiki-Chin, Wilbur Takashima, Satoru Uyeda, Jayson Yamaguchi, Vanessa Yee, Evelyn Yoshimura
Action Items:	• Metro to provide potential meeting dates to discuss the urban design of the new Little Tokyo/Arts District Station. • The Robert Group to contact the Little Tokyo Business Improvement District regarding their membership list.

Summary:
Wilbur Takashima called the meeting to order at 6:00 p.m. and led introductions of those in attendance. Diego Cardoso briefly joined the meeting to thank the LTWG members for their participation at the recent Metro Board meeting in support of the Regional Connector study.

Dolores Roybal Saltarelli, Metro's Project Manager, responded to the LTWG's request to extend the deadline to April 29 for submitting a response about potential mitigation measures in the draft environmental document. She asked the LTWG to submit its materials as soon as possible, and Metro would make every effort to include the group's input in the administrative draft of the document. She outlined the project schedule, noting that the release of the Draft EIS/R would take place between summer and early fall 2010, and would include a staff-recommended Locally Preferred Alternative (LPA).

Dolores then reviewed the operating plans for each project alternative under study. The original and ongoing intent of the Regional Connector is to provide direct access through Downtown Los Angeles respectively East to West from East Los Angeles (and in future the vicinity of I-605 freeway) to Culver City(and in the future Santa Monica) and North to South from Pasadena (and in future Azusa) to

Long Beach. She further explained that the Regional Connector would not provide direct East to South or West to North access.

Wilbur asked about the possible removal of the current Little Tokyo/Arts District station, and what its demolition might entail. Ray Sosa responded that it could take up to 3 months, and that the impacts of station demolition would be considerably less than what was experienced during construction. Dolores emphasized that the Metro Gold Line would remain in operation during construction, and that a final decision regarding the platform would be made separately from the study.

Noting that the Planning Commission had approved the Nikkei Center development plan earlier that day, Wilbur asked if there was an update on any communications that would locate the LT/AD station under that development. Dolores noted that her conversations with Mr. Kaji have focused on providing a station entrance at the Nikkei Center Development, rather than placement of the station box under that site.

Bobby Garza asked about the timing of the decision regarding the Little Tokyo/Arts District Station. Dolores explained that Metro has focused on the study of the project alternatives and will make a decision about this station at a later juncture, likely after the completion of Preliminary Engineering (PE). She reiterated, however, that the station would remain in operation until the opening of the Regional Connector.

Doug Kim, consultant to the LTWG, mentioned his conversation with Mr. Kaji, which took place earlier in the day. While they did not discuss the Planning Commission decision, Doug is aware that Mr. Kaji will meet with the project's investors to discuss the station location and passenger access. Dolores and Ray reviewed the limitations of placing the station box under the Nikkei Center Development, specifically that Metro would be unable to provide the North/South and East/West service should the station box be placed under this site.

Doug Kim presented a summary of the EIR process in the context of the Regional Connector. The primary focus of his presentation addressed the overall environmental process, the importance of this process, and how to provide the best input to Metro regarding the project. His presentation also provided additional background of the Alternatives Analysis, and how Metro could secure funding from the Federal Transit Agency (FTA). A complete copy of the presentation is attached to this meeting summary.

He added that a series of three workshops for the Little Tokyo community, sponsored by the Little Tokyo Community Council, are slated to take place in April. Workshops will provide the community with an opportunity to discuss potential impacts of the construction and operations of the Regional Connector.

The meetings will take place at the Japanese American Cultural and Community Center, on the following dates and times, and targeted to specific community interests:

- Business focus - April 21 at 3 p.m.
- Non-profit focus - April 22 at 4 p.m.
- Residential focus - April 22 at 6 p.m.

Meetings will be open to all in the community, regardless of the meeting's focus.

At the conclusion of the workshops, the LTCC will receive a recommendation from the LTWG regarding the candidate mitigation measures. The LTCC will meet on April 27, 2010 to hear the workshop report and to consider these candidate mitigation measures.

Ann Kerman informed the LTWG that Metro's outreach team would be available to assist with notifications for the upcoming focus group meetings. Metro is alos available to provide informational materials about the focus groups at the community update meetings taking place in mid-April. Wilbur would like to invite as many Little Tokyo stakeholders as possible to ensure that a wide range of voices are heard.

Ann reminded the group of the dates and times of the community update meetings. She noted that materials have been distributed through postal mail, email, placed on the Gold Line and local buses, and were distributed by hand. Additionally, advertisements were placed in Rafu Shimpo, Pacific Citizen, Downtown News, Garment and Citizen, and Pasadena Star News.

Satoru Uyeda suggested that Metro contact the Little Tokyo BID for their distribution list. Ginny Brideau will follow up.

Jayson asked whether Metro had an update on the status of the cherry trees near the Little Tokyo/Arts District station. Ann had been on jury duty and unable to follow up. She will check on this issue once she has returned to the office.

Ann Kerman noted that the Little Tokyo Urban Design Working Group would be tentatively scheduled for the April 29 LTWG meeting. Dolores needs to confirm the technical consultant's availability.

The next meeting will take place at 6:00 p.m. on April 29, 2010.

SCOPING INFORMATION PACKET

Project Description

The proposed Regional Connector Transit Corridor project would provide a direct link connecting several light rail lines in operation or in construction, including the Metro Gold Line to Pasadena, the Metro Gold Line to East Los Angeles, the Metro Blue Line to Long Beach, and the Metro Expo Line to Culver City. The proposed project would create a connection through downtown Los Angeles that would link the Metro Blue and Expo Lines termini at 7th Street/Metro Center Station (7th Street and Flower Street) to the Metro Gold Line at the Little Tokyo/Arts District Station at 1st Street and Alameda Street. With the implementation of the project, these four lines would share tracks and stations in downtown Los Angeles. The project corridor length varies slightly by alternative and is approximately 1.8 miles long.

Project Purpose and Need

The purpose of this project is to improve the region's public transit service and mobility. The overall goal of the project is to improve mobility within the corridor by connecting to the light rail service of the Metro Gold Line to Pasadena, the Metro Gold Line to East Los Angeles, the Metro Blue Line, and the Metro Expo Line. This link would serve communities across the region, allowing greater accessibility while serving population and employment growth in downtown Los Angeles.

Additional considerations supporting the need for the Regional Connector Transit Corridor project include: increased travel times and station overcrowding occurring due to multiple transfers required to traverse the project area; a project area that has many transit dependent residents; poor system connectivity that results in reduced system schedule reliability as current system expansions are completed; and investments within the project area could improve system-wide operations in regards to travel times and safety issues.

Proposed Alternatives

The Regional Connector Transit Corridor Final Alternatives Analysis Report (2009) prepared by the Los Angeles County Metropolitan Transportation Authority (Metro) identified four alternatives for further consideration in the DEIS/DEIR. The four alternatives include: a No-Build Alternative, Transportation System Management (TSM) Alternative, At-Grade Emphasis Light Rail Transit (LRT) Alternative, and Underground Emphasis LRT Alternative.

No Build Alternative

The No Build Alternative would maintain existing transit service through the year 2030. No new transportation infrastructure would be built within the project area aside from projects currently under construction, or funded for construction and operation by 2030 by the recently

approved Measure R sales tax. Bus transit service under the No Build Alternative would be focused on the preservation of existing services and projects. By the projection year of 2030, some bus service would have been reorganized and expanded to provide connections with the new rail lines; however, the transit network within the project area would largely be the same as it is now.

Transportation Systems Management (TSM) Alternative

The TSM Alternative would include the provisions of the No Build Alternative and add two shuttle bus routes from 7th Street/Metro Center station to Union Station, providing a link between the region's unconnected LRT services. One route would run along Grand Avenue and 1st Street, and one along Figueroa, Flower, 2nd, and 3rd Streets. The shuttle buses would use existing bus-only lanes, where available, and would be fitted with transit-priority signalization devices similar to those used on Metro Rapid. Stops would be located every few blocks so as to provide full coverage of the area. Each shuttle route would be one and one-half to two miles in length.

At-Grade Emphasis LRT Alternative

This alternative (**Figure 1**) would extend from the underground 7th Street/Metro Center Station, head north under Flower Street, surface to at-grade north of 5th Street, cross 3rd Street, enter Bunker Hill, and turn northeast through a new entrance to the existing 2nd Street tunnel. The alignment would continue along 2nd Street where it would split into an at-grade couplet configuration on Main and Los Angeles Streets (one track on each roadway) to Temple Street. Then it would head east on Temple Street and realign into a dual track configuration east of Los Angeles Street and join the Metro Gold Line just north of Little Tokyo/Arts District Station on Alameda Street. Due to the high volume of trains that would traverse the Regional Connector, an automobile underpass and pedestrian overpass would be constructed at the intersection of Temple and Alameda Streets to eliminate pedestrian-train and automobile-train conflicts.

There are two options for the configuration on Flower Street. For Option A, trains would transition to underground tracks after crossing 3rd Street and continue to a new underground station just south of 5th Street, then proceed to the 7th Street/Metro Center Station and arrive at the existing Metro Blue Line platform. For Option B, trains would arrive at an at-grade station after crossing 3rd Street, then transition to underground tracks near 4th Street to reach the existing Metro Blue Line platform at 7th Street/Metro Center station. In total, the At-Grade Emphasis LRT Alternative would add 1.8 miles of new double track to the light rail system.

In addition to the Option A and Option B Station configurations, other station locations would include a station adjacent to Bunker Hill, south of 2nd Street and Hope Street, and a split station using Main and Los Angeles Streets between 1st and Temple Streets.

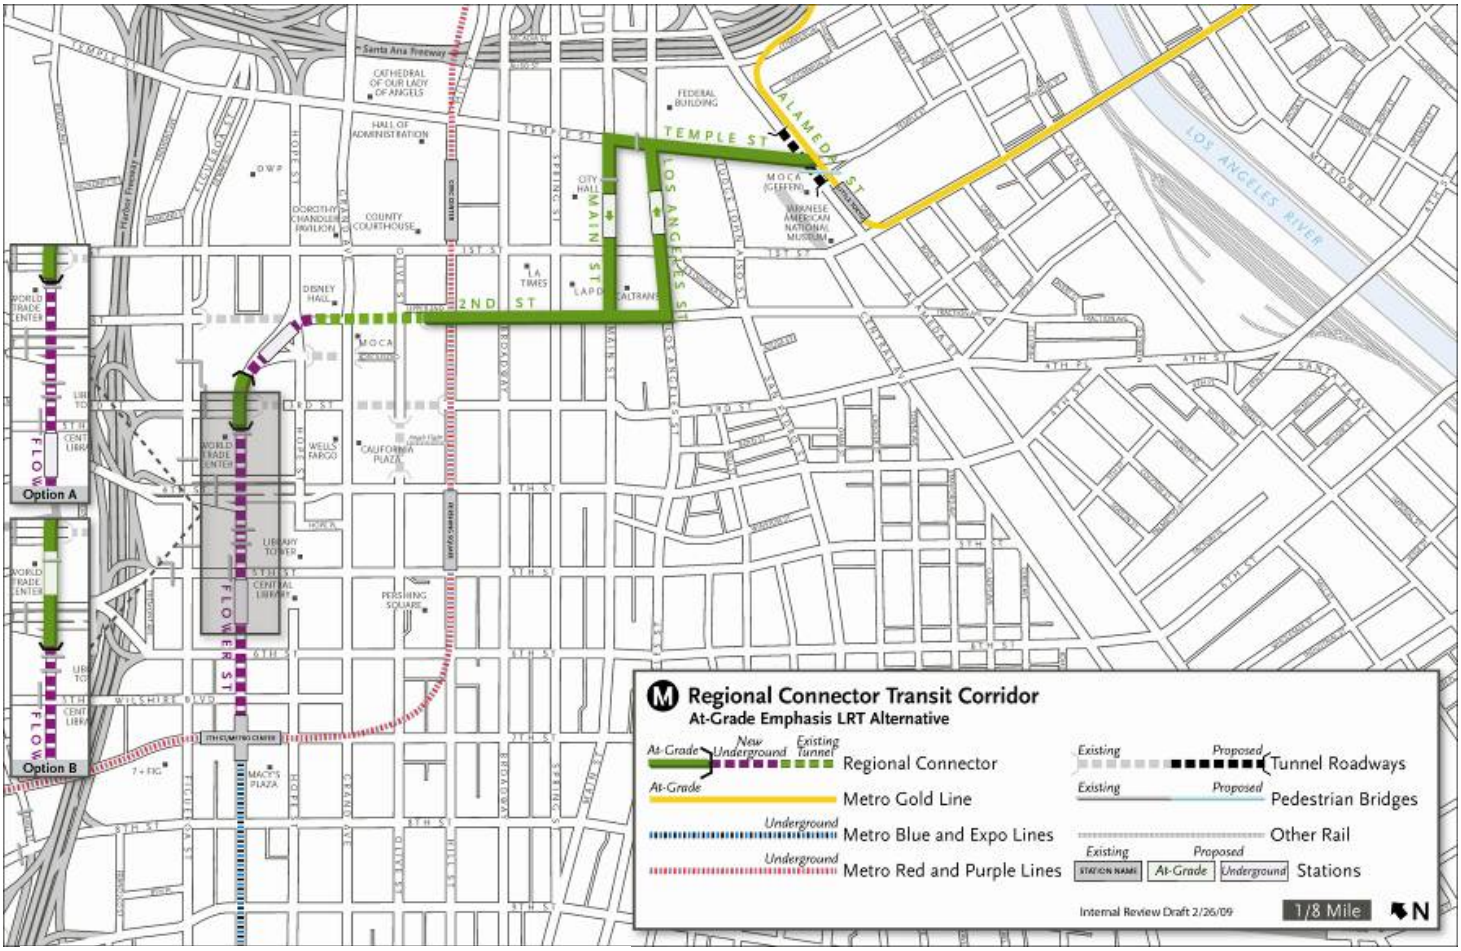

Figure 1: At-grade Emphasis LRT Alternative

Underground Emphasis LRT Alternative

From the 7th Street/Metro Center Station, this alternative (**Figure 2**) would extend north along Flower Street with a new underground station north of 5th Street. At 2nd Street, the underground tunnel would extend east with new underground stations to provide access to Bunker Hill and to the area between Los Angeles Street and Broadway. The tunnel would emerge to at-grade connections with the Metro Gold Line just southwest of the intersection of 1st and Alameda Streets. At 1st and Alameda Streets, a new underpass would carry car and truck traffic along Alameda Street below the rail junction, and a new overhead pedestrian bridge structure would eliminate most conflicts between pedestrians and trains. This

alternative would have a single at-grade crossing at the intersection of 1st and Alameda Streets. The rest of the route would be underground. The length of this proposed route would be 1.6 miles.

Station locations for this alternative would all be underground and include the area north of 5th Street on Flower Street, adjacent to Bunker Hill just south of 2nd Street and 2nd Street between Los Angeles and Main Streets.

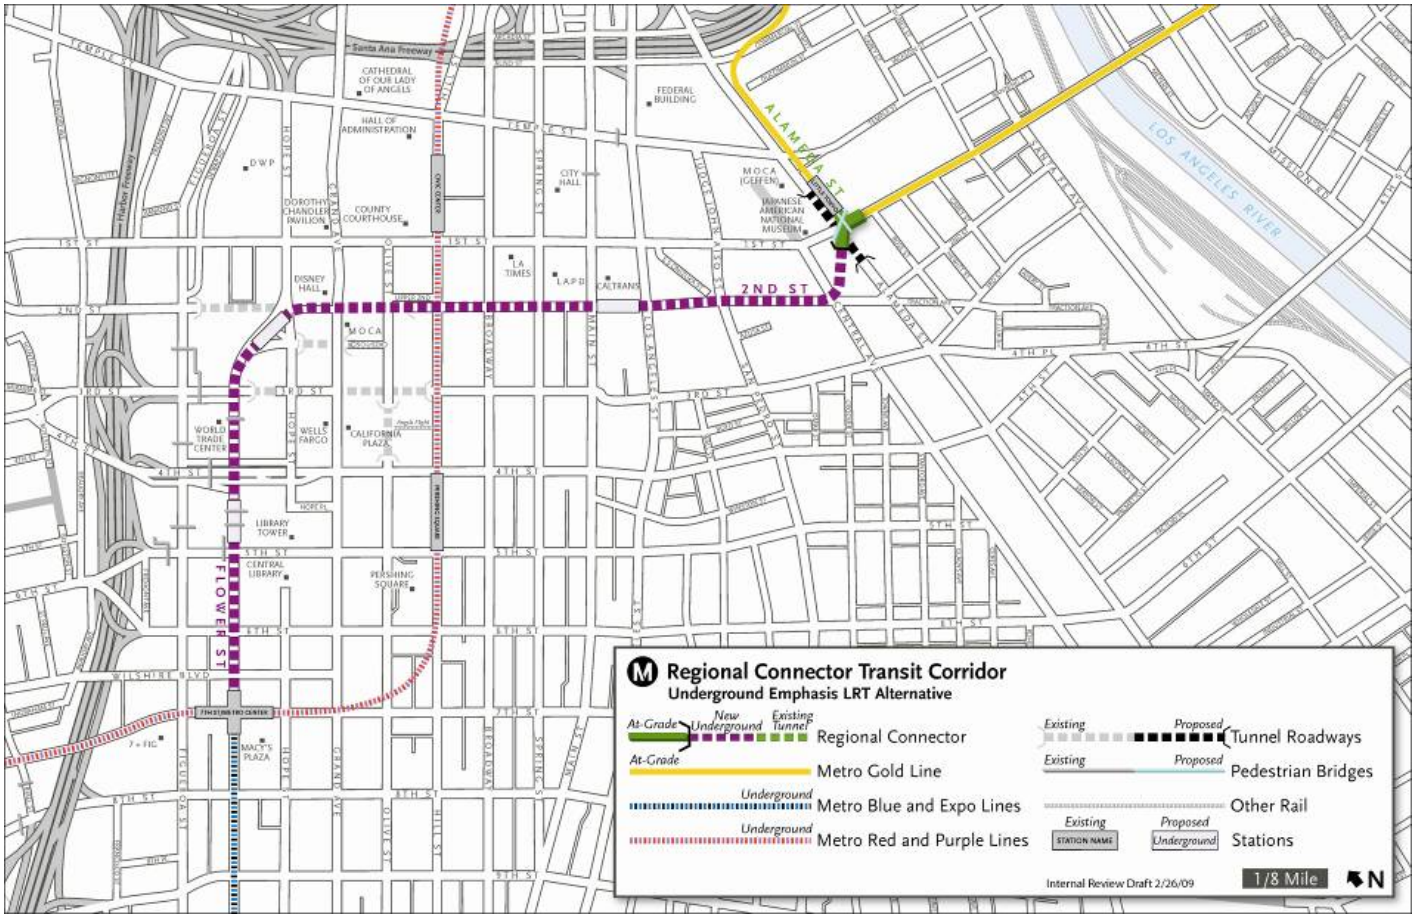

Figure 2: Underground Emphasis LRT Alternative

Preliminary Schedule

The preliminary schedule is provided below for discussion at the agency scoping meeting.

Action	Date
Agency Scoping Meeting	March 26, 2009
Public Scoping Meetings	March 30, 2009 to April 2, 2009 (see below for specific dates)
Scoping Comment Period Ends	May 11, 2009
Development of DEIS/DEIR	Spring – Winter 2009
Public Hearings/Comment on DEIS/DEIR	Spring 2010
Adoption of Locally Preferred Alternative	Summer 2010

What is an EIS/EIR?

An Environmental Impact Statement/Environmental Impact Report (EIS/EIR) must be prepared for all major projects that may significantly affect the environment. The EIS is prepared in compliance with the National Environmental Policy Act (NEPA) and the EIR is prepared in compliance with the California Environmental Quality Act (CEQA). The purpose of the EIS/EIR is to provide full an open evaluation of environmental issues and alternatives, and to inform decision-makers and the public of reasonable alternatives that could avoid or minimize adverse impacts and enhance the quality of the environment.

Scoping Meeting Schedule

Four public scoping meetings will be conducted by FTA and Metro for the public to learn more about the project and provide comments. The scoping meetings will be held at the following locations:

- Monday, March 30, 2009 from 4:30 p.m. to 6 p.m. at the University of Southern California (USC), Alumni Room, Davidson Conference Center, 3415 S Figueroa St, Los Angeles, CA 90007.
- Tuesday, March 31, 2009 from 6:30 p.m. to 8 p.m. at the Lake Avenue Church, 393 N. Lake Ave, Pasadena, CA 91101.
- Wednesday, April 1, 2009 from 6:30 p.m. to 8 p.m. at the Japanese American National Museum (JANM), 369 E 1st St, Los Angeles, CA 90012.
- Thursday, April 2, 2009 from Noon to 1:30 p.m. at the Los Angeles Central Library, Board Room, 630 W 5th St, Los Angeles, CA 90071.

Written comments will be accepted until May 11, 2009. Comments may also be submitted at the scoping meetings, sent via email to regionalconnector@metro.net, or mailed to:

Ms. Dolores Roybal Saltarelli, AICP, Project Manager
Los Angeles County Metropolitan Transportation Authority
One Gateway Plaza, Los Angeles, CA 90012

Subject: Regional Connector Transit Corridor

To whom it may concern:

As I am unable to attend the numerous “public scoping” meetings to give input on the proposed Corridor, I’d like to provide my perspective.

As a businessman who frequently travels in Los Angeles County I oppose any surface transportation being added to the already congested streets.

The corridor is not only essential; it is most welcome, and long overdue!

However, let’s keep in mind that the already overstressed streets and freeways cannot support any added transportation and that includes the Connector.

The Connector must be built underground.

Let’s keep the noise, the congestion away from our already congested streets and freeways.

Thanks for your careful attention to my input.

Lou Massicci, District Manager, K-12

Subject: Regional Connector

Regional Connector Proposal does not adequately serve the south and east edges of the plan area.

Increase Frequency of service on the 60 and 760 Bus line. No wait more than 12minutes 24/7.
This will serve 7th street, the south edge of the plan area.

Small, Frequent Shuttle Service from 7th to 1st should be studied. Attached is a quick sketch using google maps. Some arrows are incorrectly oriented. This blue loop, with 3 or 4 small shuttles running 24/7 would be an economic stimulus to the city.

comments:

To whom it may concern:
```

I am a resident at the Savoy Condominium Complex located on Alameda Street and 1st Street. As a resident, I am deeply concerned about the impact that the Regional Connector Project will have on our property and on our neighborhood. We who live in the Little Tokyo area have been enjoying a period of revival and development. It is area characterized by residential developments, small restaurants, shops, and speciality stores. It attracts people from across Southern California. However, the Regional Connector Project, in removing the businesses in the Office Depot block area and replacing it instead with heavy construction, and later continually running trains endangers the character of the neighborhood we live in and enjoy. Please inform me if I am wrong and take this view into consideration. Thank you.

Los Angeles, California 90012

Dear Chairman Najarian:

It has come to my attention the Los Angeles County Metropolitan Transportation Authority (Metro) has initiated an environmental process associated with development of a proposed "Regional Connector" project.

My office has been informed that the proposed route for the project includes the Los Angeles Little Tokyo community with the transit project potentially constructed adjacent to the Japanese American National Museum and the proposed Nissei Center project. The purpose of this letter is to state my strong interest in this environmental process being conducted by Metro, and its direct relationship to the integrity of the Little Tokyo community and the operational future of the Museum.

The Japanese American National Museum is the first museum in the United States dedicated to sharing the experience of Americans of Japanese ancestry as an integral part of the United States history. In addition, the National Museum was established in Los Angeles to preserve the rich heritage and cultural identity of Japanese Americans.

Currently, I have the honor to serve as a member of the Board of Governors of the National Museum. My close friend, The Honorable Norman Y. Mineta, former Secretary of Transportation is currently the Chairman of the Board of Governors. We both view the Museum as a national icon and a cultural cornerstone of the Little Tokyo community.

As Metro moves forward with the environmental process for the Regional Connector, I strongly urge the Authority to be responsive to concerns and ideas of both residents and businesses located in Little Tokyo. At the same time, please consider the unique characteristics and compelling historic significance of the Japanese American National Museum.

Further, I would greatly appreciate it if you would keep me fully informed regarding key milestones of this Metro managed project development process. If you have any questions about this communication or my request, please contact Lori Hamamoto of my staff at (202) 224-6628.

Thank you very much for your time and consideration.

Aloha,

DANIEL K. INOUYE
United States Senator

regional connector

I support the regional connector Underground Emphasis design and think it would greatly enhance the area of Little Tokyo by making it the crossroads for the entire Los Angeles light rail system. While construction may be disruptive to local business during construction, the outcome will be expanded opportunities for the Little Tokyo area, one of my favorite parts of Los Angeles.

comments:

This is the biggest waste of time, effort, and (potentially) money I have ever seen, especially seeing as Union Station is just around a mile up Alameda Street. The city of Los Angeles already has some significant money problems. If you are going to spend what we do not have, then how about you people get your collective head out of the clouds, get more train lines rolling and deal with our serious gridlock and traffic problems so as to create some actual PROGRESS?

comments:

THE UNDERGROUND IS PERFECT IN MY MIND EXCEPT FOR 3 THINGS=
1/ WHY NOT PUT THE ENTIRE 1ST/ALAMEDA INTERSECTION DEPRESSED AND LET
```

THE LIGHT RIGHT COME UP OUT OF THE TUNELL AND OVER THE ROADWAYS? KEEPS THE CARS AND PEDESTRIANS TOTALLY SEPARATED
2/ NEED A KNOCK OUT PANEL AT 2ND AND CENTRAL-- THIS PROVIDES A ROUTE SOUTH ON CENTRAL TOWARDS THE BLUE LINE. ALAMEDA TOO BUSY AND CENTRAL IS WIDE GOING SOUTH FOR THE FIRST MILE OR TWO
3/ LOS ANGELES/2ND STREET STATION IS BETTER FOR SPACING PURPOSES AND SERVING LITTLE TOKYO.. JUST PUT THE BOX ON THE WEST SIDE OF LOS ANGELES STREET WITH A EXTENDED UNDERGROUND PASAGE TOWARDS BROADWAY OR, ITS EASIER TO HAVE THE STREETCAR JOG A BLOCK OR TWO THAT TO MEET UP WITH THE LIGHT RAIL THAN TO MOVE AN ENTIRE LIGHT RAIL TUNNEL

TOO BAD THE DOWNCONNECTOR WAS NOT DONE FIRST, LOTS OF THESE PROBLEMS WOULD HAVE BEEN ELIMINATED !
-THANKS AND BUILD IT SOONER THAN LATER

Hello, Ginny,

I just received email from June Berk, and I found the minutes from Sep. 17, 2009 meeting regarding my comments during the meeting. I found what you have written in the minutes regarding my comments misleading, and does not reflect what actually took place. You must remember that I was a little agitated during the meeting because I have only learned of the Regional Connector project in our front yard, about 150 feet, only about two weeks before this meeting, all the time Metro has been doing the study in the past three years. Please make the correction to the minutes regarding my comments. The following is a more correct description of what took place.

Andrew Lin, a Savoy resident, protested during the meeting and said that he did not receive any notification regarding the Regional Connector Project by mail, nor over 300 residents of Savoy owners for the past three years while the Regional Connector Project was under study. "How can this happen?", he questioned. He stated that the "overwhelming majority of comments received supported the project" as stated in Executive Summary Final dated Dec. 2008 was based on 88 people's responses, and questioned how can this happen without notifying the Savoy residents by mails, while he has received Public Hearing Notices by mails to nearby residents within 500 feet radius in the past. He also questioned how can the Executive Summary arrive at the conclusion that Regional Connector is needed without mentioning any ridership from present or past years, and instead used projected figures from year 2030, figures 21 years in the future, to justify it. "The study is not a scientific study", he said.

Dolores Saltarelli stated that she is in contact with Lynne Collmann at Savoy. To which, Andrew Lin replied that he has spoken to Lynne regarding notification by mail, and both confirmed to each other that they have never received any notification by mail from Metro in past three years.

Washington, DC 20510

Dear Senator Inouye:

On behalf of the Los Angeles County Metropolitan Transportation Authority (MTA), I greatly appreciate your interest in the Regional Connector Transit Corridor Study and welcome the opportunity to respond to your specific concerns about the project's impact on the Japanese American National Museum and the Little Tokyo community.

The intent of our efforts is to improve the environment around the Museum, as well as public access to the Museum and Little Tokyo. In your position as a Board member of the Museum, your knowledge and sensitivities regarding the Museum and the Little Tokyo community are invaluable as we move forward in this transit planning process. Please be assured that MTA will continue to engage the Little Tokyo community in the planning process and be responsive to the concerns raised. Over the past six months alone, we have held 14 meetings/sessions with community leaders in Little Tokyo. We understand that that the Japanese American National Museum is not only a cornerstone of the Little Tokyo community, but also plays a vital role in the preservation of the rich heritage and cultural identity of Japanese Americans.

On January 22, 2009 the MTA Board reviewed and approved the Regional Connector Alternatives Analysis study and also authorized staff to enter the Draft Environmental Impact Statement/Draft Environmental Impact Report (DEIS/R) phase of the project. Four alternatives are currently undergoing an extensive environmental review, and the benefits/impacts of the alternatives are being evaluated. We are still in the formative stages of the planning and outreach process, and expect to have the DEIS/R completed by the summer of 2010. As we move forward toward that objective, we continue to engage in community participation efforts with all stakeholders throughout the project area.

Community participation is a key foundation of the DEIS/R phase. In addition to urban design workshops, ongoing stakeholder meetings and community update meetings, MTA has established a Little Tokyo Working Group to specifically address concerns from the community. Working with the Planning and Cultural Preservation Committee (PCPC), a subcommittee of the Little Tokyo Community Council, MTA has developed a framework to discuss cultural preservation, parking, the Alameda crossing and physical barriers,

construction phasing and methodology and exploring creative opportunities to support business during construction.

In closing, we believe strongly that in this challenging economy this transit project has the potential to reinvigorate Little Tokyo as a world class tourist destination, highlighting the continued relevance of this unique community as an integral part of the cultural and business fabric of Los Angeles County. I am pleased that MTA representatives had the opportunity to meet with your aide Lori Hamamoto on September 30, 2009 at your office in Washington, D.C. to discuss the concerns outlined in your correspondence and we look forward to continuing a close dialogue with you and your staff as the project progresses.

Sincerely,

Ara Najarian

Ginny,

I just read the Meeting Summary of Oct. 1, 2009, at Little Tokyo's JACC building. You have mentioned that I have requested Government guidelines regarding sending out notices. However, I also asked a question in the meeting which you seem to have missed. I said that according to my experience as a real estate broker for over 30 years, and involved in various development projects, I believe that it is a legal requirement to send out written notice by mails to the immediate community of the project. And I asked the question to Mr. Ray Sosa to confirm, but he said that he did not know.

Again, the following is a more accurate description of what took place during the meeting. Please make corrections. (I have copied a portion of the Summary regarding me. I am resending Sep. 17, 2009 Meeting Summary response to concerned people, including copy from the Summary regarding me.)

Andrew Lin stated that he is a real estate broker over 30 years, and is familiar with zone changes and legally required public hearings to nearby community of the project. He has worked with Goldrich and Kest, and other development projects. He read from the Public Hearing notice on one of the projects that was sent to Savoy owners from Los Angeles City Planning Department. The notice read, “TO PROPERTY OWNERS AND OCCUPANTS WITHIN A 500 FOOT RASIUS”. He said he believes that since the proposed project would generate about 22 trains per hour crossing the property, or 220 trains per day, that will constitute a major zone change, and requires written public hearing notices to be sent out by mails to the immedeate community, as required by laws. He asked the question to Mr. Ray Sosa because he has Urban Study degree, but Mr. Sosa said that he did not know. Other traffic count is as high is 44 trains per hour, or 440 trains per day, but Mr. Lin said he is not sure which is the accurate figure.
Oct. 12, 2009

Comments as typed by Ginny
Environmental Impact Report/Statement to date, including outreach to the Savoy. Andrew Lin requested information regarding NEPA and CEQA guidelines as it relates to public notifications.

Dolores Roybal Saltarelli, Metro Project Manager, briefed the Working Group on the purpose and need for the Regional Connector. She noted that the Red Line has historically been considered by Metro as an interim connector through Downtown Los Angeles, with the Regional Connector as a longer term solution. Further, as Metro continues to expand the Light Rail Transit (LRT) system, the 7th/Metro Center and Union Station will begin to reach capacity. The best way to address station capacity issues as well as the lack of connectivity between light rail lines is to remove the need to transfer at both stations. By removing transfers and by providing uninterrupted service through Downtown Los Angeles, the LRT system can serve more transit riders and station

Hello, Ginny,

Comments as typed by Ginny
Andrew Lin, a Savoy resident, stated that he had not received the project and meeting notifications Metro has distributed and asked what outreach to the Savoy had been conducted. He is also seeking additional information regarding the purpose and need for the project. He would like to review the projected ridership, and better understand the need for connecting at the Little Tokyo/Arts District Gold Line station.

Metro responded by promising to present a summary regarding outreach activities at both the Savoy Homeowners Association and next LTWG meeting.
The LTWG will review the at-grade emphasis alternative at the October 1, 2009 meeting.
There will be a breakout session dedicated to discussing impacts and potential mitigating activities

Subject: Downtown Connector Inquiry

Hello Ms. Roybal Saltarelli:

I have a few questions regarding the Downtown Connector project, specific to the "underground emphasis" alternative:

1. Please specify which portions of the guideway are currently envisioned to be cut-and-cover, bored tunnel and at-grade.

2. Please explain the justification for constructing the WYE at-grade as opposed to underground.

3. Please explain the justification for not considering moving the Little Tokyo from at-grade on the northeast corner of 1st/Alameda to underground on the southwest corner of 1st/Alameda.

4. What are the speed restrictions from Chinatown to Union Station, and Union Station to Little Tokyo.

5. What is the anticipated travel time between the Chinatown Station to Little Tokyo station, given the speed restrictions from Chinatown to Union Station, and Union Station to Little Tokyo.

6. Please provide the FTA standard cost categories breakdown.

Your prompt response is greatly appreciated.

All the best,

Hello, Ginny,

Please do not use the phrase “Savoy Participation” in your Regional Connector writings. The only meeting with Metro that Savoy ever had was on Sep. 29, 2009, all the time Metro was doing the Regional Connector project study since 2006. You were conducting study behind our back during the past three years, and you did not notify us in written mails all this time, when you should have done so from the very beginning of the study you are conducting. Yet, you have already conducted three “Public Meetings” in past three years.

The Savoy community found out about the project basically by chance and rumors recently. To show you how outraged we the Savoy community are, we collected more than 200 signatures opposing the project, within one month’s time. And I am sure you remember the master of ceremony, Mr. Alfred Chang, said at the end of the meeting in quiet and polite, yet resolute way that unless you, Metro, cancel the plan of First and Alameda, we will fight you all the way till the end. I believe that the community who can afford to buy such condominiums are all successful professionals in their businesses and experiences, and resourceful. I protest to the use of phrase “Savoy Participation”. Please do not try to mislead the public, and Washington DC.

You mentioned here that you dropped off 310 copies of flyers to Savoy Management Office on Oct. 26, 2007. However, I am curious, that is this the way you at Metro communicate with other people? Come and get it, and if you happened to miss to pick up the flyer, that is your problem, tough luck, because I already communicated with you? Savoy’s office is more than busy enough to handle daily chores for over 300 units. Besides, are you so simple minded to think that just simply dropping 310 copies of flyers means that you have communicated with all the Savoy community, and it becomes Savoy office’s responsibility to make sure that everyone gets the copy? So that you are relieved of your own responsibility?

The sure way is to send the notice by mails. It was, and still is, your responsibility to notify the immediate community of the project. Especially when you call the project of “Regional” magnitude, it is your responsibility to make sure that all the immediate community receive notices specifying Who, What, How, Why, Where, and When. When you consider more than 220 trains, or more, are going to traverse the property, don’t you think that you should alert the entire community to this fact? This project you call it a subway exchange HUB. Or maybe it is better to keep it a secret, for whatever the reason?

Can you tell us how may trains pass through Union Station each day? I am sure that Metro has an accurate account of the traffic.

Savoy condominiums building is more than four stories high, about 50 feet high building covering the entire city block, since 2005. One can not miss such a huge building unless one is blind, or does not wish to acknowledge its existence. Considering especially when it is about the same land size of the Project site, right across the street on Alameda Street, how could you, and all Metro staffs, miss the Savoy community all these years? The Project is your work day in and day out for over three years. You have chosen not to notify Savoy Community all these years. You have chosen to circumvent Savoy owners.

Ann Kerman apologized during the Sep. 29, 2009, meeting and said that she did not know how it happened this way that none of the Savoy owners received any notices. However, the damages you have already caused, and continuing to cause, to Savoy community is not something that you, Metro, can simply excuse yourself by saying that I didn't know what happened. This project is your work day in and day out, and you should know what is happening. And if you did not know, you should have known.

Please consider this fact. The project is your work, but this is our home, and so is to Little Tokyo.

Hello, Ginny,

Thank you, but an invitation to Gold Line ceremony will not be necessary. I am more concerned about the Regional Connector and its damaging impact it will bring to the community. I wished you have sent notice to me and all of the Savoy residents, and Little Tokyo community, about the Regional Connector when you started study about three years ago, just like you are sending me notice about the Gold Line.

I am just curious that when Metro built Gold Line, why have they not thought of connecting the Gold Line to what Metro is proposing now in the Regional Connector? If it is only 1.8 miles distance, why Metro did not Mater Plan it three years ago and synchronized everything before they built Gold Line? So why are you studying the Regional Connector for the past three years, while you are building Gold Line, and trying to connect Gold Line now through Regional Connector? And now you have just finished the Gold Line Extension. You could have done that three years ago altogether, is it not? It tells me that something is not right. It is either Metro made a big mistake in the Mater Plan, or the Master Plan was not a good one to start with. In either case, now you want us the local community to take the blunt of your mistakes.

How is the local community's response? We the local community is so outraged that Savoy community collected over 200 signatures against the project within one month's times since we learned of the project recently. And Little Tokyo collected over 300 signatures against the project within two months' time since they learned of the project recently. So there are over 500 people opposing the project, as of one months ago. Little Tokyo's signatures were presented to Metro's Board at the Metro's Board meeting on Sep. 24, 2009.

1. You wanted me to confirm to you that I have received two government guidelines when we were on the phone. So I acknowledged the receipt by email. Since then you have sent out Meeting Summary for Sept. 17, 2009 and Oct. 1, 2009 at Little Tokyo Cultural Center, and I have responded to those two summaries about what it said about my part, but you have not replied to me. Please send me the corrected summaries, as they were filled with mistakes the way they were written about my part.

2. Also please remove the phrase "Savoy Participation" from your writings, because there were never any Savoy Participation in past three years. It is obvious that Savoy owners could not have participated at all, even if we wanted to, because none of us were ever notified by mails, and we never knew that you were conducting study for the past three years,

until we learned of the project from rumors.

3. I also requested statistics on Union Station's daily train traffic, as I am curious to know how those number will compare with the Regional Connector HUB that you are trying to build. You are trying to sell to us that it is a very nice project. But we must politely say to you, "Thanks, but no thanks." More than 500 people have spoken, so far.

4. Also I am not able to find Mr. Ray Sosa's email. I tried to find his address in the Regional Connector internet site, but I don't see it. Can you please send me his email address?

Thank you for your attention to these matters.

Subject: Regional Connector : 1st/Alameda-Nikkei Center

Dolores,

Can you give me a confirmation if the project team has in fact re-introduced Underground Alternative 6 or 8 from the Alternatives Analysis into the study, per the request of the Nikkei Center developer? There are a couple of blogs that are reporting this as fact yet there has been no reply from any of the Regional Connector project team, It would be nice if this is the case, however some actual confirmation would be nice.

Here's the links:

As someone who rides Metro everyday from Union Station to downtown, I really wish you wouldn't put the connector so close to the existing lines.

Why not run from 7th and metro via 9th to the Garment/Flower district, have ONE stop there, and then continue on to the Little Tokyko station?

There is no shopping in downtown, save a couple of hotel shops and the Macys Plaza on 7th. But if people at the hub of 7th and Metro could hop over to the Garment District during lunch, the city's businesses would profit dramatically.

There just isn't enough to draw one to the other areas - it's all bars and restaurants, or nothing.

Please, please give us some shopping access!

And please - run a line out to Glendale. I can get to Pasadena by Metro, but have to take Metrolink to get to Glendale, and even then, not to shopping. It's sad what I can't get to, and I'm a huge fan of Metro. Please, give us access to shopping places with CLOTHES, not FOOD.

I strongly urge the MTA to avoid displacing the existing businesses and decreasing the quality of life for those of us who live at the Savoy Condominiums. I think it would be cheaper and less disruptive to route the regional connector on/through the Parker Center property that will be vacated soon. The MTA could even consider creating a transportation village/retail center in tandem with the connector on that property instead.

Thank you for considering this opinion.

Subject: Letter: Little Tokyo light rail

To the editor:

I am very concerned about some NIMBY attitudes that I have recently noticed in Little Tokyo.

In just a few days, the much-needed Metro Gold Line Eastside Extension will open. At the same time, the MTA has been planning a Regional Connector light rail line, which will also help Little Tokyo. These two projects will help Little Tokyo remain a vibrant neighborhood by drawing in visitors to the area.

Unfortunately, this won't happen if NIMBYs prevail in the ongoing discussions with the MTA over rail transit. Already, the Japanese American National Museum and the Japanese American Citizens League have come out against the project. The Little Tokyo Community Council recently voted to oppose both of the MTA's options for the Regional Connector.

This decision makes no sense. It is quite reasonable to negotiate with the MTA and ask for changes to be made to the existing plans. There is nothing wrong with proposing new options.

However, to take a hard-line stance against the project forces the Little Tokyo community into adversarial position. It is close-minded and eliminates any chance for a compromise.

I would support an underground station at First and Alameda if it could be done without adversely affecting the Nikkei Center or the Nishi Hongwanji temple. However, I hope that Little Tokyo residents would be willing to consider the at-grade crossing if the underground route turns out to be not possible.

Subject: JACL-PSW Board Resolution on Metro Regional Connector

Dear Dolores and Ann,

Hello, this is Kristin Fukushima from the Japanese American Citizens League Pacific Southwest District. I believe I have met both of you a few times at the various LTCC meetings and working group sessions, and I'm sure you know my supervisor, Craig Ishii (Regional Director).

Our Board met about a month ago and passed a resolution regarding our position on the Regional Connector. It occurred to us that while many people in Little Tokyo have seen it, MTA might also be interested in hearing the thoughts and concerns of some of the community members. The aforementioned resolution is attached on this email for your perusal. If you are interested in pursuing further conversation regarding the resolution, please feel free to contact myself, either at this email or at

our office telephone (213.626.4471).

Thank you so much for your time! I look forward to continued dialogue with you all.

Best,
Kristin

A resolution of the Pacific Southwest District Board of the Japanese American Citizens League opposing the current Build Options presented by the Los Angeles County Metropolitan Transportation Authority for a Metro Regional Connector Build in Little Tokyo for the interest of community preservation.

WHEREAS, JACL's mission includes work to preserve the heritage and legacy of the Japanese American community; and

WHEREAS, the Pacific Southwest District is committed to community preservation for Little Tokyo; and

WHEREAS, Little Tokyo is a recognized historical Japanese enclave, and one of the last three remaining Japantowns in the United States; and

WHEREAS, the Pacific Southwest District find all the current build options proposed by Metro for a Regional Connector to be built in Little Tokyo unacceptable in their impact on small businesses, residents, community events, parking, and the longevity of construction; and

WHEREAS, the Pacific Southwest District recognizes and understands the importance of mass-transit, particularly for the county of Los Angeles, and therefore is interested in finding the best possible solution for both Los Angeles as well as Little Tokyo; and

WHEREAS, it is vital that a build option is offered that significantly contributes and promotes a prosperous and thriving Little Tokyo, particularly if Little Tokyo is asked to give up already scarce property; and

NOW, THEREFORE, BE IT RESOLVED that the Pacific Southwest District Board of JACL considers all options as put forth by Metro for a Regional Connector in Little Tokyo to be inadequate or a threat to the sustainability of Little Tokyo; and

BE IT FURTHER RESOLVED that should Metro proceed with a Regional Connector build in Little Tokyo, we understand that disruptions will occur, and therefore to diminish the burden of construction and its aftermath on the Little Tokyo community, there must be appropriate mitigations mandated such as:

a) Minimal disruption to businesses;
b) Minimal disruption to residents;
c) Minimal disruption to parking;
d) Minimal disruption to community events;
e) In the event of an underground or at-grade line built, an accompanying Little Tokyo station;
f) Minimal disruption to the Go For Broke monument,
g) Minimal disruption to the Japanese American National Museum;
h) Transparency from Metro throughout the process particularly around perceived disruptions, and for Metro to then work with community groups to find the best solution; and

BE IT FINALLY RESOLVED that the Pacific Southwest District Board of JACL believes it is imperative that there is a build option that would preserve a historical Little Tokyo and promote a vibrant and thriving community – be it a new one or a current option with proper mitigations.

Hello, Ginny,

I have sent my responses to what you wrote on the Meeting Summary minutes, and requested that you send me corrected minutes. However, despite my repeated requests, you have refused to do so. Since the letter I sent to you Oct. 12, 2009, a copy is attached belor, it has been almost one month already. I do not understand why you refuse to write minutes to reflect what took place during the meetings, actually a simple straight forward matter. Instead, you are using creative writing, and omissions, to paint totally erroneous pictures. This is misrepresentation of reality, and in addition it is done intentionally. When you consider that there were 60 to 70 people present at the meetings to witness what happened, your behavior is quite daring. This is a practice of deception, and a campaign of distributing misinformation.

It is somewhat like that of False Advertisement. However, in case of trying to raise money using these false and intentionally deceptive information, I think there are more serious terms for this kind of practice.

I have communicated with you long enough, and waited long enough. I have asked you face to face, again, at Japanese Museum on Oct. 27, 2007, when Little Tokyo Community Council voted on their resolution. Yet, to this date, you have not respected my requests. So I think that your intention is clear.

If I do not receive corrected minutes within a few days, I have no choice but to report the misconduct to higher authorities. I am sure that you are prepared to be accountable for your actions and take it consequences. It is not a small matter to present false information to Federal Government, and in addition trying to raise money from these false information.

Also, please tell me, tell us, where do you send these minutes to? In this day of financial turmoil on Wall Street, and resulting Great Recession we are in because of false figures and information Wall Street institutions gave, Congress, Treasury, and Federal Reserve Board are all calling for transparency in financial dealing and individual accountability. Shouldn't you at Metro do the same thing to us tax payers?

Andrew Lin Nov. 6, 2009

Ps 4. Also what happened to the minutes of Metro presentation at Savoy HOA meeting

on Sep. 29, 2009? It has been over one month but Ginny has not sent us anything. Of course you know there was a heated discussion during the meeting and Savoy community. It was more like a community outrage because Metro has circumvented Savoy, and Little Tokyo, for the past three years. This was the first, and the only presentation by Metro about the Regional Connector to over 300 owners at Savoy, during all these years of Metro's study. Nevertheless, minutes are to reflect what took place during the meetings. Nothing more. The lack of this Savoy minutes is conspicuous.

Subject: re: Meeting Summary of Sep. 17, 2009 and Oct. 1, 2009

Ginny,

I just read the Meeting Summary of Oct. 1, 2009 , at Little Tokyo's JACC building. You have mentioned that I have requested Government guidelines regarding sending out notices. However, I also asked a question in the meeting which you seem to have missed. I said that according to my experience as a real estate broker for over 30 years, and involved in various development projects, I believe that it is a legal requirement to send out written notice by mails to the immediate community of the project. And I asked the question to Mr. Ray Sosa to confirm, but he said that he did not know.

Again, the following is a more accurate description of what took place during the meeting. Please make corrections. (I have copied a portion of the Summary regarding me. I am resending Sep. 17, 2009 Meeting Summary response to concerned people, including copy from the Summary regarding me.)

Andrew Lin stated that he is a real estate broker over 30 years, and is familiar with zone changes and legally required public hearings to nearby community of the project. He has worked with Goldrich and Kest, and other development projects. He read from the Public Hearing notice on one of the projects that was sent to Savoy owners from Los Angeles City Planning Department. The notice read, "TO PROPERTY OWNERS AND OCCUPANTS WITHIN A 500 FOOT RASIUS". He said he believes that since the proposed project would generate about 22 trains per hour crossing the property, or 220 trains per day, that will constitute a major zone change, and requires written public hearing notices to be sent out by mails to the immedeate community, as required by laws. He asked the question to Mr. Ray Sosa

November 9, 2009

The Honorable Ara Najarian
Chairman
Board of Directors
Los Angeles County Metropolitan Transportation Authority
One Gateway Plaza
Los Angeles, California 90012

Re: Downtown Regional Connector
Second Motion from LTCC

Dear Mr. Najarian:

After further review of the options that have been presented to the Little Tokyo community on the Downtown Regional Connector by the Metro Planners, the Little Tokyo Community Council adopted the following resolution at the LTCC meeting on November 3, 2009:

MOTION

While supporting improving the public transit system for the City and County of Los Angeles, the Little Tokyo Community Council opposes the two build options as currently proposed by the MTA for the Downtown Regional Connector. We urge that MTA explore other options.

This motion is in addition to the motion that was approved by the Little Tokyo Community Council at the October 27, 2009 meeting:

MOTION

The Community Council is in favor of the further exploration of continuing the Underground Emphasis Option, which currently tunnels underground at 2nd Street by continuing tunneling under 1st and Alameda and providing Little Tokyo with a station under the present Gold Line Little Tokyo/ Arts District Station, subject to the approval of the Nikkei Center, LLC, and the Nishi Hongwanji Buddhist Temple, and protecting the integrity and property of the Nishi Hongwanji Temple.

"The Little Tokyo Community Council is a nonprofit 501(c)(3) which has 90+ member organizations whose mission is to ensure that Little Tokyo would be a viable center for the Japanese American community and the Los Angeles Downtown community. The Council shall work to create a vision of what Little Tokyo should be in the future and serve as an advocate on behalf of the Little Tokyo community."

The Little Tokyo Community Council, an organization of over 90+ businesses, nonprofit community based organizations, religious, educational and resident associations, hopes to continue working with the MTA in identifying a solution for the Downtown Regional Connector that would not only benefit the Greater Los Angeles area, but would also continue to grow Little Tokyo to be an economically viable partner in the City's future plans.

The Little Tokyo Community Council respectfully urges the Metropolitan Transit Authority to consider the above motions of the Little Tokyo Community Council

Thank you very much for your consideration.

Sincerely,

Bill Watanabe,
Chair, Little Tokyo Community Council

I'm glad to see that the MTA was able to find a way to build the regional connector underground at First and Alameda.

While I am concerned about the cost, I think that the newest proposal will provide Little Tokyo supporters with an alternative that we can stand behind.

I like the idea of an underground station at the "Office Depot" block and I am curious to see what, if anything will be built there. The neighborhood lacks open space and perhaps a pocket park can be placed there.

Comments/Comentarios/コメント:

- The underground alternative should incorporate a new development that would redefine the block, provide more parking and other street level uses.
- Why is it not possible to surface the tracks after the intersection (Alameda/1st.)
- Locate station where existing pedestrian activity is heavy.

Comments/Comentarios/コメント: I live at the savoy and would not have purchased this condo 3 years ago if I knew there would be 4 years of construction and a train running in front of my condo ≈900 times a day. If, however, an underground station will be built at 1st & Alameda, I prefer for there to be a park or park and shops on the metro station instead of a parking lot.

Also, It would be much better if the underground section (on Alameda) would extend through, passed 2nd street so that it would maintain a calmer atmosphere for the residents of Savoy and put more of the truck traffic in the tunnel as opposed to partially at grade.

Comments/Comentarios/コメント: (UNDERGROUND EMPHASIS) Alternative

I would prefer that IF the Office Depot is replaced with a Metro, it be replaced with either a PARK or a development (with shops, etc) or BOTH. But I would not like to have a parking lot.

Also, I prefer that the N/S underground tunnel doesn't come above ground between 1st & 2nd. It should stay underground between 1st and 2nd the whole

Antonio R. Villaraigosa, Mayor, City of Los Angeles
Gloria Molina, Los Angeles County Supervisor, 1st District
Michael D. Antonovich, Los Angeles County Supervisor, 5th District
Don Knabe, Los Angeles County Supervisor, 4th District
Zaev Yaroslavsky, Los Angeles County Supervisor, 3rd District
Mark Ridley-Thomas, Los Angeles County Supervisor, 2nd District
MTA Board of Directors

We, the residents of Savoy in Little Tokyo, represented by the Savoy Homeowners' Association, hereby oppose the MTA Regional Connector underground alignment crossing 1st and Alameda St. As a community of 500+ property owners and residents in 303 units facing this intersection, we stand to lose much because of this project: depressed property values during construction, permanent loss of businesses, increased traffic, and increased air and noise pollution from construction and trains, respectively. The extreme designs for the surfacing of the train and the intersection threaten our property and quality of life. We have already sustained three years of road closures and construction for the Gold Line Extension. We applaud the conventional and unobtrusive design of the Gold line route and welcome the addition of a new Metro station to our neighborhood.

The proposed underground alignment for the Regional Connector, on the other hand, would surround the building in yet another round of heavy construction and place trains running on TWO sides of our building, forcing residents to use a bridge just to cross the street. Our residents facing Alameda will see their views of LA street life forever altered by the presence of a hole going into the ground and trains surfacing every 1.30 minutes. Finally, the Regional Connector will create an artificial boundary effectively isolating us from the historic and significant LA community we are so proud to be a part of.

We understand the need for the Regional Connector, but we simply cannot accept this development in its present form; the impact on our community is too severe. We implore you and the MTA to find another way.

Sincerely,

The Residents of the Savoy

OPPOSITION LETTER

Attention: Antonio R. Villaraigosa, Mayor, City of Los Angeles
Michael D. Antonovich, Los Angele County Supervisor, 5th District
Don Knabe, Los Angeles County Supervisor, 4th District
Zaev Yaroslavsky, Los Angeles County Supervisor, 3rd District
Mark Ridley-Thomas, Los Angeles County Supervisor, 2nd District
Gloria Molina, Los Angeles County Supervisor, 1st District

We, the patrons, businesses and community members of Little Tokyo, hereby list our signatures below to oppose Metro Regional Connector's underground, or light rail project, which will run through our beloved community. The Metro Regional Connector is only a thoroughfare along 2nd Street and emerges onto 1st and Alameda. It offers no stops along the way. This will threaten long time established businesses, forcing closures and loss of jobs, due to 3-5 years of construction; as well as visitors and tourists seeking accessibility elsewhere. Many Japanese senior citizens who reside in Little Tokyo will not be able to cross the street safely. The Metro line will delineate resident's from their current lifestyle, which will segregate them from everyday shopping, community centers and temples/churches of worship. 2nd Street is very narrow and should not be allowed for Metro's proposed commuter transportation.

We ask that you and your constituents reconsider this project and find other routes that will not destroy our community.

We hereby oppose this project as presented below:

Subject: Comments on regional connector

I wish I were able to make one of the recent public meetings about the Regional Connector, but unfortunately my schedule hasn't allowed it. Hopefully, comments by e-mail are acceptable as well.

As a Westside resident whose commute involves passing through downtown, I'm obviously a great supporter of having this kind of connection.

But I was aghast when I looked at the project website and saw that the vision is to have Expo lines trains just miss passing through Union Station. This reminds me a little bit of the Monty Python sketch where someone is about to be executed by a firing squad. The commander gives the order to shoot, the guards shoot, and...in the next scene, you see the commander yelling at the guards "How could you miss?!!"

I can't think of a better way of subtracting value from the Expo line than to have it just miss downtown's main transit hub! You plan to spend $800 million to have trains from the Westside pass just near Union Station but not stop there? Is this for real???

Best wishes,
Allon Percus

I want to express my gratitude to Metro for quickly working out a new, underground solution to the connection of the Regional Connector with the Gold Line in Little Tokyo. The previous plans would work, but I think the new option would be worth the added expense for those of us in Long Beach and along the Blue Line.

I would further suggest that Metro study rebuilding the freeway bridge (limited to 15 mph speeds due to tight curves) with a new straight bridge over toward Hewitt Street, with the portal in the empty alley on the east side of the Dept of Water & Power lot. This will save two minutes of travel time for everyone going from the Expo Line or Blue line to Union Station or areas north. Over the next 50 years, those 2 minutes per person will add up to over a billion minutes of time saved, worth a couple hundred million dollars in my estimation. We should straighten the bridge.

This project could also be combined with the necessary run-thru tracks for Metrolink and High Speed Rail, which will have the be built in the same area anyway. The old curvy bridge could be retained for use by the new downtown street cars, for when new lines are extended north toward Union Station and Chinatown.

Hello, I was reading The Source blog about the regional connector and saw the revised concept for a wholly underground connection and station in Little Tokyo. First, let me say the concept is immediately more attractive and less cumbersome for the community. I understand the intent is to connect Long Beach with Pasadena and Culver City with East LA, so couldn't the existing Little Tokyo station be removed from the concept? I realize it may seem silly to remove a newly built station, but that is simply due to Measure R accelerating the regional connector construction. The current station was designed for the current route but becomes superfluous with a new underground station serving reconfigured routes. Wouldn't eliminating the current station reduce the width of the right of way and allow the portal to shift westward, reducing the need to acquire additional real estate? Wouldn't eliminating the current station then help reduce the overall cost of the updated connector concept? I look forward to your response. Thank you.

Hey,

After looking at the map here: http://thesource.metro.net/2009/11/19/new-regional-connector-concept-proposed-for-1st-and-alameda-intersection/ I got an idea that should save a lot of money. Why not have all trains coming from the blue/aqua lines stop at the little tokyo station. Then lines heading for Union Station will continue in their current direction and lines heading to east LA can reverse direction after making the stop. I understand you will need to have the engineer move to the other side of the train, but he should be able to do that while the train is stopped. Seems like it would cost a lot less to only build one junction instead of 2 and not have to make another underground station less than a block away. Thanks.

Go For Broke
NATIONAL EDUCATION CENTER

November 20, 2009

The Honorable Ara Najarian, Chairman, and
Board of Directors
Los Angeles Metropolitan Transit Authority
One Gateway Plaza
Los Angeles, CA 90012-2952

RE: Go For Broke National Education Center opposes Metro's
Regional Connector options through Little Tokyo as proposed

Dear Chairman Najarian and Metro Board:

Go For Broke National Education Center (GFBNEC) is a 501(c)(3) established by second-generation Japanese American or Nisei veterans of World War II. We have created and continue to add to a Hanashi Oral History archive, a collection of more than 1,000 interviews with Nisei veterans. Using these video oral histories as real-life examples for students, we have developed a curriculum for history and social studies classes and provide teacher training to a growing constituency nationwide, including California, Hawaii, Maryland, Washington, D.C. and Virginia. Our symbol is the Go For Broke Monument, a lasting reminder of the U.S. Constitution's guarantees of civil liberties to Americans of all races and ethnic backgrounds that stands in Little Tokyo off of Temple Street at Alameda near the Geffen Contemporary Museum.

GFBNEC has invested millions, including funding from Congress and the State of California, in the development and planning of a new Go For Broke National Education Center to be built adjacent to the Go For Broke Monument on Temple Street in the Little Tokyo area of Downtown Los Angeles.

The veterans and GFBNEC Board of Directors respectfully ask that the Los Angeles Metropolitan Transit Authority explore and develop a 5th Regional Connector option that will not irreparably damage the historic Little Tokyo Community. The veterans and GFBNEC Board of Directors also oppose both of Metro's preferred options as they have been proposed:

- Option 1 - underground to 2nd & Central, rising to cross Alameda at 1st Street, and
- Option 2 – traveling at grade or street level on Temple, crossing Alameda Street.

In community meetings, it has appeared that Metro prefers the 2nd Street underground Option 1. These options are two of four that Metro is examining through the Environmental Impact Report process but the project supervisor has publicly said he does not consider the other options to be viable alternatives because they are both no-build. As we understand it, the completed connector will carry a train every 2.5 minutes, one going in each direction every 5 minutes. Every other train would stop at the Alameda and 1st station.

ph/fax: 808-585-8484

www.GoForBroke.org

As it has been presented, Option 1 would enter Little Tokyo under 2nd Street and continue to Central Avenue where it would steadily rise to grade level on a diagonal track across the current Office Depot parking lot, crossing Alameda at 1st and connecting to the new Gold Line Eastside Extension. An elevated pedestrian walkway could be built over 2nd Street. Construction for four years or longer would have a tremendous impact on Little Tokyo businesses that are already struggling, residents in the Savoy apartments, the Japanese American National Museum (JANM), the Museum of Contemporary Art's (MOCA) Geffen Contemporary, Go For Broke National Education Center and countless other organizations and institutions. Little Tokyo has already experienced the negative impacts of Eastside Extension construction and by the end of November, will have regular train traffic along 1st to Alameda Street from East Los Angeles. This option would also cost the City of Los Angeles income by reducing the sales tax increment from the Office Depot, Starbucks and other retail affected by construction and Metro rail operations.

Option 2 at street level on Temple Street to Alameda would consume most of the parking lot area north of the Geffen at the corner of Temple and Alameda Streets for tracks and an elevated pedestrian walkway. The two sets of tracks would curve inward to the east from Temple toward the Go For Broke Monument, encroaching into the planned GFBNEC building site by 10 – 20 ft. Metro staff has said the LA City Department of Transportation could require more right-of-way for safety reasons but planners will not present connector plans to LADOT until an option is selected. The tracks would migrate into the middle of Temple Street before reaching the tinker toy parking structure and Judge Aiso Street. This street-level option would have detrimental effects on GFBNEC's plans as well as on the Museum of Contemporary Arts and its Geffen Contemporary, East West Players, the Japanese American National Museum, Art Park and more. Trains every two and a half minutes would make it impossible to hold concerts, movies or children's performances in the long-awaited Art Park and make it unlikely that buses filled with school children or 80 and 90-year-old veterans would be able to enter or exit from our new Go For Broke National Education Center on Temple Street.

Metro representatives have also said that Union Station is crowded now and the 7th Street station will become crowded when the Subway to the Sea is completed. Metro will then need an alternative station to accommodate its passengers. The time to plan for that is also now.

GFBNEC and other members of the Little Tokyo community have been advised that developers of Nikkei Center on the Mangrove property are open to discussion and negotiation with Metro for a 5th option that could involve extending Option 1 underground from 2nd Street and Central to the new Nikkei Center on the east side of Alameda, eliminating the need for two sets of rails crossing Alameda at 1st, and leaving the Office Depot block intact. With this option, Metro would build an underground station at 1st & Alameda under the new Nikkei Center rather than have trains exit a tunnel in front of Office Depot.

We support a transit link between the existing Gold and Blue Lines, the new Gold Line Eastside Extension and the Exposition Line, and we believe there are alternatives that will not irreparably damage our Little Tokyo Community. GFBNEC officials and members, like many residents and business owners in the Little Tokyo community, have traveled by rail in such cities as Tokyo, Osaka, Taipei, Singapore, Shanghai and other cities that have world-class transit systems. Japan's light-rail system is state-of-the-art. We urge the Los Angeles Metropolitan Transit Authority to move forward with a system that is as good as or better than the world's best rail

transit systems without destroying communities, dreams and generations of sacrifice and hard work in the process.

Sincerely,

Kevin Tamaki
Chairman of the Board
GFBNEC

Christine Sato-Yamazaki
President & CEO
GFBNEC

Metro Planning Staff:

I wish to commend you on your recent efforts with the Little Tokyo community to create the new proposal for crossing First/Alameda. The new proposed underground alternative(with rail in a tunnel under First/Alameda) is much better than the previous underground alternative, and it deserves to be included in the environmental process. The new proposal is superior because it results in fewer impacts on the area.

I live in Long Beach, and I am a dedicated user of (M) Rail. The Regional Connector is possibly the most important and critical project Metro can build. It is crucial that the Regional Connector be built soon and built right, for the success of the entire system.

Thank You,

Joel Covarrubias
Long Beach

I am writing in strong support of the recent full-underground option for the regional connector recently posted in the MTA blog The Source. A fully underground connection in Little Tokyo will provide an invaluable transit connection while preserving local business and the pedestrian scale of the neighborhood. Also, having an underground station to complement the existing Little Tokyo/Arts District Station will undoubtedly help to handle the large crowds that will pass through the regional connector, and provide for more train arrivals and departures in the same amount of time by effectively adding a second platform to the station. An excellent example of the convenience of multiplatform and timed transfer systems can be found in downtown Oakland at 12th St, 19th St, and MacArthur Stations, and a similarly convenient station structure for this vital inter-regional link will be highly efficient.

As an affiliate of the Centenary United Methodist Church just three blocks away, I look forward to the potential for a well-designed, convenient, and neighborhood-strengthening transit line to help continue to transform Little Tokyo in amazing ways. Thank you for responding to the concerns of the community and please keep up the great work in transforming our city and county for the benefit of all.

Chairman
Board of Directors
Los Angeles County Metropolitan Transportation Authority
One Gateway Plaza
Los Angeles, California 90012

Re: Downtown Regional Connector

Dear Mr. Najarian:

The Little Tokyo Community Council (LTCC) would like to thank the Metropolitan Transportation Authority's for its response to the Little Tokyo community by presenting for consideration a concept for the Third Build Alternative for the Downtown Regional Connector.

The LTCC adopted the following motion at its November 24, 2009 meeting:

MOTION

The Little Tokyo Community Council supports the further exploration of the concept of the Third Build Alternative as presented by the Metro Planners.

We respectfully urge the Metropolitan Transit Authority Board of Directors to adopt the Third Build Alternative as one of the options for the Metro Planners to further explore for the Downtown Regional Connector, as part of the EIR study.

We thank the Metropolitan Transit Authority for their consideration of the concerns of the Historic Little Tokyo. We look forward to working with the Metro Planners as they further explore the Third Build Alternative.

Sincerely,

Bill Watanabe,
Chair, Little Tokyo Community Council

"The Little Tokyo Community Council is a nonprofit 501(c)(3) which has 90+ member organizations whose mission is to ensure that Little Tokyo would be a viable center for the Japanese American community and the Los Angeles Downtown community. The Council shall work to create a vision of what Little Tokyo should be in the future and serve as an advocate on behalf of the Little Tokyo community."

The new fully underground concept is clearly superior. Make it so.

Someday you will have to do something about the tight radius curves at the 101 crossing. That will become a bottleneck.

Subject: little tokyo/art rail project vote

hi!

i vote for underground railing for above project. the project should be done
so the business shops's income from clients would be minimally affected.

good secruity system against usage of rail as a get away means from the low income
generated theives/criminals from area of east LA et. al must be also put in place regardless
of the rail passage chosen.

i like the idea of using an economical and modern rail to little tokyo from sierra madre
gold line station. the parking fee + gasoline costs $10 now to get there from my home
and i would go there more often with my mother for shoppings.

Subject: Go For Broke National Education Center's comments on Metro Connector 3rd build option

Dear MTA Planners:

Continuing the connector line underground through the intersection at 1st and Alameda is a step in the right direction. But there are still significant concerns with the plan and its impacts on the Little Tokyo Community. To revisit our vote, we did not approve this option as presented but rather, we approved encouraging Metro to develop it.

First, we believe it would be better long-term, and demonstrate greater vision and better planning for future transit needs, to locate the station on a lower level of Nikkei Center instead of on the Office Depot parking lot. Construction on this now vacant parcel will have less impact. A station there would be more convenient to City Hall and the Federal Building. It's close to the Arts District. And it's an easy walk for all of Little Tokyo.

Second, the taking of the Office Depot property and the years of construction on that parcel will not only impact residents of the Savoy but also all the surrounding businesses and organizations, including those across the street on 2nd and those to the west on Central. Elimination of the parking creates access problems for people wanting to go to one of the affected businesses. Ray explained the boring machine

constraints but I expect that another solution can be found.

Third, cut-and-cover construction through the 1st and Alameda intersection will again create a traffic nightmare. It will seriously impact Savoy residents, JANM and nearby businesses. And logistically, one wonders how the contractor is going to cut and cover under the new Eastside Gold Line tracks.

Fourth, the City of LA needs the sales-tax increment from the impacted businesses. The City and its services are already suffering. The economy may be improving but no government agency can afford to lose funding.

Most of us involved in the Little Tokyo Community are very comfortable with public transit and appreciate its convenience. Our experience is not limited to New York or Washington, DC, but rather, the majority of people in the community have traveled on systems in other countries, including Japan, the benchmark for public transit; Taiwan with its new high-speed rail running the length of the island nation and train stations under office towers and shopping centers; Bangkok where an elevated system runs above old, established parts of the City; Singapore where everything is bright, shiny and easy to use; and/or fast-developing Shanghai. In addition, may of us have also used public transit in Paris and other European capitals with old, established subway and rail systems.

We want to thank Metro for bring this option forward and for continuing to develop it.

Very best regards,

Mary Graybill

Ann,

I am very pleased with the outcome of all the community discussions which are condensed into your 3rd Build Alternative.
At the same time, I hope you would keep this on-going dialog with us throughout the whole project.
As we keep saying, our community is not so large and trying to put a big foot into small shoe could literally destroy our community.
Please advise your engineering team to bring all issues to us if any deviation from originally presented design may require.

Regards,
Mike Okamoto

Hello

I am a huge fan of the metro and love seeing the city get connected. I submitted in the past (aka The Crenshaw line years back) Glad to see my vision is coming to life.

I have drawn up a couple more lines to connect the city - making it more commutable by foot and transit. First off it would great to see the old rail that connected downtown LA to Hollywood again. Maybe now from Staples Center to Hollywood above ground would be great, but if NOT. I have two Future idea's for rails: starting from the Blue line as seen below:

Metro Regional (Optional Line) - Concept by Peter Ricci
This line is very needed in Los Angeles

Northbound Baby Blue Rail Line Extension: (Future Line Silver Lake/Los Feliz/Glendale)

Stations in order:

1. Can Start From Conceptualized Regional Connector (Map)
2. Grand Ave/3rd St (Courthouse, Moca)
3. Grand Ave/ Caesar Chavez
4. Elysian Park/Stadium Way (Dodgers Stadium)
5. Echo Park/Sunset Blvd. (Echo Park)
6. Glendale Blvd. /Sunset Blvd. (Echo Park)
7. Coronado St. /Sunset Blvd.
8. Silver Lake Blvd. /Sunset Blvd. (Central Silver Lake)
9. Santa Monica Blvd. /Sunset Blvd. (Echo Park)
10. Hollywood Blvd. /Sunset Blvd. (Los Feliz Theatre)
11. Vermont. /Sunset Blvd. (Connector to red line)
12. Vermont./Franklin Ave. (Central Los Feliz)
13. Los Feliz Blvd./Hillhurst Ave. (Shuttle to Greek Theatre)
14. Los Feliz Blvd. /Riverside Dr. (Griffith Park/Tennis courts/Pony rides)
15. Zoo Dr. (Zoo/Museum)
16. Colorado/Pacific Ave (Glendale)

17. Colorado/Brand Blvd. (Americana/Glendale Galleria)
18. Brand Blvd /Wilson Ave. (Downtown Glendale, Theatres, Shops)
19. E. Doran St. /N. Glendale Blvd. (Glendale Plaza Shops)
20. M. Verdugo Rd. /E. Glenoaks Ave (Glendale Plaza Shops)
21. M. Verdugo Rd. /E. Mountain St. (Glendale Community College)

Baby Blue/Orange Phase 2 Rail Line (Future Line Glendale/Burbank)

Stations in order:

Starting at:

1. Colorado/Brand Blvd. (Americana/Glendale Galleria)
2. Brand Blvd /Wilson Ave. (Downtown Glendale, Theatres, Shops)

Phase 2 Begins Here:

1. Brand Blvd /Milford St. (Downtown Glendale, Theatres, Shops)
2. Brand Blvd. /E. Glenoaks Ave (Glendale Plaza Shops)
3. Brand Blvd. / Pacific Ave (Glendale Plaza Shops)
4. Brand Blvd. /E. Grandview Ave (Glendale)
5. San Fernando Rd. /Sonora Ave. (Disney Studios/DreamWorks Studios)
6. San Fernando Rd. /Western Ave. (Disney Studios/DreamWorks)
7. San Fernando Rd. /E. Alameda Ave. (Shopping/Burbank)
8. San Fernando Rd. /E. Verdugo Ave. (Shopping/Burbank)
9. San Fernando Rd. /E. Magnolia Ave. (Downtown Burbank/Theatres/Mall)
10. San Fernando Rd. /Grinnell Dr. (N. Downtown Burbank/Theatres/Mall/high school)
11. San Fernando Rd. /Amherst Dr. (Downtown Burbank/Theatres/Mall)
12. N. Victory Place/W. Empire Dr. (W Burbank/Outlet Mall)
13. N. Buena Vista St /W. Empire Dr. (W Burbank)
14. N. Hollywood Way/Thorton Ave. (Yahoo/Burbank Airport)
15. N. Hollywood Way/Victory Blvd. (Burbank/Bus Connector)
16. Burbank Blvd. /Victory Blvd. (Burbank)
17. Burbank Blvd. /Cahunga Blvd. (Burbank)
18. Vineland Ave/Chandler Blvd. (Connector to Red line/Orange line)

Hope this helps in your planning: look forward to seeing this come to life as well in the NEXT 5 years or less.

Subject: regional connector

Dear Ms. Roybal Santorelli:

As a resident living on 2nd Street with his wife, and with a family member living on Santa Fe Avenue, I can tell you that we all three strongly support the subway option for the regional connector.

We very strongly oppose the grade level option. That would slow down the train to the degree that it would be next to useless. Why not just continue on the red or purple line all the way to Union Station and switch there to the Gold Line? It would be simpler and faster, and it would require only one wait for a train instead of two. The grade level option simply doesn't work.

In addition the grade level option will snarl traffic on 2nd even more than it already is snarled. And it is often gridlocked as is. If traffic is diverted, then the parallel streets will be snarled.

The grade level option is absolutely a non-starter. It would further alienate the public from public transit and from city government. A grade level train would predictably be underused and seen by everyone as a colossal waste of money and another governmental mistake.

The subway, on the other hand, will be a civic boon and amenity, and it will be much beloved. The added expense will be forgotten immediately. The amenity will be appreciated forever.

Please--a subway only for the regional connector.

Sincerely,

Steven Axelrod

Latest News

As we move into the second month of 2010, we would like to share some project updates with you. You may recall that Metro has, to date, studied four alternatives as part of the Draft Environmental Impact Statement and Report (Draft EIS/R): the required No Build and Transportation Systems Management (TSM) alternatives, as well as an at-grade emphasis alternative via Flower and; 2nd Streets with a couplet on Main and Los Angeles Streets, and an underground emphasis alternative under Flower and 2nd Streets crossing 1st and Alameda

Subject: RE: Metro Regional Connector Update

Ann,

Your changes to the options were understandable. From a law enforcement perspective we are completely supportive of changing the layout at 1st Street & Alameda to an underground station, with no at-grade crossing or underground passage of traffic on Alameda Street. Your challenge will of course be how to minimize disruption to the existing Little Tokyo operation and I am very interested in hearing how that will be phased into the construction schedule.

Thank you for the update,

Subject: RE: Metro Regional Connector Update

"Metro anticipates releasing the Draft EIS/R document during Summer 2010. The Draft EIS/R analysis will include a description of construction processes and potential mitigation measures. A set of public hearings will be scheduled to solicit feedback from the community regarding the findings of the study. The Final EIS/R will be available for community review during Fall 2011, where Metro will again solicit community feedback. The Final EIS/R will designate a Locally Preferred Alternative."

1. With formal addition of a new build alternative scheduled for later this month, do you think there's sufficient time to incorporate all required analyses of that alternative into the Draft EIS/R in time for a summer 2010 release? That seems optimistic.
2. If you're anticipating a Final EIS/R with designation of LPA to be released during Fall 2011, when would you look at the Metro Board formally approving the LPA? When would you look at engineering design commencing for the selected build alternative (the LPA)?

Dear Metro Staff --

The decision to include a fully grade-separated alternative is a very good one considering that most of Metro's light rail services will use that connector well into the future. It is money well spent.

The underground light rail stations can be made much more user-friendly by dropping the mezzanine level. Patrons will need to go half the distance down to catch the train, day-in, day-out, for decades. The "no mezzanine" design will require side platforms with ticketing at the same level, but outside the faregate array. The streets and sidewalks appear wide enough to allow this. There would also be construction savings from not having to go so deep (as much as 30% per station). This type of design is common in older US systems and in some cities in Europe. The only drawback is that people will have to use the entrance on the other side of the street to travel in the opposite direction, but that would be better, I believe, than having to drop down another level each trip.

Subject: Fully grade-separated alternative

This is a formal public comment on the inclusion of the fully grade-separated alternative.

I would like to express my strong support of the fully grade-separated alternative for the Regional Connector. I also fully support its formal inclusion into the Draft EIS/R. The connector should be completely underground - for the sake of safety, for the sake of efficient train operation, and for the sake of non-disruption of pedestrian and vehicular traffic at the ground level. We are building our city's future, and we should not build badly and cheaply.

Sincerely yours,
Yuri Popov, Ph.D.

The Arts District Business Improvement District (BID) spans 53 blocks of eastern Downtown Los Angeles, between Alameda Street and the Los Angeles River. Within its boundaries are 398 businesses employing 5,322 workers representing $611 million in annual sales. The BID is administered by the Central City East Association (CCEA), representing Downtown property owners for the past 25 years.

The Arts BID Board of Directors has been advised of the potential of a new conceptual alternative for the Regional Connector's First and Alameda Streets crossing, one that would be fully grade-separated. We urge Metro's Planning and Programming Committee to support this alternative so that it can be comprehensively studied as part of the upcoming environmental process.

Thank you for your consideration.

The new fully-separated alternative is quite superior and should be adopted.

If possible, when the Connector is being constructed the radius of the curve at the E Commercial crossing should be increased to allow faster operation.

I am not a clear about one thing re: the regional connector If i get on the blue line on long beach will i be able to go all the way to little tokyo without switching trains?

It's never clearly stated if the MTA will build an extension of the expo and blue lines to little tokyo or an entirely separate entity.

If people in culver city and long beach have to switch at 7th street AND little tokyo to get to pasadena then i see no reason to build the regional connector. It's as annoying as the Green line then.

Subject: Underground is the way to go..Comments on Regional Connector plan

I could not imagine there would be any alternative that DIDNT have it completely underground. First, there are so many segments of it that would be underground anyways, including its starting point at 7th/Metro. Second, this is a downtown area, there is enough congestion as it is, keeping it underground would keep the streets clear for cars and pedestrians without slowing both of them down including the trains. Third, it would make the trains run slower if above ground. Fourth, it would require running powerlines overhead (ugly in a downtown setting). Fifth, its more dangerous. Sixth and finally, think of the future...downtown will become more dense and populated eventually and an above ground line would make it worse. I am in full support of this line, but please please please keep it fully underground. About the additional price tag for it?...Dont worry about it, this is well worth it, because im sure that there would be so many complaints about an above ground system in the future during and after construction that it would have to be changed anyways.

Hello,

I will not be able to attend the Planning and Programming meeting tomorrow (Feb. 18), so I wanted to express my support for the new fully underground alternative and reject the at-grade options, especially at 1st Street and Alameda.

I am a resident of Little Tokyo and a frequent rail/bus rider and I completely understand the need for the Regional Connector, I just hope we can do it without destroying the Little Tokyo neighborhood, which, I believe, the at-grade options will do.

Please approve and implement the fully underground alternative into the Draft Environmental Impact Statement/Report.

This is what I have been saying all along that has been needed. You can not have the most important link in the whole light rail system have a very big deficiency- grade cross at Alameda.. Thank you for finally seeing the light...
-
The moving of the other station closer to Broadway is good, but remember , a street car line can jog a block or two...
-
THERE IS ONE ITEM I WOULD LIKE YOU TO CONSIDER=
Build a knock out panel at the new Little Tokio station at the Staples site so that a line can proceed down Central Ave to an eventually link to the Blue Line.. yes , I know it may be many years, but its so easy to build the knock out now for future use, as opposed to coming back years from now and try to figure out how to tie this line in. We do this too often and all the hassels of trying to get the ELA line to tie into the Downtown Connector is a good example of poor prior planning.. Don't make another mistake.This would allow trains from LAUS would stop at the new 2nd street/Alamdea station, then can head down Central (which is better than Alameda (too many trucks) and Central is wide as far down at 7 or 8th.. you could stop at 2nd, 7th, Olympic, then on to the Washington Street Blue Line Station...

Dear Planners,

I am unable to attend the Regional Connector Mtg. on 2/18/2010, but I would like to share some ideas/ suggestions about its structure and alternatives.

1) I vote for the proposed alternative; it allows LRT trains to continue to travel underground from under 2nd and Central through the intersection of First/ Alameda Streets, keeping the LRT fully grade separated

2) My first (1st) suggestion: Allow the Regional Connector to stretch from 'Tokyo/Arts Station' to the corner of 'Alameda/101 Fwy Station' and 'Alameda/Cesaer Chavez'. (That's the front entrance of Union Station Building/ and Foothill Transit signs).

3) My second (2nd) suggestion: Allow the Regional Connector to stretch from Alameda/101Fwy Station,>> then to Ceasar Chavez/Alameda Street,>> then to CasaerChavez/Main & Los Angeles intersection,>> then to Main/ 1st, >> then to RedLine-Civic Center Station, >> then to 5th & 6th/Flower LA Library Station. Thereby creating several new station and connections to other transportation vehicles.

4) My third (3rd) suggestion: Build aerial-lanes on freeway systems for LRT train only.

SIncerely,
*M. Porter

To the MTA,

I'm writing this email in regards to tomorrow's Planning and Programming Committee meeting on February 18th at 2pm. Unfortunately, I cannot attend because of my schedule. However, I would like to comment and express my support for the new fully-underground alternative as a resident of Little Tokyo.

I want to impress upon the committee how much the community has come together on this new alternative. In our eyes, the two original build options are simply NOT acceptable to the long-term planning of Little Tokyo. The size and scale of the project would tear this small community apart and have permanent affects on the surrounding area. We've worked very hard with Ann Kerman and the MTA project team the past several months because we recognize the need for the Regional Connector but don't believe it has to destroy Little Tokyo in the process. Having trains go BENEATH 1st and Alameda, a key intersection, would not only meet the needs of the Regional Connector but also minimize disruption to Little Tokyo businesses, cultural institutions, and residents.

I strongly urge that MTA moves forward with the community in mind. Please approve the inclusion of the fully-underground alternative to the DEIS.

Sincerely,

Paul Yeh
Chairman, Savoy Homeowner's Association MTA Committee
Member of GetFit Little Tokyo
Member of Little Tokyo Community Council

Subject: Regional Connector Comment

I am writing to express strong support for the full-underground option for the regional connector being considered as a build alternative for the DEIR. A fully underground connection in Little Tokyo will provide an invaluable transit connection while preserving local business and the pedestrian scale of the neighborhood. Also, having an underground station at First and Alameda to upgrade or replace the existing Little Tokyo/Arts District Station will undoubtedly help to handle the large crowds that will pass through the regional connector, and provide for more train arrivals and departures in the same amount of time by effectively adding a second platform to the station. An excellent example of the convenience of multiplatform and timed transfer systems can be found in Oakland at the 12th St, 19th St, and MacArthur BART Stations, and a similarly efficient and convenient station structure for this vital inter-regional link is essential.

I look forward to the potential for a well-designed, convenient, and neighborhood-strengthening transit line to help continue to transform Little Tokyo and Downtown as well as the greater Los Angeles area in efficient and environmentally-friendly ways that look after the community as well. Thank you for responding to the concerns of the community and please keep up the great work in transforming our city and county for the benefit of all.

Yusef Shafi

Subject: Regional Connector Comment

Hello,

I regret that I cannot make the meetings scheduled for Thursday, February 18, but I was called in to work at the last minute. I have been following the RC for quite some time, and metro has promptly responded to my inquiries. Thank, you.

I strongly recommend that the completely underground station and connection to the Goldline be included in the DEIS/R. As a resident of the Pasadena area, I believe the complete grade separation at the intersection of 1st and Alameda is most sensible and will bear out to be more practicable, even if at increased expense. The long-term benefits of grade separation will manifest in the near future as traffic at that intersection continues to increase with residential development. Little Tokyo will be saddled with neither a monstrous at-grade transfer station compromising the pedestrian character of the neighborhood nor the traffic delays and the associated increased pollution resulting from having too many vehicles of various modes share the surface plane of traffic. Existing and future storefront activity facing the street at ground level will not be hamstrung by confining sidewalk limitations. Commuters may be able to shave a few seconds off their commute by not having to slow at an at-grade street crossing and may be able to shave minutes by not having to walk as much distance in the transfer process, a byproduct of turning two separate surface platforms into one underground platform. It's a good idea. Let's run with it.

Sincerely,

John Gove
P.O. Box 2081
Irwindale, CA 91706

PS - Please start finding funding for that Hollywood to Westwood phase of the Subway. That segment will pay for itself in spades.

Hi,
I am very happy about this change in your plans for the Metro in
Little Tokyo.
I would attend the meeting but I have a jury duty commitment.
Thank you for listening to the community and for your consideration.
Sincerely,

Subject: Regional Connector in Downtown LA (Little Tokyo)

To the Concerned Persons,

I urgently propose that a fully grade-separated alternative at the Little Tokyo Station, be formally added to the Draft EIS/R at the Metro Planning and Programming Committee Meeting today, February 18, 2010. I regret that I will not be able to make this plea in person due to work commitments and obligations.

As an administrator, planner and architect of several decades standing, I have the good fortune to be part of teams charged with the planning, proposal, design and realization of numerous public serving building projects in Los Angeles, San Francisco and San Diego and other locations outside the US. In these past decades, I have lived in and traveled to many locations and my passion and admiration for rail transit always leads me to utilize this whenever and wherever this is available.

In my experience with rail transit, whether in Washington DC, in New York City or in London and Paris, a grade separated hub is proven to be the most efficient option in solving the problem of moving large volumes of people through rail transit hubs. Timed transfers and multiple platforms typically increase the attractiveness of the rail transit option for people looking to use their travel time effectively and spend their travel dollars for the best return on investment. It has the added benefit of not causing negative secondary effects, such as congestion, on the station surrounding areas.

It is essential that this option be the one selected in order to accomodate the character, the narrow streets and the expected crowds of travellers transiting thorough or otherwise utilizing the Litlle Tokyo station. It will also serve as an apt counterpart to the multi-level facility available at the other end of downtown LA, at Figueroa.

Thank you for your consideration of my suggestion.

My name is Barbara Bauza, owner at the Savoy Homeowners Association located at 1st and Alameda Street. My unit is #425 facing the swimming pool and every day we hear the metro going through even though we are on the inside of the Savoy complex.

I fully support the Little Tokyo Community Council in demanding to add the only community acceptable alternative to the study: a fully grade separated alternative that would put the tracks underground, removing the trains traveling at grade through our neighorhood, put the Little Tokyo station underground, and give us the opportunity for more park space.

In addition, take the other build alternatives out of the study and finally, have Metro staff to continue their close relationship with the Savoy Homeowners Association in order to address the construction and operations impacts of the Regional Connector project.

Thank you,

Barbara Bauza

From: Kenneth Hsu [mailto:kennthsu@gmail.com]
Sent: Wednesday, February 24, 2010 6:23 PM
To: Regional Connector
Subject: Regional Connector Project

To whom it may concern:

I am a resident of Little Tokyo. Since 2006, I have lived in the Savoy located on Alameda and 1st. I have enjoyed living in this area very much especially since it has been developing. It continues to draw businesses and residents. Before, I remember this area to be very run down and barren. I am writing to express my deep concern that the regional connector project will put all this development in peril. The alternative which places above ground trains through First Street into the current Office Depot parking lot is a threat, not only to the community in general, especially to fellow homeowners who have put their hard earned life savings into the Savoy condominium complex. For many like myself, who purchased their unit at the height of the housing bubble, the investment has been very difficult to sustain in the face of the current economic environment. Many fear that the years of construction that the connector would require will further destroy our investment. Furthermore, the neighborhood is developing into a nice, relatively quiet area where pedestrians can walk and enjoy shopping and eating in the Little Tokyo stores and restaurants. The regional connector threatens this character of the community by putting high volume train traffic through the heart of the neighborhood.

I implore you, PLEASE FULLY CONSIDER ALTERNATIVES WHICH WOULD NOT PUT TRAINS THROUGH THE HEART OF LITTLE TOKYO. I hear that there is a new alternative being considered which would be underground. While this may cost more to build, it would save money by saving a quickly developing community and Los Angeles attraction.

Sincerely,

Kenneth Hsu

To whom it may concern:

My name is Patti Berman And I am the VP of Outreach for the Downtown Los Angeles Neighborhood Council.

I appreciate the invitation to your meeting tomorrow, but I will be unable to attend. So, I just wanted to put in my two cents.

I want to put support strongly in favor of the fully grade-separated alternative for the Regional Connector. We are working hard to make downtown pedestrian and bike friendly. Keeping the trains below grade as much as possible fits into this model.

Thank you for keeping DLANC informed.

Re: Commendation & Appreciation

Dear Mr. Leahy:

On behalf of the Little Tokyo community, the Board of Directors of the Little Tokyo Community Council, an organization of over 100+ businesses, resident associations, religious and educational institutions and community-based organizations, would like to commend and thank the Metro Team for their hard work and efforts to develop the concept of the Fully Underground Alternative plan for consideration by the Metropolitan Transportation Authority Board of Directors for the Metro Regional Connector.

At today's meeting, the following motion was adopted by the Board of Directors:

MOTION

The Board of Directors commend and applaud the efforts of the Metro staff and the consultants for developing the concept plans of the Fully Integrated Alternative for the Regional Connector, for consideration by the Metropolitan Transit Authority Board of Directors.

The LTCC Board of Directors thank the Metro staff for listening to the concerns of the community; for creating the option specifically in response to the community's concerns by developing a conceptual plan that would clearly eliminate the at-grade train crossings at First Street and Alameda Street.

"The Little Tokyo Community Council is a nonprofit 501(c)(3) which has 90+ member organizations whose mission is to ensure that Little Tokyo would be a viable center for the Japanese American community and the Los Angeles Downtown community. The Council shall work to create a vision of what Little Tokyo should be in the future and serve as an advocate on behalf of the Little Tokyo community."

We wish to express our deep appreciation for the Metro Team's hard work and sensitivity to the community. In particular:

Dolores Roybal Saltarelli, Metro Project Manager
Ann Kerman, Metro Constituent Project Manager
Ray Sosa, CDM Consultants
Virginia Jackson, CDM Consultants
Ginny-Marie Brideau, Project Manager, The Robert Group
Clarissa Filgioun, The Robert Group

We are looking forward to continuing to work with the Metro Team on this option, which we hope will be added to the Draft Environmental Impact Statement/Report (Draft EIS/R) by the MTA Board of Directors.

Sincerely,

Bill Watanabe

MTA:

I will be unable to attend the Board meeting this morning, but wanted to make a brief statement for the record as a business person in Little Tokyo.

I am in support of the MTA continuing on with their study of the "All Underground/3rd Build Alternative" alternative for the Regional Connector. I am hopeful that the Board will vote to allow that study to move forward and become an official part of the options that are being considered by the MTA.

Thank you,

Hi Ann,

We spoke awhile back about the need for green space in the Little Tokyo area that would include a park for children. As you know, there are many young, growing families at the Savoy, Mura, and other condo complexes in the area. As an educator with over 20 years experience, I am concerned that the needs of children have been overlooked in the redevelopment of Little Tokyo and the Arts District.

Currently, many young couples who invested in this area (especially at Savoy) are now upside down in their mortgages; and are having to live longer in their units until the market turns again. This means that for the next 10 years, we will be seeing more young children in the area. This is good for the growth of the community, but with that growth, adjustments need to be made.

We need a safe place where children can play and young parents can congregate in the community. It should have green space, but could be carefully designed to include shopping and eateries. All parking should be underground. A japanese garden would enhance the area and create a welcoming place for the community to walk to. Efforts in design must be made to modernize and enhance the feel of the Little Tokyo/ Arts District community, and not distract from it.

I would be happy to get signatures, as there is growing interest and excitement about this proposal. We may also want to consider space for a preschool and/or creative arts charter school.

I would be happy to do the necessary preliminary work and present this request to the board meeting next month.
(I could come today, too, if necessary.)

Thank you for all that you are doing to listen to the concerns and needs of the community.

Respectfully,

Linda Blakeman

Previously I attended one of your meeting regarding the metro system and the regional connector transit corridor. I still feel that it is highly unwise to have a rail system to run on surface. With a higher density population in downtown the metro it will worsen the traffic. In Pasadena where I live the decision to have railroad crossing on street level it is worsen traffic backing up lines of cars on the boulevards and creating more pollution from the cars exhaustion. Reconsider your decision looking at the future.

Draft Environmental Impact Statement/
Draft Environmental Impact Report

APPENDIX II

CONCEPTUAL ENGINEERING DRAWINGS
Construction Staging Sites

The Fully Underground LRT Alternative – Little Tokyo Variation 1 and Fully Underground LRT Alternative – Little Tokyo Variation 2 are identical to the Underground Emphasis LRT Alternative – Broadway Station Option west of Central Avenue. Only the two drawings east of Central Avenue are included for the Fully Underground LRT Alternatives.

1.0 INTRODUCTION

1.1 TOOLKIT PURPOSE

This toolkit provides streetscape and station design guidelines for the proposed Regional Connector Transit Corridor Project. It emphasizes the station sites and structures and pays particular attention to design decisions affecting how the system fits within the existing downtown.

This document builds upon the Metro Regional Connector Urban Design Report and is based on an analysis and distillation of best practices gleaned from guidelines developed for other transit systems, in conjunction with recommendations arising from the team's evaluation of the specific context and requirements of this project.

These guidelines do not contain rigid requirements or numerous specific dimensions. Rather, they outline key elements and design objectives for transit-system design in relation to its setting. The elements of this 'Toolkit' are intended to be applied to the design of the Regional Connector Transit Corridor Project and to support the decisions that Metro makes in concurrence with existing City of Los Angeles plans and policies.

Consistent with these plans, the introduction of the Regional Connector is seen as an opportunity to improve the downtown pedestrian environment. By integrating its stations within the urban fabric, future development will be encouraged in a pattern that promotes walking, transit use, environmental stewardship and a sense of community.

1.2 GOALS & OBJECTIVES

▶REINTEGRATE DOWNTOWN INTO THE LARGER CITY CONTEXT

A downtown core that is accessible from anywhere in the city and active around the clock becomes a natural destination location for residents and tourists.

▶PROMOTE MULTI-MODAL TRANSPORTATION

Transit systems designed to be fast, affordable and visually appealing, provide the public with a welcome alternative to commuting by car.

▶PEDESTRIANIZE THE DOWNTOWN

Urban streets lined by mixed-use development, vibrant streetscapes and public spaces create safe and enjoyable pedestrian travel to daily amenities.

▶GREEN THE DOWNTOWN

Greenery adds interest, ornamentation and continuity between urban spaces, while performing a valuable role in the reduction of noise and air pollution.

▶ESTABLISH A SENSE OF PLACE

The concept of placemaking acknowledges and builds upon a neighborhood's unique character through its architectural mix and street-side atmosphere.

By integrating its stations within the urban fabric, future development will be encouraged in a pattern that promotes walking, transit use, environmental stewardship and a sense of community.

◀ Aerial of Los Angeles Today

1.3 LOCAL CONTEXT

1.3.1 HISTORY

Los Angeles' history of growth cannot be separated from its history of transportation. The two grew together, intertwining with and encouraging the growth of the other. The city's setting – a vast basin bordered by the Pacific Ocean, the mountains and the desert – permitted unbridled outward growth. This sprawl eventually led to an over-reliance on the automobile.

The city's use of rail, both heavy and light, has fluctuated over time. Rail travel enjoyed popularity in the 1900s, when the first five railways and the addition of the local electric railways (red cars) provided a number of commuter-rail options. However, in the mid-1920s the automobile made its debut and began to replace trains as the preferred mode of transportation. Freeway networks were built parallel to the first five tracks. Except for a brief period during World War II, the use of rail steadily declined. By 1959, only the Los Angeles to Long Beach Trolley remained but, two years later, it too ceased operations.

In the mid-1980s, after many failed attempts at introducing mass rail transit, the Los Angeles County Transportation Commission and Southern California Rapid Transit District began to reassemble the rail right-of-ways abandoned years earlier. Today, a radial network of rail transit lines once more serves the city. The Metro Rail system consists of over 73 miles of track.

The Regional Connector will increase commuter options, allowing transit passengers to access the Metro Blue Line, the Metro Gold line and the Metro Expo Line without a transfer from one system to the next. The Regional Connector will facilitate the integration of LRT, bus and passenger-rail service in the region, increasing the effectiveness of the entire mass transit system.

The Regional Connectors timing is right. The car culture that once typified North American cities – and particularly Los Angeles – is becoming a thing of the past. Increased awareness of the need to reduce greenhouse gases has prompted citizens to voluntarily carpool, cycle, walk and take public transit instead of driving. The simultaneous move towards controlling urban sprawl has sparked a renewed interest in the quality of urban life.

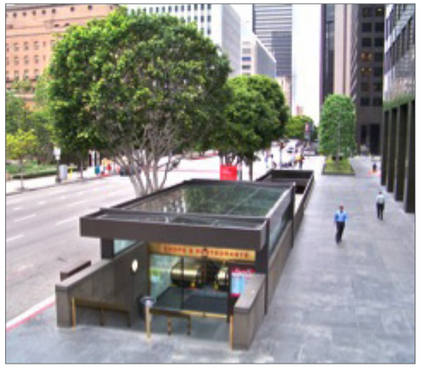
Downtown Los Angeles underwent its own recent overhaul with the introduction of major civic drawing points like the Staples Center, the Walt Disney Concert Hall and the Cathedral of Our Lady of the Angels. Plans underway, including the Grand Avenue project, will make the downtown even more of a destination. Already, this increased activity in the city center has made it a much more attractive place in which to live, work and play.

Another influence comes from Latin American urban design, which leans heavily towards lively urban plazas and pedestrian promenades. This influence in Los Angeles is further driving the move away from car culture and towards pedestrian culture.

1.3.2 CLIMATE

Los Angeles has a dry-summer subtropical climate characterized by 263 sunshine days per year on average and only 35 days of precipitation. The period of May through October is warm to hot and dry with average high temperatures of 74 – 84°F. The winter season includes minimal frost and lower temperatures that range from 73 – 48°F. The key to enjoying the outdoors in the city is the ability to escape from excessive heat and the occasional rain shower. Waiting areas and public spaces must offer escape from exposure to the sun.

Downtown Los Angeles happens to be one of the most favored climates in North America for the growing of subtropical plants. From a landscape architecture perspective, there is opportunity to provide protection from the elements with plant screens, walls and canopies.



◀ (Left) Financial District – Existing Metro Center; and (Right) 5th & 6th at Flower Station At-Grade

◀ Financial District – Existing Plaza

◀ Financial District – Existing Streetscape

1.4 DOWNTOWN DISTRICTS

The urban grid of streets and blocks throughout most of Downtown LA are based on a 'superblock' scale of generally 300' × 600'. The grid layout is inclined diagonally at a 26° angle off the cardinal grid of the rest of the city, following the original Spanish grid of El Pueblo de la Reina de Los Angeles.

The alignment has been subdivided into three major 'districts' within the downtown – the Financial District, Bunker Hill District and Historic Core / Little Tokyo District. These character zones will provide a 'jumping-off point' for developing themes and treatments for the streetscape. Please refer to Fig. 1 on page 7 and Fig. 2 on page 8, which illustrate all of the identified districts in downtown Los Angeles.

1.4.1 FINANCIAL DISTRICT

The Financial District extends throughout the lower and upper west Bunker Hill areas on the north and generally to Seventh Street METRO Center area on the south. The District is adjacent to the Harbor / Pasadena I-110 Freeway on the west and extends generally to Grand Avenue and beyond (see Fig. 1 and 2 for context).

The area encompasses more than 19 million sq. ft. in existing development, primarily high-rise office towers, hotels, the Los Angeles Central Library and Maguire Gardens Landscaped Art Park & Plaza, the Westin-Bonaventure Hotel / Conference Center and numerous existing high-rise office buildings surrounding the Fifth and Flower Street intersection, as well as the adjacent upper Bunker Hill concentration of office towers.

The segment of Flower Street, between Third and Fourth Streets, is flanked by the (±) 50' tall World Trade Center podium on the west and the (±) 60' tall Bank of America podium building on the east. Both podium buildings enclose parking garages and are internally oriented to vertical circulation cores with no significant street level pedestrian access, entrances or exits, along the length of the frontages of this segment of Flower Street.

Significant employment centers include the Bank of America Headquarters tower, the 444 Flower Street tower, the Westin-Bonaventure Hotel, the World Trade Center, the Marriott Hotel, the Figueroa Courtyard low-rise office complex and other job centers. Significant residential development includes the existing 990 dwelling units within the Bunker Hill Towers complex north of Third Street, and the 606 dwelling unit Promenade Towers residential complex, located at the NWC of Second Street and Figueroa, for a nearby residential total of 1,596 dwelling units.

1.4.2 BUNKER HILL DISTRICT

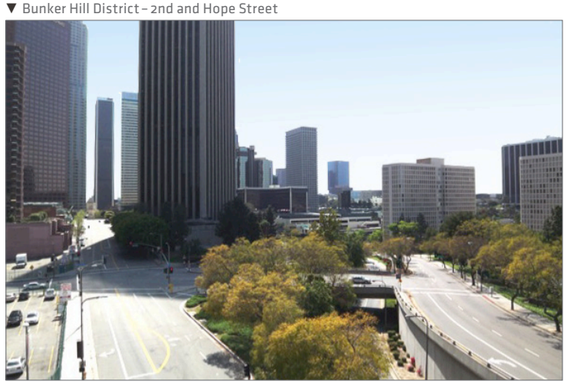
Significant cultural attractions in the immediate vicinity include Disney Hall, the Music Center with the Chandler Pavilion, Mark Taper Forum, Ahmanson Theater complex, the Cathedral of Our Lady of the Angels and the new Civic Park.

Major job centers include the LA Department of Water and Power Headquarters at the northwest corner of Hope and First Streets, the Los Angeles County Hall of Justice Courthouse, the County Administration Offices flanking the new Civic Park, the Colburn School of Performing Arts, MOCA, and Phases I & II of The Grand Avenue mixed-use office, residential, hotel and retail / entertainment development complex directly across Grand Avenue. Other nearby Bunker Hill employment destinations include the Bank of America Headquarters tower, the California Plaza towers, and the Wells Fargo Bank towers on upper Grand Avenue, all within a 5 to 6 minute walking range (see Fig. 1 and 2 for context).

With up to 2,660 dwelling units proposed for The Grand Avenue Project at build-out, the local residential neighborhood will include the existing 990 dwelling units Bunker Hill Towers residential complex, 391 dwelling units Grand Tower apartments, and the 217 dwelling units Museum

▼ Bunker Hill District – Disney Music Hall

▼ Bunker Hill District – 2nd and Hope Street



◀ Historic Core / Little Tokyo District – Existing Pedestrian Bridge

◀ (Left) Historic Core / Little Tokyo District – Existing Public Art; and (Right) Los Angeles City Hall.

Tower apartments near Second and Olive Streets, for a proposed total of 4,258 dwelling units, all within a 3 to 6 minute walking range of the proposed station.

1.4.3 HISTORIC CORE / LITTLE TOKYO DISTRICT

Within a 5 to 6 minute walking range to the north, the quarter mile radii along the second street transit corridor encompass approximately 80% of the Civic Center Federal, State, County and City Government employment centers and the related public destinations along the north side of First Street between Hill Street and Alameda Street.

This includes the site for a proposed new Federal Courts and U.S. Government office tower between Hill and Broadway, the L.A. Times / Mirror Square office buildings between Broadway and Spring, the new LAPD Headquarters building between Spring and Main Streets, the Caltrans Headquarters building between Main and Los Angeles Streets, the Kyoto Grand Hotel & Gardens complex, the Weller Court Shopping Plaza at the corner of Second and San Pedro Streets, approximately 80% of the Amended Little Tokyo Redevelopment Project Area (RPA) and the Little Tokyo / Arts District.

Also within a 5 to 6 minute walking range lie the proposed site of the 50-story, mixed-use Zen Residential Tower at the northeast corner of Hill and Third Streets, and the north portion of the Historic Core District, which includes numerous historic resources such as the Million Dollar Theater building, Grand Central Market, Angels Flight, the Bradbury Building and Biddy Mason Park, and proposed new buildings such as the Medallion Project, a 200 dwelling units mixed-use development at the southeast corner of Third and Main Streets.

Vibiana's Garden is located at the southeast corner of Main and Second and plans include the proposed Vibiana Place mixed-use development on the south side of the Vibiana property. The Vibiana site area also includes a proposed Little Tokyo Recreation Center on Los Angeles Street between Second and Third Streets. The Little Tokyo Branch Library is located at the southwest corner of Second and Los Angeles Streets, and represents the west gateway into the Little Tokyo Community RPA.

The quarter-mile radius around the proposed Little Tokyo Station includes the City Hall and Civic Center. Other predominant uses within Little Tokyo Station area are retail shopping, hotel and hospitality uses, international banking, financial and commercial offices, historic resources, temples, churches, cultural and institutional services, and most recently, a rapidly increasing number of medium to high-density residential and mixed-use infill development projects (see Fig. 1 / 2 for context).

The existing land use pattern within the original Little Tokyo RPA is largely a reflection of development that has occurred since 1970. Plans are in place to revitalize and preserve a mixed-use, full service community that continues to serve as the cultural, religious, social and commercial center of the Japanese American Community in Southern California.

In addition, the Little Tokyo Block 8 Mixed-Use Development (MXD) Project is presently in construction to include 750 dwelling units, with 50,000 sq. ft. of ground floor commercial space, 40,000 sq. ft. of landscaped open space and pedestrian paseos and parking for more than 1,000 cars, plus an additional 600 public parking spaces to serve the local area.

4.0

◀ Application of CPTED principles along retail high streets and TOD centers.

"A city is not buildings alone.
It is the spaces between that matter most."

–Prof. Jan Gehl, Life Between Buildings

2.0 DESIGN GUIDELINES

2.1 URBAN DESIGN

2.1.1 URBAN DESIGN PRINCIPLES

Great cities of the world are known not for their architecture alone but for the quality of their urban spaces – places where people willingly congregate to see and be seen. Urban design might, therefore, be defined as the art of forming connections between people and places, or between movement and urban form, within the Public Realm.

The underlying principles of good urban design focus on providing for the safety, convenience and comfort of the pedestrian in an environment that is lively and engaging, aesthetically pleasing, reflective of the local context, infused with meaning and historical relevance, economically viable and environmentally sustainable.

The Urban Design section of this Station Planning Toolkit sets forth a series of design principles and guidelines aimed at ensuring that the public spaces associated with stations deliver on their responsibility to contribute positively to the public realm. They are based upon best practices and / or industry standards from other similar projects, applied with careful consideration for the local context. At issue is the opportunity to use the advent of the Regional Connector as a catalyst to deliver quality urban spaces that contribute positively to a vibrant downtown.

Section 2.0 Design Guidelines deals both with Urban Design – a look at the broader context of the elements of urban placemaking and station design – with an understanding that their common ground is that the transit plaza surrounding each station entry can serve prominently as the center of neighborhood focus.

The underlying principles of good urban design focus on providing for the safety, convenience and comfort of the pedestrian in an environment that is lively and engaging, aesthetically pleasing, reflective of the local context, infused with meaning and historical relevance, economically viable and environmentally sustainable.

2.1.1.1 WALKABILITY & PEDESTRIAN ACCESS TO PUBLIC TRANSIT

To make an interconnected network of streets and sidewalks work, careful consideration of the interface between the automobile and the pedestrian is needed. Above all, pedestrians must be given priority and ensured safety to encourage the level of pedestrian use that supports transit. In this revamped model of priority, the following hierarchy should be respected in all planning activities:

- (1) Pedestrians;
- (2) Cyclists;
- (3) Transit; and
- (4) Automobiles.

2.1.1.2 COMMUNITY PARTICIPATION

Through consultation with residents and stakeholders, station area planning should accommodate a wide range of supporting benefits for local communities. Physical improvements to the public realm are insufficient on their own to create a truly lively, healthy urban environment. In addition, it is critical that the community be actively engaged by providing opportunities for public events and celebrations. The City of Los Angeles is exemplary in providing such opportunities, as evidence by the list of events contained in the Appendix.

To make an interconnected network of streets and sidewalks work, careful consideration of the interface between the automobile and the pedestrian is needed.

◀ Conventional Street

◀ Traffic Calmed Street

◀ Pedestrian-Oriented Intersection

2.1.1.3 SAFETY

Designing for safety is particularly important in transit areas where citizens are occasionally required to wait for extended periods, particularly in evening hours. The solution is to design the environment to optimize natural surveillance. The greater the pedestrian activity on the street, the safer the street is likely to be.

2.1.2 URBAN DESIGN COMPONENTS

2.1.2.1 BLOCKS

A grid-based street network is the fundamental building block of the urban environment and allows for a diversity of different street types and flexible lot patterns. At the heart of the grid is the block.

▶GUIDELINES

- Human scale blocks with shorter lengths are ideal to accommodate pedestrian travel.
- Provide a continuous network of pedestrian sidewalks and pathways throughout the station area connecting to surrounding neighborhoods and open spaces. This network comprises a variety of routes, enabling multiple user experiences and shorter travel distances.

2.1.2.2 STREETS & INTERSECTIONS

Streets are multi-functional spaces, designed for the safe, convenient and efficient mobility of all users – pedestrians, bicyclists, transit riders and motorists – in balance. Intersections must be safe and friendly to pedestrians and cyclists, but also allow for steady automobile travel.

The pedestrian, bicycle and vehicle realms should be clearly defined and separated to make negotiating intersections as safe and simple as possible.

▶PEDESTRIAN FEATURE GUIDELINES

- Reduce curb radii to the minimum possible to encourage lower turning speeds and to decrease the crossing distance for pedestrians.
- Extend high quality sidewalk finishes through the intersection, providing a strong cue to drivers that the crosswalk is part of the pedestrian realm.
- Locate pedestrian crossings at intersections, as close to natural 'desire' lines as possible to minimize jaywalking.
- Encourage mid-block crossings with curb extensions on blocks of more than 600' long.
- Maintain clear view corridors along streets connecting to the transit station and major civic landmarks.
- Allow signalization to favor transportation modes in the following order of priority: pedestrians, cyclists, automobiles.
- Orient street furniture, lighting, signage and landscaping towards the pedestrian.
- Avoid barriers as a means of controlling pedestrian flow as they create the feeling that the street belongs to cars first and pedestrians second. They reduce visibility for children and those in wheelchairs and give drivers a false sense of security.
- Street level pedestrian activities enhance the public realm and are the urban design priority for creating great streetscapes. In cases where pedestrian access requires grade separation with pedestrian bridges or underpass features, these facilities should be carefully designed to enhance pedestrian activity and safety and include pedestrian amenities such as joint uses, cafés and other retail amenities.

FIG. 3

TECHNICAL CONSIDERATIONS

▶TRAFFIC CALMING MEASURES

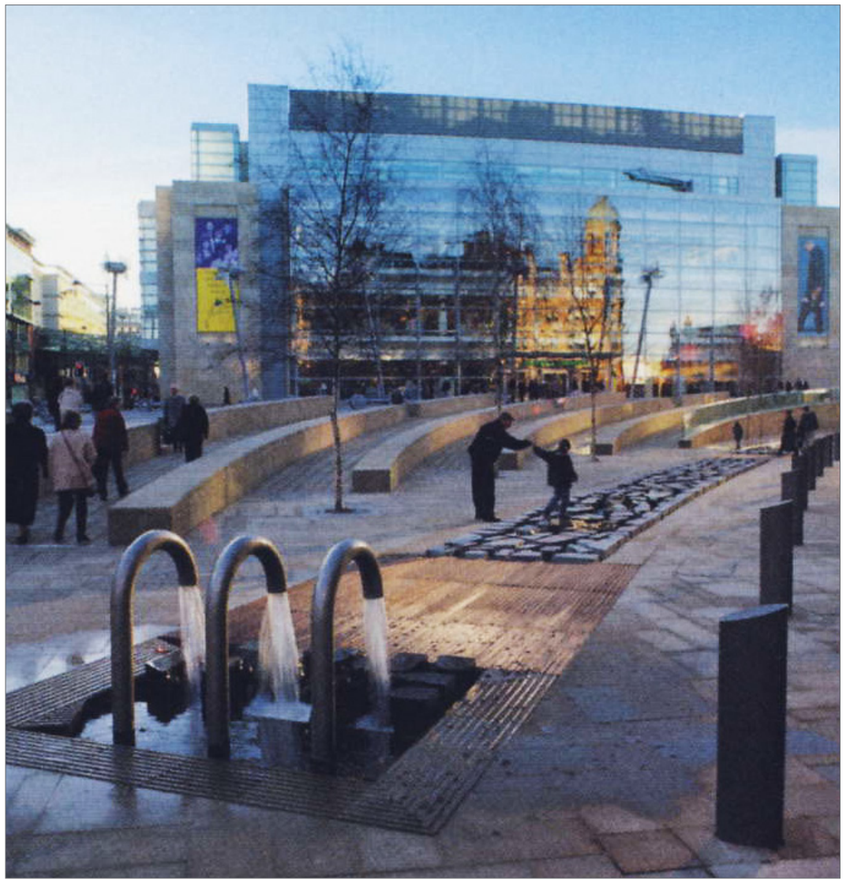
HORIZONTAL DEFLECTION

- Narrow Lanes (Less Than 12' in Width)
- Chicanes
- Mid-Block Extensions
- Traffic Circles
- Designated Bicycle Lanes

VISUAL CUES

- On-Street Parking
- Signage
- Regularly Spaced Trees
- Light Standards
- Banner Poles
- Medians

◀ Open spaces provide urban relaxation areas and places to interact.



◀ Architecture of adjacent building is oriented to the public plaza.

▶VEHICULAR FEATURE GUIDELINES

- Restrict traffic speeds to 30 miles per hour or less.
- Use on-street parking as a means to calm traffic. It provides a barrier between moving vehicles and the sidewalk and reduces the need for structured and at-grade private parking.
- Encourage further traffic calming through horizontal deflection methods and visual cues (see Fig.3 for details).
- Where possible, limit streets to a maximum of four lanes in width. Where the street is four lanes or greater, provide a center median with a pedestrian refuge.
- Create clear sight lines between driver and pedestrian. While it may seem counter-intuitive, reducing barriers and separations between cars and pedestrians, to a certain degree, actually forces drivers to be more cautious.

▶BICYCLE FEATURE GUIDELINES

- Connect local cycling routes to regional networks whenever possible. Bicycle lanes should be a minimum width of 5' and located along the outside edges of the street. Where designated bicycle lanes are not possible or desired, the vehicle lane closest to the curb should contain an additional 3' of width for cyclists.
- Locate bicycle stop lines slightly ahead of automobile stop lines at intersections to allow motorists to more easily acknowledge cyclists.

2.1.2.3 OPEN SPACES

A diversity of public places, including open spaces and civic uses, encourages social interaction and community participation.

▶GUIDELINES

- Place public parks, pocket parks and green spaces at intervals to situate downtown residents within a five-minute walking distance from inviting, usable open space.
- Comprise streetscapes of a variety of design elements – streets, sidewalks, building frontages, front yards. They create a pleasurable pedestrian experience and form the physical infrastructure of placemaking.

2.1.2.4 ARCHITECTURE

Architectural design of stations and related structures should be of high quality, carefully calibrated to respond to the local character of individual station areas and downtown neighborhoods. Individual architectural solutions are encouraged within the context of local character and compatible building massing.

Each station area should be developed as a unique environment, transforming a utilitarian transit node into a community gateway and a vibrant mixed-use hub of activity.

▶GUIDELINES

- Encourage properly conceived, strategically placed mixed-use development to combine disparate uses such as 'big box food stores and high-rise urban residential units' into single developments.
- Integrate transit stations with adjacent development where feasible.
- Where stations are in close proximity to, or integrated with, existing historic buildings, care should be taken to respect building character.

◀ Precedent – Underground Transit Station, Munich, Germany.

◀ Precedent – At-Grade Transit Station, Amsterdam, Holland.

◀ Station plaza's offer efficient pedestrian circulation and contribute to community life.

2.2 STATION DESIGN

2.2.1 STATION DESIGN PRINCIPLES

The principles described herein are to be applied in addition to Metro's existing design standards.

▶STATION IDENTITY

A station character that works in harmony with the local context will set the tone for future development. This character can be extracted by overall design, furnishings, signage and public art.

▶AMENITIES FOR PASSENGERS & NON-PASSENGERS ALIKE

Station areas should act as a community focal point for the station area, providing a meeting place whether or not the users arrived by public transit.

▶PATRON ORIENTATION

A system's smooth functioning relies on the ability of patrons to easily navigate a station both at regular times and in the case of an emergency. Unobstructed station access and thoughtful signage is crucial.

▶EFFICIENCY

Standardizing station components like electrical and mechanical systems and selecting materials designed to have a long life span promotes cost savings and environmental efficiency.

2.2.2 STATION DESIGN COMPONENTS

2.2.2.1 STATION PLAZAS

Transit stations should be designed not only for their primary function of travel to and from a community, but also as a center for community life. Station plazas are key components of the transit system, aiding in the development of a positive identity and providing a strong sense of place. They are key to providing good circulation and passenger flow in and out of the stations. Station plazas also facilitate wayfinding and orientation for users new to the system.

▶GUIDELINES

- Allow the station area to feature a generous, well-designed transit plaza to accommodate not only passengers, but also activities for the general public.
- Place transit stops near high-activity areas like high retail streets and public places.
- Encourage ancillary services, such as retail kiosks, in transit waiting areas to generate pedestrian activity.
- Facilitate the provision of public amenities and services, such as retail locations, information kiosks, seating areas, meeting places and event venues.

2.2.2.2 COMPLEMENTARY USES

Complementary uses are activities other than the transit facilities or their direct support facilities that provide additional services to patrons. They add security, amenity and identity to the station. These services can provide a profitable location for businesses and additional revenue for the transit system. They may include private facilities (convenience stores, day-cares, pharmacies, news stands, eateries) or public facilities (meeting halls, community centers, neighborhood parks).

▶GUIDELINES

- Conform complementary uses to all applicable and appropriate codes, local ordinances, regulations, standards and recommendations.
- Ensure that complementary uses are appropriate for the specific station location and provide needed services for the surrounding community.
- Design the façades of complementary uses to enhance the character of the site, to be compatible with the station architecture and to not interfere with the rail station's identity.
- Do not permit complementary uses to impinge on any station or site functions.

◀ Elevators increase accessibility to underground stations.

◀ Ramps are encouraged at all minor grade changes.

2.2.2.3 PROVISIONS FOR DISABLED USERS

People with disabilities, those 65 years old and older, the temporarily disabled and patrons with transitory conditions – the parent with a stroller, the expectant mother, the shopper carrying parcels, the traveller with baggage – must be carefully considered in station design. The specific issues that must be considered in facility design are orientation, horizontal travel, vertical travel, use of fare collection equipment, transfer from the platform to the transit vehicle and egress under emergency conditions (see Fig. 4). In most instances, provisions for the mobility disadvantaged fall within normal practice or existing code requirements. The majority of requirements can be incorporated through design at little or no additional cost.

▶GUIDELINES

- Ensure elevators comply with all applicable codes and standards.
- Clearly identify mobility-disadvantaged accessible entrances and other system elements, such as parking spaces, rest rooms and vehicle doors.
- Make all primary entrances to transit facilities accessible to the mobility-disadvantaged.
- Design circulation spaces that permit the unassisted movement of the mobility-disadvantaged through the facility, yet still integrate with general patron flow.
- Position and mount all equipment to which the public has access in such a way that wheelchair occupants can use the controls without assistance.
- Identify essential public facilities within transit facilities in a method appropriate for the blind and partially sighted.
- Ensure elevators, where employed, are accessible to the mobility-disadvantaged on the level that they use to enter the building, and at all levels normally used by the general public.
- Avoid potential hazards, due to abrupt changes in floor level, ground and floor surfaces and gratings.
- Identify platform edges by using a band of pavement at least 2' wide with a clearly contrasting texture and color. Tactile warning strips should be used to identify this potential dangerous area for the blind.

2.2.2.4 SECURITY & VANDALISM

Security and safety concerns the ability to protect the public from site hazards, prevent dangerous situations and guard against destruction of property.

▶GUIDELINES

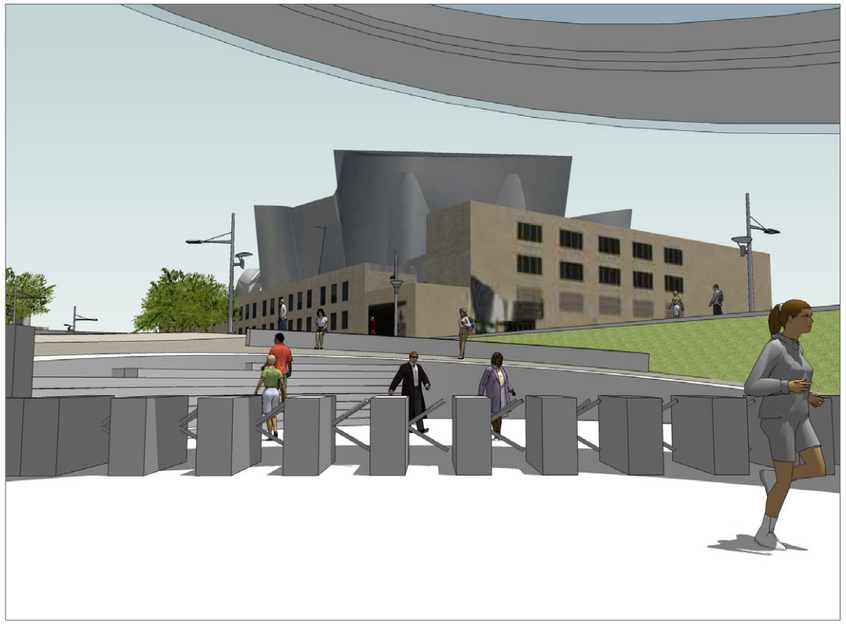
- Assign proper lighting to all areas of the site open to the public.
- Avoid designs with obstructions or 'hiding spots'.
- Identify and equip high security areas with appropriate security measures (fences, cameras, security personnel, etc.)
- Select design materials with reduced susceptibility to vandalism as well as those easy to clean, replace or repair.

FIG. 4

TECHNICAL CONSIDERATIONS

▶AREAS OF CONSIDERATION FOR THE DISABLED

- Parking
- Entrances
- Signage
- Grade Changes
- Protrusions
- Warning Systems, Both Audio and Visual
- Vertical Circulation
- Surfaces
- Guardrails
- Hardware
- Restrooms
- Control Buttons – Height
- Drinking Fountains
- Landscape / Pedestrian Zone Relationships



◀ Passenger circulation is easily understood and unobstructed.

◀ Adequate space surrounding vending and ticketing areas is necessary for efficient circulation.

2.2.2.5 HORIZONTAL STATION CIRCULATION

Passenger traffic is composed of two distinct groups: regular patrons and infrequent users. Once passenger flows have been established and the majority of patrons become familiar with the process, many directional problems will be eliminated. The initial goals should be to provide easily understood patron orientation, unobstructed access to and from station platforms and sufficient space to accommodate projected growth.

▶GUIDELINES

- Ensure pedestrian circulation is safe, easily understood and non-conflicting.
- Create station circulation systems that provide safe passage to and from the station platform and, in the case of a subterranean station, the mezzanine.
- Clearly label station entries.
- Encourage right-hand circulation patterns and the separation of passenger flows moving in opposite directions.
- Avoid cross-flow circulation and dead-end conditions.
- Ensure compliance with the National Fire Protection Association (NFPA) Standard 130 at exits.
- Provide a minimum of 7' – 6' clear at all platform edges.
- Include adequate space surrounding vending / ticketing areas as not to obstruct circulation.
- Provide a minimum queuing distance at high-traffic areas (see Fig. 5 for details).

FIG. 5

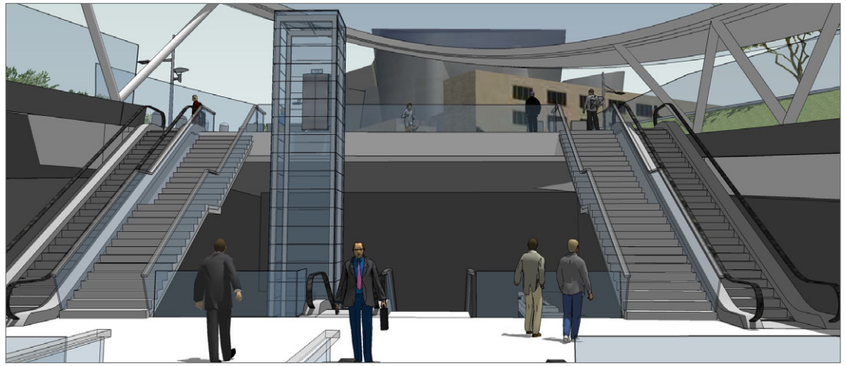
TECHNICAL CONSIDERATIONS

▶QUEUING DISTANCES

Provide the following minimum queuing distance at the following areas:

- Ticketing / Fare Vending = 8' – 0'
- Escalator = 20' – 0'
- Elevator = 12' – 0'
- Stair = 15' – 0'

◀ Safe and efficient vertical station circulation.



◀ Weather protected outdoor escalators.

2.2.2.6 VERTICAL STATION CIRCULATION

Vertical access to station platforms will typically be by stairs and ramps and, in the case of underground stations, by escalators and elevators as well. The priorities in designing a station's vertical components should be safety, convenience, accessibility for the disabled, security and ease of maintenance.

▶STAIR GUIDELINES

- Construct stairs of non-combustible materials.
- Use non-slip surfaces on treads, risers and landings.
- Include a trough to one or both sides of stairs to facilitate cleaning.
- Provide a ramp where a change in elevation is less than 18".
- Keep stair width to a minimum of 6' to accommodate:
  - » Opposite (up-down) flow of pedestrian traffic and a passing lane;
  - » Convenience for persons carrying packages and / or children; and
  - » Different anthropometric sizes.
- Conform stair elements to the guidelines outlined in Fig. 6.

▶RAMP GUIDELINES

- Construct ramps of non-combustible materials with a non-slip surface.
- Keep the ramp slope within the parameters of 1' in 20' (5%), with a maximum slope of 1' in 12' (8%).
- Ensure that the distance between landings does not exceed 30'. Requirement for railings, handrails and headroom are as noted for stairs in Fig. 6.
- Ensure a width minimum of 6' – 0" and a landing length of 5' – 0".

▶ELEVATOR GUIDELINES

- Employ only fully automatic, hydraulically operated models.
- Size interiors to accommodate wheelchairs, stretchers for emergencies and maintenance equipment.
- Ensure a rated minimum capacity of 3,500 lbs.
- Ensure controls that accommodate wheelchair-bound as well as sight and hearing impaired patrons.
- Locate elevators near parking for people with disabilities in stations with parking facilities.

▶ESCALATOR GUIDELINES

- Weather-protect any escalators that may be used outdoors.
- Provide escalators that are two speeds and reversible. They must be equipped with an emergency stop connected to the fire alarm system to enable an emergency exit route when stopped.
- Adhere to the following escalator dimensions:
  - » Width = nominal 48" minimum measured between balustrades and 27" above nosing of step treads.
  - » Slope = 30°
  - » Headroom = same as stairs (refer to Fig. 6 for details).

FIG. 6

TECHNICAL CONSIDERATIONS

▶STAIR FEATURES

TREADS & RISERS: GENERAL

- When parallel to adjoining escalator, tread to riser relationship should be a component of 30°.
- Ratio of riser to treads: 2R + T = 24 to 25 (where R = Riser, T = Tread).
- Tread and riser dimensions should be uniform in any one stair.

RISERS

- Maximum = 7".
- Recommended = 6 – ½".
- Limit number of risers in a single run to 18 at public stairs.

TREADS

- Minimum size = 11".
- Treads exposed to weather should have a 1% slope downward toward nosing.

▶LANDINGS

- Straight run stair minimum length = 4'.
- Return stair minimum length = width of stairs.
- Avoid concealed reverse landings.
- Ramp landing length = 5".

▶HANDRAILS

- Diameter = 1-¼" minimum to 2" maximum.
- Distance from wall = 1-½".
- Height from top of tread at nosing to top of handrail:
  - » Adult = 30" minimum to 34" maximum; and
  - » Child = 24".
- Continuous from top to bottom of stairs including landings. Locate on both sides of stairs. Extend 12" beyond the top riser and 22" beyond the bottom riser.
- Intermediate handrail required when width of stairway is over 88".
- Return ends to wall or turn down 90°.
- Grip surface to be uninterrupted by handrail supports.
- Handrails may extend a maximum of 3½" into width of stairs.

▶GUARDRAILS

If guardrails are not solid, any opening should be sized to allow a maximum of a 4" sphere to pass through.

▶HEADROOM

- Measured from perpendicular to the tread nosing.
- Public stairs = minimum of 7'-6".
- Service stairs = minimum of 9'-0".
- 9'-0" for maintenance (to avoid finger prints).
- Continuous soffits = 10'-0".

▶TACTILE WARNINGS

Locate before top and bottom risers. Start at a minimum of 24" from the stair nosing.

◀ Canopies shelter passengers from the sun and rain.

◀ Transparent enclosures increase visibility and security.

◀ Solar paneled canopies protect from the sun while harnessing its energy to power the platform.

2.2.2.7 WEATHER PROTECTION

Protecting the patron from exposure to extreme summer heat and winter rain and wind is a major factor in the architectural design of the station as well as in maintenance and security issues. Each station type has its own particular weather protective situations. The at-grade stations are more exposed and may need more extensive provisions for the patrons as well as for mechanical equipment. Underground stations will require protection at patron entries and for vertical circulation equipment such as elevators and escalators.

▶GUIDELINES

- Incorporate canopies into the station design as effective shelter from the sun and rain. They should slope to a drain or gutter and, as an additional sustainability feature, can be made to empty into a bioswale or water feature. Canopy design should fit with the surrounding architecture.
- Design enclosures to be transparent or semitransparent for visibility and security. The bottoms of enclosure partitions should be open for drainage and to prevent the collection of wind-blown debris.
- Situate station amenities on the leeward side of buildings for protection against wind.
- Use existing vegetation on site, such as trees, as buffers against adverse weather. Architectural and landscaping elements can also be used to reduce glare from low horizontal sun angles.
- Protect against building up-draft and the Venturi effect on wind caused by large buildings.
- Ensure that protective devices do not obscure visibility, inhibit security or interfere with patron circulation.

◀ Selected materials should be safe, durable and attractive.

2.2.2.8 MATERIALS & FINISHES

This section discusses design criteria for the selection of materials and finishes for the public areas within the system. Consideration is placed on comfort and attractiveness as well as safety, durability and cost. Refer to Fig. 7 for detailed guidelines on materials selection.

▶GUIDELINES

- Minimize hazards from fire and smoke by using materials with low burning rates and non-toxic characteristics. Materials must comply with all code requirements.
- Ensure proper attachment and bond strengths to reduce hazards from dislodgement due to temperature change, vibration, impact, wind, aging, etc.
- Provide non-slip material at entrance stairways, platform edges and other areas exposed to weather elements.
- Use materials that will provide long and economical service with wear, strength and weathering qualities that resist the effect of abrasion, impact, temperature changes and sunlight. Use only materials whose appearance and color can be maintained throughout their useful life.
- Select materials that are stain resistant, that hide minor soiling and on which casual vandalism can be easily erased with normal maintenance procedures. Materials should be easily cleaned in a single operation with standard cleaning equipment and cleaning agents. Repair and replacement should be considered in the selection of materials.

FIG. 7

TECHNICAL CONSIDERATIONS

▶MATERIALS SELECTION

Stations should be designed to create a feeling of warmth, attractiveness and quality, and to instill in transit patrons a civic pride that will encourage good housekeeping and good behavior.

SURFACE

Materials should be hard, dense, non-porous, non-staining, acid and alkali-resistant for long life and low maintenance. Surfaces within reach of the public, up to 8' above the floor, should be more resistant to damage than is necessary for surfaces above that point.

COLOR

Colors should be predominantly light in tone to aid in maintaining high illumination levels, but with sufficient contrasts and accents to provide visual interest and warmth, as well as to conceal minor soiling.

TEXTURE

Smooth surfaces are preferred over rough ones for ease in cleaning and because they are less prone to catch settling dust. Rough surfaces are desirable where a non-slip feature is important and in areas that are difficult to reach for cleaning, because even though these surfaces may accumulate dust, they will not appear dusty.

UNIT SIZE

Units should be large enough to reduce the number of joints, yet small enough to facilitate replacement if damaged. Monolithic materials may be used if they have inherent soil-hiding characteristics and can be easily repaired in an unnoticeable fashion.

JOINTS

Small, flush joints should be provided. Since joints are a major source of maintenance problems, they should be limited in number and should be of the best possible materials. Horizontal joints should not be raked, but be flush or tooled concave. To prevent cracking, monolithic materials should have adequate control joints and expansion joints at proper spacing. The use of easily damaged joint covers or soft joint filler materials should be avoided.

COST

Costs should be within budget of the station and should be consistent with long life, frequency and expense of maintenance, convenience, replacement considerations and overall aesthetic and functional qualities.

AVAILABILITY

Materials should be provided in sufficient quantity that their delivery and / or installation, whether for one or several stations with concurrent completion schedules, will not involve cost penalties or delays for either materials or labor.

NON-PROPRIETARY MATERIALS

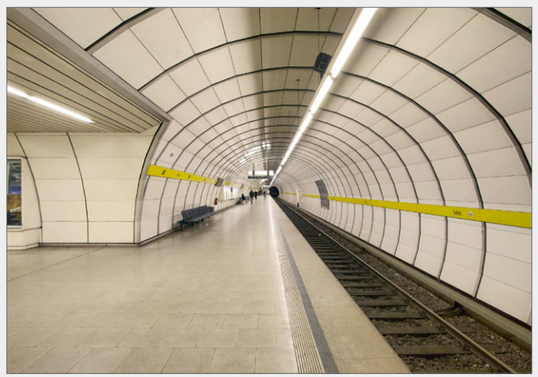
To obtain competitive bids, proprietary items should be used only where it is established that no other materials exist which will meet the particular design requirements. All other items should be specified on a 'performance specification' basis.

INSTALLATION STANDARDS

Materials should be detailed and specified to be installed in accordance with industry standards and the manufacturer's printed directions for long life, low-maintenance installations.

FLAMMABILITY

Interior finishes should meet the requirements of the Uniform Building Code (UBC), Chapter 42, as well as NFPA 130 and all other applicable codes. The finishes for all exit ways should be Class I as defined by the UBC, and Class A as defined by NFPA 130. Platforms, concourses, corridors, stairways and vestibules should be considered exit ways. Finishes in all other areas should be Class II as defined by the UBC, and Class B as defined by NFPA. Combustible adhesives and sealants may be used when they meet the requirements stated above.



◀ Turnstile areas should be large enough to accommodate peak hour volumes.

◀ Secured ancillary facilities must be provided accordingly.

2.2.2.9 FARE COLLECTION & CONTROL

One of first things encountered upon entering a station is the fare collection and control area. These areas may serve single or multiple entrances and are often at or near the confluence of multiple paths of travel. To prevent congestion and confusion, access must be simple, direct and easily navigated, and the space allocated must be sufficiently generous to easily accommodate peak travel volumes – when congestion and passenger confusion are even more likely. Conflicting movements between arriving and departing passengers must be avoided.

The layout of this area is critical, as it presents the potential to create a serious bottleneck in passenger flow through the station. Passengers, especially new or infrequent riders, must orient themselves, read and understand system signage and schedule information, choose their direction of travel, determine the fare required and access passes or money. Riders who hesitate due to confusion tend to stop moving and can create a traffic jam even before they arrive at turnstiles, making it all the more important to provide plenty of space and to arrange information and services with the novice traveler in mind.

▶GUIDELINES

- Queuing distances and space provided for the fare collection area should be based on projected future peak volumes, as opposed to average daily volumes, as smooth passenger flow is most critical at these peak travel times.
- Information displays (schedules, system maps, etc.) should be located as near the station entry as possible and well before the fare gates. At larger stations, duplicates of this information should also be located near the fare gates, but out of the path of travel to allow infrequent or new riders to confirm directions and double check information without blocking other passengers.
- The customer service kiosk should be prominently located with generous queuing space provided on both the 'free' and 'fare paid' sides.
- Lighting, HVAC and structural elements should be located so as not to block travelers' view of information displays.
- Information displays, lighting, HVAC and structural elements should be located well out of reach of passengers.

2.2.2.10 EMPLOYEE & ANCILLARY FACILITIES

Ancillary facilities are the non-public areas that support and sustain transit operations. These facilities are much more likely to be required for underground stations and space should be provided accordingly. Ancillary facilities may include:

- Traction power facilities;
- Station power and electrical rooms;
- Heating, ventilating and air-conditioning (HVAC) rooms;
- Mechanical rooms;
- Storage facilities;
- Maintenance and Janitorial rooms;
- Communications rooms; and
- Transit personnel offices, lounges and restrooms.

▶GUIDELINES

- The design of ancillary and support facilities is contingent upon the functional requirements of the individual spaces and their locations. However, their design must be subordinate to the public transit-related functions of the station.
- Ancillary and support facilities should be provided with secure and restricted access to and from the station's public spaces.
- In general, access points to these facilities should be consolidated to minimize security equipment, simplify access control, and minimize potential disruption of the public space.
- Ancillary facilities should also be located away from platforms, perhaps on mezzanine levels, and near appropriate vertical transportation systems, suitable for staff access and equipment removal and installation.

◀ Secured bike storage facilities will encourage people to use active modes of transportation.

◀ Platforms must provide safe and clear circulation routes between trains and exits.

2.2.2.11 BICYCLE FACILITIES

The use of bicycles to access transit stations should be encouraged, and connections to bike paths and routes should be carefully considered as part of the station planning process. As an incentive to bike riders, easily accessible, well designed and secure facilities should be provided on-site. Also consider providing other services, such as storage facilities for personal belongings, as well as maintenance and repair services.

▶GUIDELINES

- Storage facilities should be covered and situated on a hard, well-drained surface near the station entry, with proper illumination and clear signage.
- Allow sufficient space for expansion of bike storage facilities.
- Avoid conflicts with pedestrians, auto and bus services.
- Provide lockable storage options, including secure stanchions and bicycle lockers.
- Consider security issues and local regulations regarding visual transparency / opacity of storage lockers, etc.
- Provide security monitoring of bicycle storage areas.

2.2.2.12 PLATFORMS

The station platform is one of the most important elements of the station and must be carefully designed. It should provide safe, easily navigated, unobstructed access to and from train loading areas.

Platforms are sized to accommodate specific car lengths, future expansion and the anticipated passenger load levels, site availability and the placement of circulation elements. The platform must accommodate multiple passenger circulation functions including travel along its length, boarding, disembarking, queuing to board, queuing to access elevators, escalators and stairs and waiting for trains.

Due to the presence of large, potentially fast-moving trains, the platform can be a dangerous place and safety is a prime consideration. Passenger safety can be enhanced through the clarity of the physical layout and the size of the platform, as well as through the use of durable, non-slip surfaces, tactile banding at platform edges and other safety features.

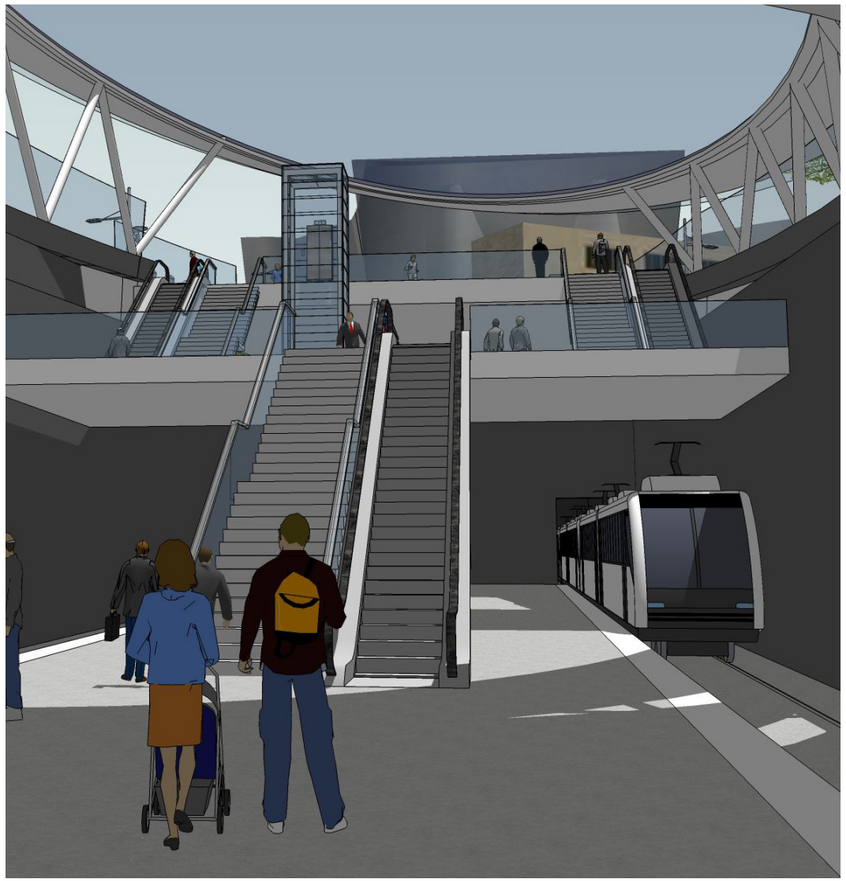
Determining factors in establishing size:

- Train length and anticipated growth;
- Width of vertical circulation elements;
- Clear minimum distances required between platform edge and obstructions;
- Platform safety edge;
- Passenger volumes;
- ADA requirements;
- Additional buffer zone;
- Additional space required during peak travel times;
- Projected increase in passenger volume; and
- Emergency exiting requirements.

▶GUIDELINES

- Avoid conflicting circulation patterns.
- Support safe passenger circulation and access to and from trains.
- Facilitate timely clearing of platform.
- Minimize need for passengers to make decisions on platform, causing hesitation and obstructing flow of traffic.
- Locate access points and vertical circulation elements to evenly distribute vehicle loading and unloading points.
- Minimize visual obstructions, avoid alcoves and hidden areas.
- Ancillary or non-transit functions should not be located on the platform as they may obstruct, inhibit or impede circulation.
- Maintain a clearly delineated, direct path for emergency egress, with easy access to exits or areas of refuge.

◀ Mezzanines increase security by offering opportunities to observe the platform below.



◀ Mezzanines also allow more natural light to filter down to the platform.

2.2.2.13 MEZZANINES

The station mezzanine is one of the primary experiences for transit riders and should provide a welcoming setting that enhances the experience of public transit. The mezzanine also offers the opportunity to present an expression of the station character and the design theme of the transit system through the use of artwork, graphics and other design features.

The mezzanine should ensure the smooth flow of pedestrian traffic, comfortably accommodating multiple passenger circulation routes and facilitating passenger orientation and control. Mezzanines may contain ticket purchase and fare collection turnstiles, directional signage and transit system information, as well as non-public or ancillary spaces such as station agent business centers and security control mechanical and ventilation equipment.

Some influences on mezzanine location include the number of entrances, passenger volume, platform length and code requirements. In some cases, multiple mezzanines may be required.

▶GUIDELINES

- The mezzanine should be bright, airy, open, spacious and filled with natural light.
- Establish a strong visual connection between the mezzanine and the platform to assist in passenger orientation.
- Provide clear, unobstructed access to and from station platforms.
- Access points and vertical circulation elements should be conveniently located.
- Ensure sufficient space is provided to accommodate peak periods and projected growth in ridership.
- Allow sufficient queuing space at elevators, stairs and escalators.
- Minimize travel distances and the number of horizontal and vertical transitions.
- Separate opposite passenger flows when possible.
- Minimize the need for passengers to make decisions on the platform, causing hesitation and obstructing traffic flow.
- Maintain clearly delineated, direct paths for emergency egress, with easy access to exits or areas of refuge.

2.2.2.14 UNDERGROUND CONNECTIONS

Underground connections link remote entries to the station. Their primary advantage is that they can slightly extend the 'reach' of a station and provide an alternate means of access, allowing some passengers to avoid crossing busy streets.

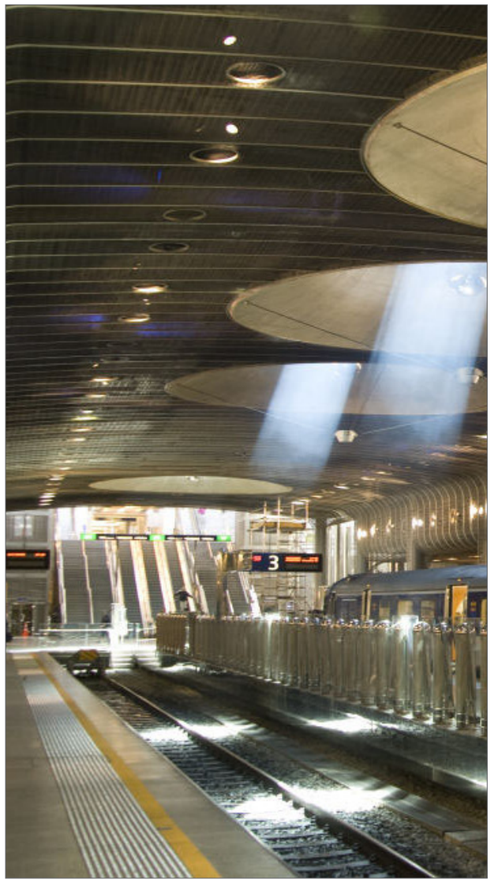
However, by 'removing' transit riders from the street level, and allowing passengers to disperse from the station without engaging in street activity, underground connections can dilute pedestrian activity in the proximity of the station, compromising the effectiveness of casual supervision ('eyes on the street') and actually diminishing pedestrian safety. Moving people from the more open, active street into a tunnel may also have a negative effect on local retail and services and ultimately on the vitality of the station area.

Tunnels also increase the cost of a station and while they may seem to help 'solve' the problem of getting people across a busy street, the same dollars spent on upgrading the streetscape and improving the pedestrian crossing experience may have a much more positive impact on the pedestrian environment.

Tunnels, especially in off-peak travel times, can also be dangerous and care must be taken to include security monitoring equipment, further adding to station cost. If provided, tunnels must be large and bright enough to feel safe and to provide as positive an experience for the transit user as possible.

Unfortunately, while underground connections may seem to offer convenience and safety, they have more negative impacts than positive. For these reasons, pedestrian tunnels should be avoided whenever possible.

◀ Combine artificial and natural light to improve station aesthetics.



◀ (Left) Natural lighting can make underground stations feel larger than they are in reality; (Right) Proper lighting increases safety at night.

◀ Example of on-street solar lighting.

2.2.2.15 LIGHTING

Proper illumination of a site requires both natural and artificial light. When used in conjunction with one another, they can provide high quality, efficient lighting. Lighting levels are dependent on the needs of the particular function being illuminated, the availability and quality of natural light, the intensity of fixtures used and the hours of operation. Site lighting should enhance the quality of the facility both functionally and aesthetically.

▶GUIDELINES

- Conform electrical design to the latest editions of all appropriate applicable standards and codes.
- Identify and satisfy appropriate levels of illumination for all site functions (see Fig. 8 for details).
- Ensure that the light and lighting elements are acceptable for their intended use and physical context.
- Provide proper lighting of all platforms, waiting areas, circulation paths and parking areas to deter criminal activity.
- Illuminate any dangerous site elements (eg. stairs, ramps, platform edges).
- Explore the use of natural light and natural lighting elements. Natural and artificial lighting should be used in conjunction to develop an aesthetically pleasing lighting scheme.
- Consider whether lighting infringes upon neighboring uses. Buffering or shielding elements can be utilized to resolve certain conflicts.
- Establish a system-wide standard bulb, and possibly fixture type, to promote energy savings and cost efficiency.
- Design fixtures and electrical service to meet both long and short-term energy conservation goals.

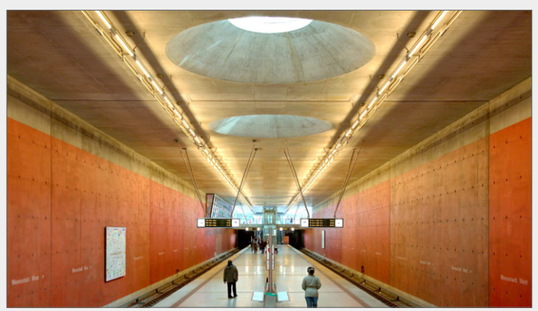
FIG. 8

TECHNICAL CONSIDERATIONS

▶ILLUMINATION LEVELS

Minimum average maintained illumination levels for various areas should be as indicated in the tables based on an update to the Design Criteria. Maintained foot-candle values should be measured as follows:

- For train-ways, in a horizontal plane at the tunnel floor.
- For site and above-grade station areas, in a horizontal plane at-grade.
- For all others, in a horizontal plane 30" above the finished floor.



◀ Proper signage is visible and conveys information quickly.

◀ Signage gives clear directions for complicated information.

◀ An example of a clearly identified emergency evacuation route.

2.2.2.16 SIGNAGE

Signage consists of all graphics and visual images provided to direct or convey information about a facility to its patrons. Signage should clearly and quickly convey information about a site or facility. It must be legible, consistent, sequential and appropriate. There are three basic types of signage:

- **Systems & Information Signage:** To identify the transit system and inform patrons of its operations.
- **Station Signage / Wayfinding:** To inform, direct or alert patrons to site facilities.
- **Advertising:** Space rented to private companies as a revenue source for the system.

▶GUIDELINES

- Refer to Metro's Design Criteria to determine the exact placement, height and structural support system for systems and information and wayfinding signage.
- Ensure ability of signage to convey information quickly and clearly. Signs should conform to the following criteria for legibility:
  - » Signage must be simple, clear and concise for quick identification.
  - » Pictographic signage, such as international symbols, should be used for basic functions (eg., restrooms, directory, etc.).
  - » Text signage must be of appropriate size, color and contrast from its background to be legible. Appropriate signs should be designed to standards for the visually impaired.
  - » Signage must be located and illuminated so as to be easily read with minimal distraction from other elements.
- Standardize signage to ensure consistent size, shape, color and content throughout the system.
- Locate signage for similar functions at consistent locations from site to site.
- Utilize a modular system where practicable to contribute to clarity and consistency as well as enabling ease of placement, modification, maintenance and repair.
- Consider the prevalent direction of pedestrian movement so that signage may be arranged in appropriate sequence.
- Position signage at or before points of decision and organized in a pattern that is predictable from station to station.
- Use signage of appropriate character to create harmony with the station and site design.
- Allow signage to take precedence over artwork where conflicts occur.
- See Fig. 9 for more details concerning site-specific signage.

FIG. 9

TECHNICAL CONSIDERATIONS

▶SITE-SPECIFIC SIGNAGE

STATIONS

- Primary Information
- Station Entrances
- Ticket Dispensers
- Patron Routes to Platforms
- Station Identification (Platform)
- Secondary Information
- System Use Instructions
- Transit Interconnections
- Services (Telephones, etc.)
- Routes to Other Facilities (Concessions, Hotels, etc.)
- Escalator / Stair Directives
- Exit Routes
- Handicapped Routes
- Entry / Use Restrictions
- No Smoking
- Emergency Equipment

STATION SITES

- Bus or Other Public Transportation Modal Interfaces
- Kiss-and-Ride Facilities
- Park-and-Ride Facilities
- Taxi Zones
- Surrounding Traffic Patterns and Requirements
- Adjacent Buildings and Uses

SYSTEM SYMBOL & OFF-SITE SIGNAGE

- Legends
- Station Identification
- Vehicle Destinations
- Fare Zones
- Systems Use Instructions
- Exit Routes
- Routes to Other Facilities
- Pictograms
- Feeder Bus / Other Transit Mode Interconnections
- Entrance Routes
- Services (Telephone, etc.)
- Handicapped Routes
- Escalator / Stairs Directives
- Entry Restrictions
- Restrooms
- No Smoking

◀ Seating can be functional as well as aesthetically pleasing.

◀ Public art brings creativity and culture into transportation systems.

2.2.2.17 SEATING

Although the stay at each station is transient in nature, the amenities provided should enhance the use of the system and encourage continued patronage (see. Fig. 10). Aside from offering necessary comfort and convenience, seating and other station furnishings should add color and visual appeal to the station environment.

▶GUIDELINES

- Employ modular or standardized systems to ease maintenance, repair and replacement of items.
- Discourage seating use as a sleeping platform.
- Select sloped, perforated or folding seating to avoid catching rainwater and spilled liquids.

2.2.2.18 PUBLIC ART

Artwork integrated into the design and development of stations and sites mitigates the adverse impacts related to construction, enhances the environment and promotes public acceptance of and appreciation for the transit system.

▶GUIDELINES

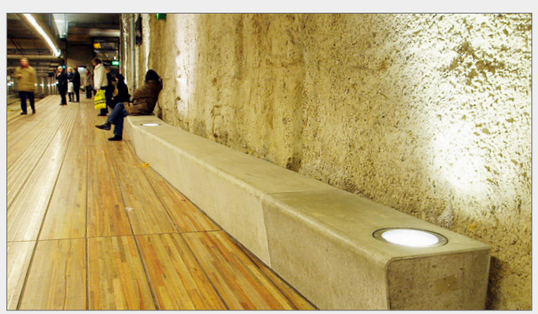
- Use local public art resources to promote city interests. Work with local arts committees and community representatives to review all art. Assist artists in designing technically competent artwork, which can be placed in the public environment. Refer to Metro's Public Art Program for more information.
- Include artists on the station design team to identify opportunities early in the station design process and integrate artwork seamlessly into the design.
- Develop a comprehensive policy toward defining the artwork program as related to the rail system.
- Develop a methodology for estimating the cost of artwork and managing the artwork budget.

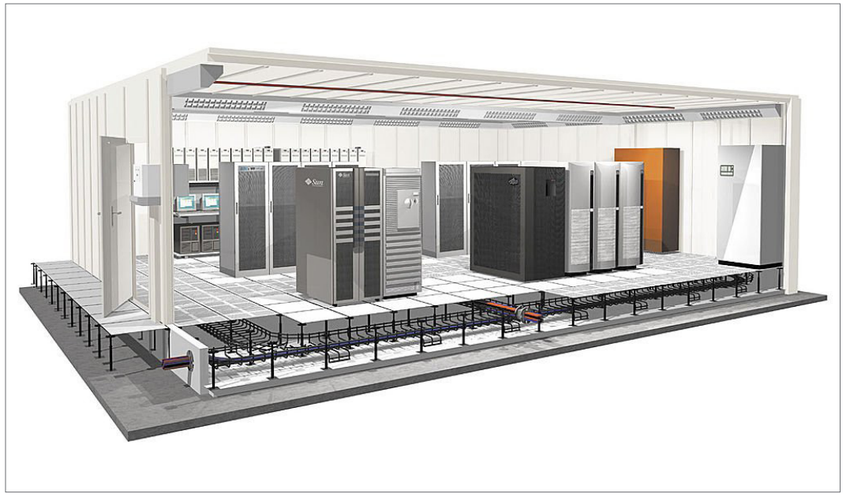
FIG. 10

TECHNICAL CONSIDERATIONS

▶STATION FURNITURE

- Seating
- Leaning Rails
- Trash Receptacles
- Bike Racks / Lockers
- Phone Booths
- Automatic Teller Machines (ATMs)
- Newspaper Dispensers
- Ticket Kiosks
- Advertising Display Framework
- Wind Screens
- Electronic Signage
- Pamphlet Dispensers





◀ Adequate staff and security facilities contribute to a well-managed transit system.

◀ Staff ticket booths should be well-lit, ventilated and comfortable.

2.2.2.19 SUPPORT FACILITIES

Support facilities include all ancillary functions necessary for the operations of the rail transit systems which require physical accommodations (see Fig. 11). Certain functions can be accommodated with standard modules and these can be assigned to specific station locations.

▶GUIDELINES

- Provide requirements for ancillary structures necessary to station and transit system operation.
- Utilize a planning module in designing all support facilities to facilitate standardization of components and furnishings, to save costs and to provide design consistency among stations.
- Ensure the planning module is a minimum 8' × 8' dimension. Depending upon functional requirements, the module may be increased in 4' increments. A standardized module can accommodate a variety of functions.

2.2.2.20 RETAIL / VENDING

A retail facilities plan associated with transit facilities will be established by Metro. Specific vending policies are not established.

FIG. 11

TECHNICAL CONSIDERATIONS

▶SUPPORT FACILITY TYPES

STAFF SECURITY ROOMS
Located at subway stations and specific designated stations. These rooms are located directly off the concourse in an inconspicuous location with a view of the fare vending area.

COMFORT STATIONS
Located at terminus and intermodal transfer stations; these rooms provide toilet facilities for staff and transit operators and will be located at selected stations.

CUSTODIAL ROOMS
Custodial rooms are required at each subway station and selected aerial or at-grade stations.

TRASH ROOMS
Trash rooms are required at each subway station and should be located at the mezzanine level adjacent to the elevator, and (as required), at selected aerial and at-grade stations.

◀ (Left) Air conditioning and heating shafts should be on the roof of transit stations or hidden from view; (Right) Bike racks can be stationed on top of exposed ventilation grates on the ground.

◀ Stations can be designed to provide natural ventilation with minimal equipment, like this station in Tokyo, Japan.

2.2.2.21 MECHANICAL EQUIPMENT

This section outlines general criteria related to functional and design requirements for the Environmental Control Systems (ECS) to provide Heating, Ventilating and Air Conditioning (HVAC) for the rail system with the goal of promoting uniformity of design and to standardize mechanical components of the Metro rail system (see Fig. 12). Mechanical criteria will cover the design of the following ECS:

- Ventilating;
- Heating;
- Air conditioning;
- Drainage for track and inside structures;
- Gratings and miscellaneous metals;
- Fire protection systems;
- Plumbing;
- Escalators; and
- Elevators.

▶GUIDELINES

- Ensure the design complies with local, state and national codes. The general standards for transit design are contained in the requirements of the National Fire Protection Association (NFPA) Standard 130, Fixed Guideway Transit Systems. Design will follow the most stringent of applicable codes and / or industry practices.
- Maintain an acceptable environment for patrons, operators and maintenance personnel by providing HVAC systems for ancillary rooms, subway station platforms, concourse areas, mezzanines and concession areas. These HVAC systems should also prolong the life of equipment through proper control of temperature, pressure and humidity.
- Design the ventilation system to not only offer a healthy and comfortable atmosphere for patrons, but also to provide environmental control in the event of an emergency. In achieving these ends, the system should not be intrusive at the surface level. Thus, the ventilation system should provide for the following:
  - » Supply of fresh air.
  - » Removal of heat and control of air temperatures.
  - » Control and removal of heat, smoke and fumes during an emergency to provide safe evacuation and assist in fire control.
  - » Minimum environmental impact at the surface.

FIG. 12

TECHNICAL CONSIDERATIONS

▶ENVIRONMENTAL CONTROL SYSTEMS

Environmental control systems to control temperature, air velocity, rate of air pressure change, dust, odors and the spread of smoke during fire emergencies should be provided as prescribed here.

AT-GRADE STATIONS

HVAC systems should be provided for the ancillary rooms and for concession areas. ECS will not be provided for patron areas unless:

- The architecture of the station requires ventilation for smoke control; or
- The ECS is part of a joint development project.

SUBWAY STATIONS

HVAC systems for platform and mezzanine areas, concession areas, and the ancillary rooms should be provided. An under-platform exhaust (UPE) system could be provided to supplement emergency ventilation and to capture a portion of the heat released by the trains in stations during both normal and congested operations.

SUBWAY TUNNEL

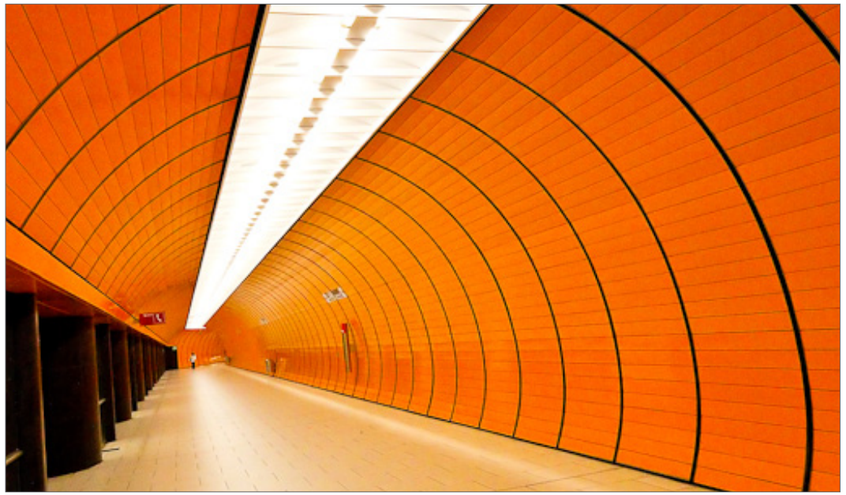
Emergency ventilation shafts that terminate at or above grade at each end of the station and between two stations should be provided. The ventilation shafts should be equipped with reversible fans, fan dampers, sound attenuators and bypass dampers for forced ventilation during congested or emergency operations. Tunnel booster fans should be provided so that the effects of airflow short-circuiting from tunnel to tunnel are reduced during both congested and emergency operations.

MISCELLANEOUS WAYSIDE STRUCTURES

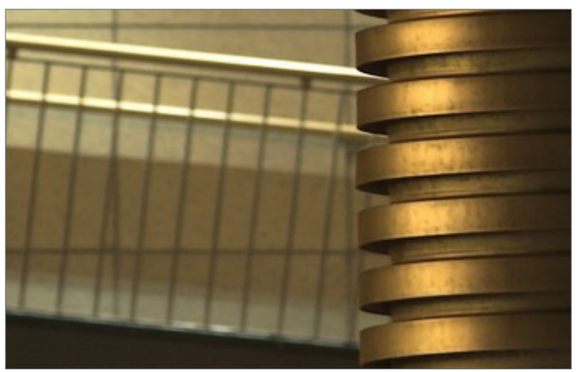
HVAC systems should be provided for the ancillary rooms in miscellaneous wayside structures.

TRACTION POWER SUBSTATIONS

HVAC systems should be provided for traction power substation structures and rooms.



◀ Electrical systems must power standard lighting as well as emergency lighting.



2.2.2.22 ELECTRICAL

This section outlines general criteria related to functional and design requirements for the electrical systems required for underground and at-grade stations, as well as support facilities (see Fig. 13). These guidelines have the goal of promoting uniformity of design and standardization of electrical components in the system. Electrical criteria will cover the design of the following facilities:

- Electrical distribution (3 phase primary) system;
- Lighting;
- HVAC systems;
- Emergency power substation systems;
- Traction power subway substation auxiliary power connections;
- Maintenance yards and shops;
- Elevators and escalators;
- Fare vending;
- Illuminated signing;
- Public telephones;
- Grounding system;
- Lighting protection system;
- Supervisory and control systems;
- Raceway systems;
- Power to signal and communications facilities; and
- Provisions for future growth in the system.

▶GUIDELINES

Electrical design should conform to the latest editions of all appropriate applicable standards and codes (refer to the International Building Code [IBC] and local and state regulations for more information).

FIG. 13

TECHNICAL CONSIDERATIONS

▶INCOMING ELECTRICAL SERVICE REQUIREMENTS

The required electrical energy for the auxiliary power and lighting systems of Metro facilities will be furnished by a single power source. Two primary feeders should serve each subway station and the train control center. One primary feeder should serve each aerial and at-grade facility (see Support Facilities). Each passenger station should have a facility power supply room. Traction power substations will have separate utility power sources.

ELECTRICAL LOADS

Electrical loads connected to auxiliary power equipment should be defined as either non-essential or emergency.

Non-Essential Loads: Non-essential loads are loads which, if de-energized, would have minor effect on patron safety and no effects on system safety.

Essential Loads: Essential loads are loads which, if lost, would have a detrimental effect on patron and / or system safety. See National Fire Protection Association (NFPA) Standard 130 for more information.

ELECTRICAL DISTRIBUTION

General: Primary feeder power should be transformed where required to the nominal A80/277 volts for distribution.

Unit Substation Service: Entry from the utility company should contain a primary-fused disconnect switch or a circuit breaker for the utility primary at '0480/277 volt dry-type transformer. Where it is feasible, 480/277 volt three-phase power can be supplied from the utility company directly to the switchgear without the need of transformers.

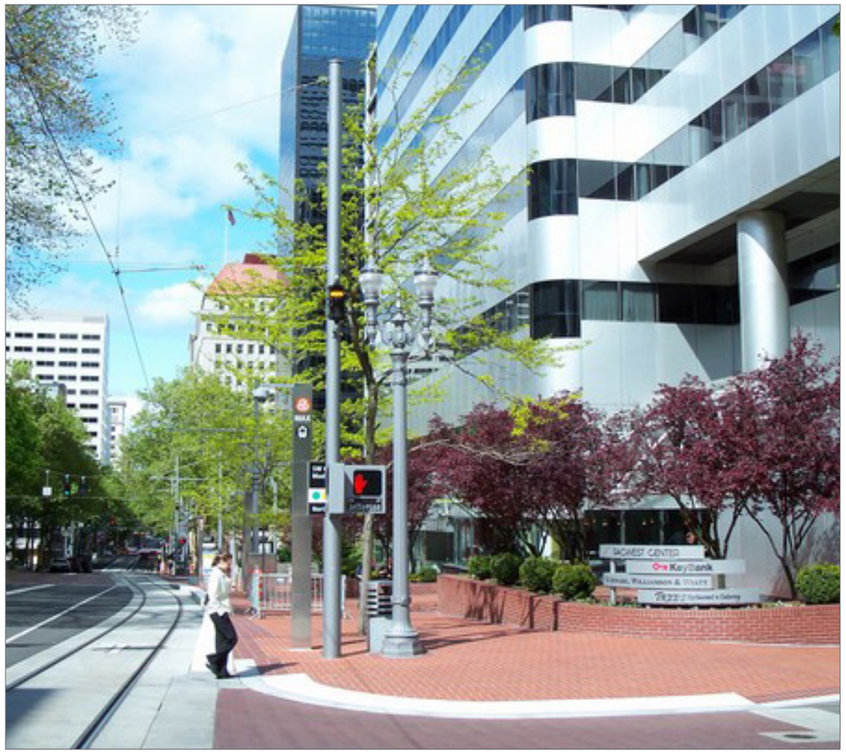
EMERGENCY POWER SYSTEMS

Train Control Center: The emergency power system for the train control center should meet the requirements of station Signaling Systems (NFPA 71) and utilize an uninterruptible power supply (UPS).

Subway Stations: Subway stations should include emergency power systems:

- An uninterruptible power supply.
- An uninterruptible power supply for a part of the emergency lighting (in the public areas of station only), including emergency exit stair lights and exit signs.
- A standby engine-generator capable of supplying essential power loads and all emergency lighting in the station as well as emergency functions (eg. sump station for tunnel) normally supplied from that station.

◀ Physical cues, materials and textures help create successful urban environments.



◀ Landscaped intersection.

2.3 LANDSCAPE ARCHITECTURE

Landscape architecture is a synthesis of arts, sciences, technical philosophies and practices that seek to care for people in a holistic, creative and sustainable manner. While these guidelines attempt to address all of the philosophies and practices to some degree, the 'tool kit' emphasizes the design of the urban environment in regard to the health, safety and welfare of the citizens and visitors of Los Angeles. The ultimate goal is to improve the pedestrian environment by defining a safe, contextually integrated transportation system that is efficient, convenient and facilitates the concept of stimulating and creating an extraordinary downtown urban environment.

2.3.1 LANDSCAPE ARCHITECTURE PRINCIPLES

2.3.1.1 IMPROVED VISUAL CUES & WAYFINDING

Many physical elements are orchestrated to improve visual cues, wayfinding and create a successful urban environment. Street trees, sidewalks, lighting, comfortable seating, legible signage and other amenities are components of the composition that create a safe, well-defined and enjoyable environment for people. Several of the basic design concepts considered when creating such an environment include line, form, texture, color, variety, rhythm, harmony, balance, emphasis and light.

2.3.1.2 SUSTAINABILITY

Sustainable design is the philosophy and practice of designing the built environment and planning for public services to comply with the principles of economic, social and ecological sustainability.

The values of sustainable design include:

- Meet the needs of the present without compromising the quality of life of future generations.
- Maintain economic growth while producing an absolute minimum of pollution, repairing environmental damages of the past, producing less waste and extending opportunities to live in a pleasant and healthy environment.
- Meet human needs by maintaining a balance between development, social equality, ecology, and economics.
- Demand systematic consideration to a project's environmental impacts, energy use, natural resource consumption and economic and social implications.
- Realize that sustainability is best addressed at the inception of a project and continues to be relevant throughout the planning, programming, design, construction, and ownership phases.

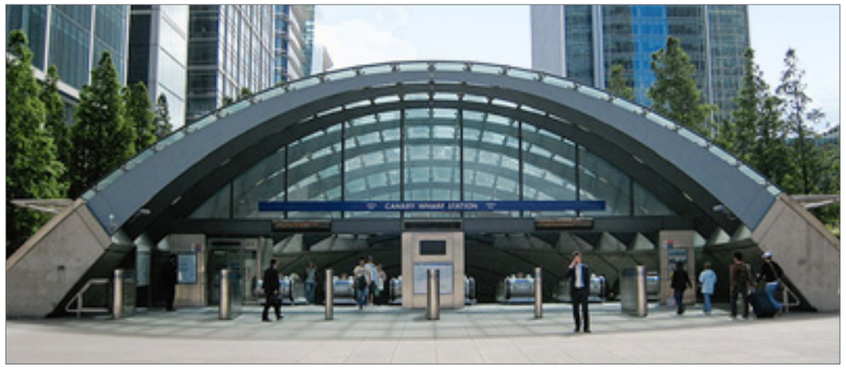
The 'Green Street' concept is an instrumental element of the proposed Regional Connector Transit Corridor project. 'Green Streets' are a sustainable stormwater strategy that meets regulatory compliance and resource protection goals by using a natural systems approach to manage stormwater, reduce flows, improve water quality and enhance watershed health *(Source: Portland Bureau of Environmental Services)*.

2.3.1.3 CLIMATE-APPROPRIATENESS

Los Angeles' favorable marine climate encourages the indoor-outdoor relationship of people, their dwelling spaces and their environment. The Sunset Western Garden Book defines the Los Angeles Downtown area as Zone 23 and is one of the most favored garden climates in North America for the growing of subtropical plants. The climate is characterized by an air- drained thermal belt with 85% of the seasonal conditions being influenced by the Pacific Ocean and 15% from the Interior (Santa Ana winds). The winter season includes minimal frost and low temperatures range from 38 – 23°F. The USDA Plant Hardiness Zone Map defines the area as zone 9A with an average annual minimum temperature of 20 – 26°F. The lowest recorded temperature at the Los Angles Civic Center is 28°F.

The 'Green Street' concept is an instrumental element of the proposed Regional Connector Transit Corridor project.

◀ Streetscape



◀ Station Entrance

◀ Train Portal Structure

2.3.2 LANDSCAPE ARCHITECTURE COMPONENTS

2.3.2.1 STATION AREAS & STREETSCAPES

The three major components of the Regional Connector are: (1) Stations and Station Entrances; (2) Train Portal Structures; and (3) Streetscapes.

▶STATIONS & STATION ENTRANCES

Landscape architectural spaces that are typically associated with stations and station entrances include plazas and pocket parks. Plazas are typically an open urban public space, similar to a city square or a large courtyard and are usually surrounded by buildings. Plazas adjacent to stations are a gathering or focal point for human activity and the primary use is to safely and efficiently facilitate the circulation of pedestrians to and from the station. Additional uses may include retail sales, passive recreation and cultural events. Pocket parks are small parks accessible to the public that provide greenery, passive recreation and sometimes a children's playground. Parks may be created to enhance a monument, historic marker or an art project. Parks also provide areas for wildlife habitat.

LAYOUT

The recommended layout of a pedestrian area (sidewalk or plaza adjacent to the street) at the street level includes an access zone, a continuous 'walkway zone', a parkway zone and depending on adjacent land uses may include a 'transitional or amenity zone'.

The access zone is 18" – 24" from the face of the curb including a 6" curb and a masonry, often granite or brick band. The parkway zone is adjacent to the access zone and is ideally a continuous 'green street' stormwater treatment system designed to collect, retain or treat runoff. The parkway zone may integrate and include site furnishings. The 'transition or amenity zone' may include landscape planting and site furnishings depending on adjacent land uses.

STATION & STATION PORTAL PLANTING MATERIAL GUIDELINES

The following are guidelines unique to stations and are in addition to the General Landscape Planting Material Guidelines:

- Trees may be planted with regular spacing and / or in straight rows to define and direct pedestrian routes, draw attention to the plaza and frame views out of the plaza.
- Extend the plaza tree configuration into the adjacent right of way (ROW) or streetscape for continuity.
- Plant trees in quantity to provide shade and cool the area.
- Plant trees to define the public space or spaces.
- Plant a single species or trees that are similar in character for definition and special effect.
- Some variety in the selection of species may be appropriate to provide additional color, texture and fragrance.

▶TRAIN PORTAL STRUCTURES

The train portal structure defines the transitional space of the train tunnel from below-grade to above-grade. Landscape design for these areas is both ornamental and functional. Safety is the greatest concern around portals and ultimately deterring pedestrian circulation away from a train portal is preferable.

LAYOUT

The recommended landscape layout of a train portal structure is primarily a landscape zone. Formal geometry that creates a bold statement is recommended to harmonize with the urban landscape.

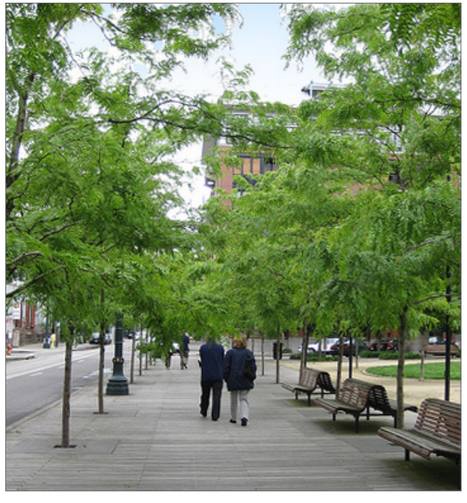
PLANTING MATERIAL GUIDELINES

The following are guidelines unique to train portal structures and are in addition to the General Landscape Planting Material Guidelines:

- Trees should be formally planted in a bosque and draw attention to the presence of the portal.
- Trees may relate to adjacent street trees in regard to layout but vary significantly in shape, color and texture to draw attention.

◀ Pedestrian streetscape with adjacent plaza.

◀ Examples of raised streetscape planter strips.



◀ Examples of different pedestrian streetscape treatments.

- Visual screening of unsightly views and noise buffering with shrubs should be sought.
- Screening and / or fencing with shrubs can add to safe circulation around or away from portals.
- The portal may present opportunities to integrate 'green street' applications.

▶STREETSCAPES

The streetscape is the composition of elements in and adjacent to a street that defines the urban form and includes elements such as building forms and styles, landscape materials, street furniture, paving etc. The streetscape along the Regional Connector and the adjacent streetscapes are the unifying element of the project that integrates all other urban design components.

LAYOUT

Streetscapes may include adjacent plazas and pocket parks and include the following recommended zones:

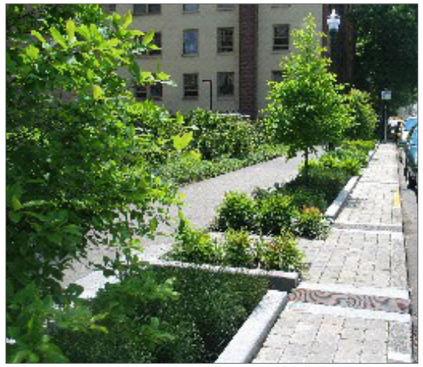
- An 'access zone' immediately adjacent to the curb;
- A 'parkway zone';
- A continuous 'walkway zone'; and
- Depending on adjacent uses, may include a 'transitional or amenity zone'.

The access zone is a minimum 18" – 24" from the face of the curb including a 6" curb and a masonry, often granite or brick band. The parkway zone is adjacent to the access zone and is, ideally, a continuous 'green street' stormwater treatment system designed to collect, retain or treat stormwater runoff. The parkway zone may however integrate and include site furnishings. The transition or amenity zone may include landscape planting and site furnishing depending on the adjacent land uses.

PLANTING MATERIAL GUIDELINES

The following are guidelines unique to streetscapes. Otherwise, please see the General Planting Material Guidelines for further direction.

- Trees should have the same characteristics on both sides of the streets.
- A planting strip may be appropriate in a streetscape taking the form of a large area between the sidewalk and the curb and where pedestrian circulation volumes are low and a 'green street' planter is not applicable.
- In addition to trees, the streetscape planting strip may include shrubs, groundcovers and turf (turf is recommended to be used sparingly or in a very unique design solution).
- Planting strips should be at least 5' wide to accommodate irrigation systems and to provide adequate room for healthy tree root systems.
- For planter strips that are less than 5' wide and where 'green street' planters are not an option, groundcovers or paving may be considered. Preferred groundcover widths are between 2' to 4'. Pervious paving is recommended where widths are less than 2' and where pedestrian traffic occurs.
- Streetscape planter strips should not be elevated above curbs except to provide positive drainage.



◀ Raingardens collect water from impervious surfaces to support landscaped planters.

◀ Green roofs absorb energy from the sun and cool the building below.

◀ Green walls give character to otherwise blank surfaces.

2.3.2.2 ECO FEATURES

▶'GREEN STREET' INFILTRATION PLANTERS OR RAINGARDENS

A raingarden is a planted depression or swale that allows rainwater runoff to be absorbed from impervious urban surfaces like roofs, driveways, walkways and compacted lawn areas. Runoff is reduced by allowing stormwater to soak into the ground 'on-site' instead of flowing into storm drains and surface waters which promote erosion, water pollution, flooding and diminished groundwater.

Native plants are recommended for raingardens primarily for maintenance purposes as they generally don't require fertilizer and are more tolerant of the local climate, soil and water conditions. A selection of wetland edge vegetation, such as wildflowers, sedges, rushes, ferns, shrubs and small trees, absorb excess water flowing into the raingarden. Water filters through soil layers before entering the groundwater system. Root systems enhance infiltration, moisture redistribution, and diverse microbial populations involved in biofiltration. Also, through the process of transpiration, raingarden plants return water vapor into the atmosphere.

Ferns, grasses – especially 'native' grasses – and sedges are excellent plant materials for a raingarden. These plants love the sun and can exist in a variety of shapes, sizes and shades of green. Ferns require specific consideration as they require shade from a street tree, structure or building.

▶ECOROOF – GREEN ROOF

A green roof is a roof of a building or structure that is partially or completely covered with a vegetation system. The system is typically composed of sedum, herbs, grasses and / or bulbs. The plants grow in a layer of engineered growing medium or soil. The vegetation and medium are contained by a waterproofing membrane and may also include additional layers such as a root barrier and drainage and may include an irrigation system.

▶GREEN WALL

There are two major categories of green walls: (1) green façades; and (2) living walls.

Green façades are wall systems where climbing plants or cascading groundcovers are trained to cover specially designed supporting structures. Plant materials can be rooted at the base of the structures, in intermediate planters or on rooftops. Green façades can be attached to existing walls or built as freestanding structures. Living walls (also called biowalls, 'mur' vegetal or vertical gardens) are composed of pre-vegetated panels or integrated fabric systems that are affixed to a structural wall or frame. Modular panels can be comprised of polypropylene plastic containers, geotextiles, irrigation and growing medium and vegetation. This system supports a great diversity of plant species, including a mixture of groundcovers, ferns, low shrubs, perennial flowers and edible plants. Living walls perform well in full sun, shade and interior applications, and can be used in both tropical and temperate locations.

Based on current applications and data from the experience of green roofs, green walls can offer considerable cost savings to both the public and private sectors. For example, the reintroduction of vegetation into cities has been correlated with the reduction of the urban heat island effect, and therefore will reduce energy consumption. Cities are cooler and quieter through shading, evaporative transpiration and the absorption of sound by green walls *(Source: Things You Need to Know About Green Walls, By Randy Sharp, MBCSLA, MCSLA, ASLA, LEED AP, July 1, 2007, Building Design and Construction)*.

▶BIOSWALES

'Urban' bioswales are landscape elements designed to remove silt and pollution from surface runoff water. They consist of a swaled drainage course with gently sloped sides (less than 6%) and filled with vegetation, compost and / or riprap. The waters flow path, along with a wide and shoulder ditch, is designed to maximize the time water spends in the swale, which aids the trapping of pollutants and silt. Depending upon the geometry of land available, a bioswale may have a meandering or almost straight channel alignment. Runoff from a bioswale is typically conveyed to a stormwater system.

▶PLANT MATERIALS
